Table of Contents

Instructions

Supporting Documents: RHPs shall refer to Attachment I (RHP Planning Protocol), Attachment J (RHP Program Funding and Mechanics Protocol), the Anchor Checklist, and the Companion Document as guides to complete the sections that follow. This plan must comport with the two protocols and fulfill the requirements of the checklist.

Timeline:

HHSC Receipt Deadline	What to submit	How to submit
10:00 am Central Time, October 31, 2012	Sections I, II, & III of the RHP Plan & Community Needs Supplemental Information	Submit electronically to HHSC Waiver Mailbox
5:00 pm Central Time, November 16, 2012	Pass 1 DSRIP (including applicable RHP Plan sections, Pass 1 Workbook, & Checklist)	Mail to address below
5:00 pm Central Time, December 31, 2012	Complete RHP Plan (including RHP Plan, Workbooks, & Checklist)	Mail to address below

All submissions will be date and time stamped when received. It is the RHP's responsibiility to appropriately mark and deliver the RHP Plan to HHSC by the specified date and time.

Submission Requirements: All sections are required unless indicated as optional.

The Plan Template, Financial Workbook, and Anchor Checklist must be submitted as electronic Word/Excel files compatible with Microsoft Office 2003. RHP Plan Certifications and Addendums must be submitted as PDF files that allow for OCR text recognition. Please place Addendums in a zipped folder.

You must adhere to the page limits specified in each section using a minimum 12 point font for narrative and a minimum 10 point font for tables, or the RHP Plan will be immediately returned.

Mailed Submissions: RHP Packets should include one CD with all required electronic files and two hardbound copies of the RHP Plan (do not include hardbound copies of the finanical workbook).

Please mail RHP Plan packets to:
Laela Estus, MC-H425
Texas Health and Human Services Commission
Healthcare Transformation Waiver Operations
11209 Metric Blvd.
Austin, Texas 78758

Communication: HHSC will contact the RHP Lead Contact listed on the cover page with any questions or concerns. IGT Entities and Performing Providers will also be contacted in reference to their specific Delivery System Reform Incentive Payment (DSRIP) projects.

Section I. RHP Organization

Section I. RHP Organization

Please find below the list the participants in RHP 9 by type of participant.

RHP Participant Type	**Texas Provider Identifier** (TPI)	**Texas Identification Number** (TIN)	**Ownership Type** (state owned, non-state public, private)	**Organization Name**	**Lead Representative**	**Lead Representative Contact Information** (address, email, phone number)
Anchoring Entity *(specify type of Anchor, e.g. public hospital, governmental entity)*						
Hospital District, Public Hospital	127295703	1756004221 4 002	Non-state public	Dallas County Hospital District (d/b/a Parkland Health & Hospital System)	Ted Shaw Interim Chief Financial Officer	5201 Harry Hines Blvd. Dallas, TX 75235 ted.shaw@phhs.org 214.590.8097
IGT Entities *(specify type of government entity, e.g. county, hospital district)*

Section II. Executive Overview of RHP Plan

Section II. Executive Overview of RHP Plan

The organizations and individuals that comprise the Regional Healthcare Partnership for Region Nine have welcomed and invested deeply in the development of this plan to transform the healthcare delivery system serving RHP 9's three counties: Dallas, Denton and Kaufman. RHP 9 participants have spent countless hours considering the community's needs and challenges, understanding the goals of the 1115 Waiver demonstration, and developing concepts, vetting ideas and refining collaborative strategies that will best serve this region.

Summary of Existing RHP Healthcare Environment

RHP 9, consisting of Dallas, Denton and Kaufman counties has an estimated 2010 total population of 3,134,103[1], of which approximately 75 percent reside in Dallas County. In 2011, of the total population in the three counties, approximately 40 percent[2] (or 1.25 million) live at or below 200 percent of poverty. Of this low income population, approximately 85 percent reside in Dallas County. Accordingly, the Region Nine RHP serves the very large vulnerable population intended to be at the center of this transformational waiver program.

The North Texas health care delivery market is dominated by several large health systems. While the systems are expanding into growing suburban markets, they maintain major flagship hospitals in Dallas County. These continue to attract a large number of patients from surrounding counties and regions. RHP 9 health care system hospitals and physicians are increasingly working together to address development opportunities as accountable care organizations, prompting greater focus on care coordination and integration across the care continuum. Inclusion of the community mental health centers and local health departments as participants in the RHP 9 plan has yielded greater interface and collaboration among the entire region's performing providers.

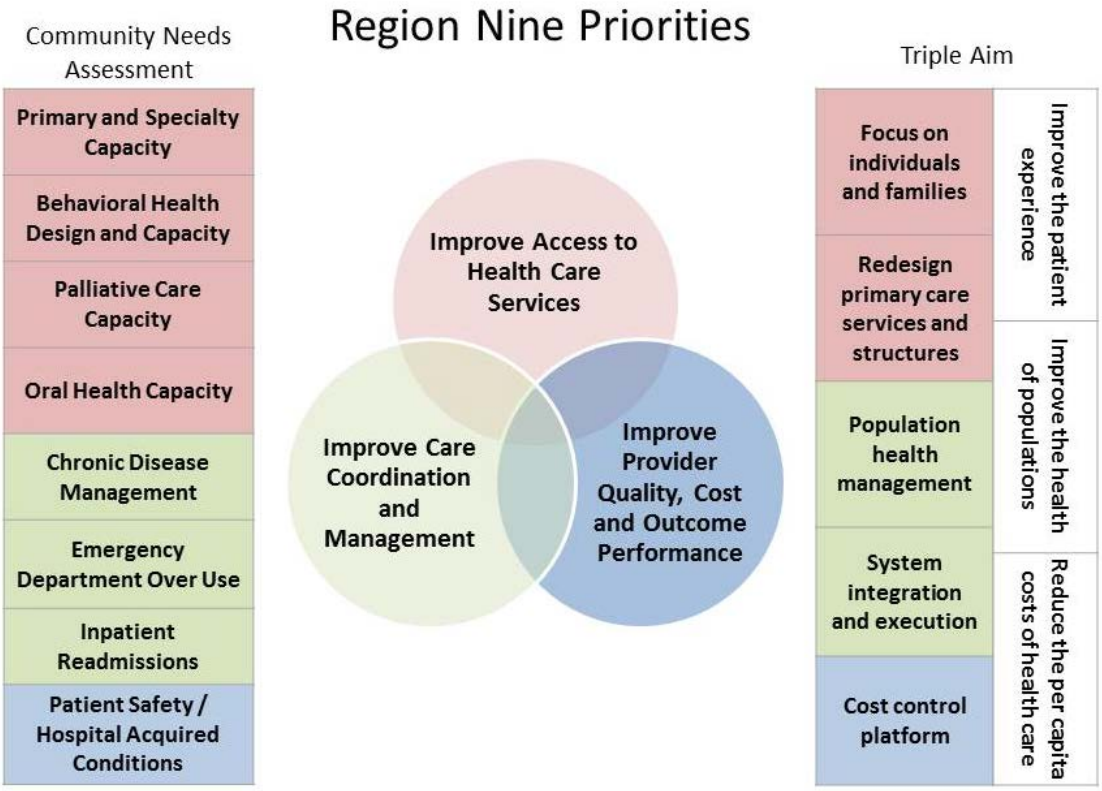
Under the direction of the Department of State Health Services, the NorthSTAR Program is a publicly funded managed care approach to the delivery of mental health and chemical dependency services to the eligible residents of Dallas, Ellis, Collin, Hunt, Navarro, Rockwall and Kaufman counties. The North Texas Behavioral Health Authority (NTBHA) serves as the local behavioral health (mental health and substance abuse) authority for the entire NorthSTAR service area and functions as the planning, oversight, and single portal authority. As presently structured, the NorthSTAR program is unable to serve as an IGT funding source for behavioral health programs. This has greatly limited the ability to have behavioral health DSRIP projects in Dallas County. Although unable to participate directly, the leaders of NorthSTAR and its behavioral health providers have been actively engaged in the plan development. Anticipating that NorthSTAR may be able to effect structural changes in its funding during the upcoming

[1] U.S. Census Bureau
[2] U.S. Census Bureau, American Fact Finder, Poverty Status in the Past Twelve Months, 2011

Texas legislative session, the RHP 9 participants have agreed to reserve funding allocation for NorthSTAR participation through a future plan modification.

RHP 9 Priorities

The following schematic presents the factors that frame the Region Nine focus for transformational change. Bracing on one side the challenges that were identified in the Community Needs Assessment and on the other side the intentions of the Texas Healthcare Transformation and Quality Improvement Program embodied by the Triple Aim, RHP 9 has identified three broad priorities for transformation. Each of the region's DSRIP projects addresses one or more of the priorities. Collectively, the projects that make up our plan will make significant strides in meeting the three priorities.



By designing and implementing projects that improve access to health care services, improve the coordination and management of care to the individual patient across the continuum, and improve the quality, cost and outcome performance of the region's health system providers, RHP 9 participants believe that we will address the community needs and advance the region with respect to the Triple Aim.

Key Challenges Facing the RHP

The size and density of the low-income population creates an enormous disparity between demand for and supply of services. This plan has a number of DSRIP projects that will contribute to the growth and development of healthcare service capacity. To maximize the impact of the projects that will grow capacity, the region must also obtain maximum utility from the projects designed for care coordination and care management interventions. Additionally, the plan development process used for the RHP 9 plan has has sparked a new and productive forum for collaboration and learning. RHP 9 will establish a robust post-implementation process to assure that the investment made in this plan will achieve maximal gains for the individual performing providers and for the region.

DSRIP Project Alignment with RHP 9 Priorities

The following graph presents the alignment of RHP 9 projects with the region's priority goals.

Summary of RHP 9 Projects Aligned with Plan Goals
Categories 1 and 2 Projects

See Appendix A for the detail that supports this graphic presentation.

While a little more than one third (34 percent) of the RHP 9 project investments relate to improving access to care, nearly half (46 percent) address assuring that the region's interventions are directed to coordinating the health system resources for the benefit of the individual patient. And 20 percent of the Region's project value is directed to strengthening the performance of the region's providers so that they can support and fulfill the region's goals.

Summary of Categories 1-2 Projects

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
Category 1: Infrastructure Development			
195018001.1.1 Establish more primary care clinics Baylor Medical Center Carrollton (Trinity Medical Center) 195018001	1.1.1 - Establish new clinic for underserved patients in the Carrollton area on the Baylor Carrollton campus.	IT- 1.7 Controlling high blood pressure (NQF 0018) (Stand-alone Measure) IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (wait times in clinic) IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (response time to patient phone calls) IT- 12.1 Breast Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.5 Other USPSTF-endorsed screening outcome measure (Non-standalone measure) - Influenza Vaccination Rate	$1,173,530
195018001.1.2 Expand Specialty Care Baylor Medical Center at Carrollton (Trinity Medical Center) 195018001	1.9.2 - Increase access to specialty care services in the Garland area	IT- 12.2 Cervical Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure) IT-11.1 Improvement in disparate health outcome for target population including identification of disparate gap	$244,485
121790303.1.1 Expand Primary Care Capacity Baylor Medical Center at Garland 121790303	1.1.2 - Expand current primary care capacity in the Garland area by opening provider panels to non-Baylor indigent/low income patients	IT- 1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)-Standalone Measure IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (wait	$1,753,656

121790303.1.2 Expand Specialty Care Capacity Baylor Medical Center at Garland 121790303	1.9.2 - Increase access to specialty care services in the Garland area	IT- 11.1 Improvement in Clinical Indicator in identified disparity group. (Standalone measure) -Improvement in Asthma IT- 12.2 Cervical Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)	$1,553,239
121776204.1.1 Expand Primary Care Capacity Baylor Medical Center at Irving 121776204	1.1.2 - Expand current primary care capacity in the Irving area by opening provider panels to non-Baylor indigent/low income patients	IT- 1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Stand-alone Measure) IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (wait times in clinic) IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (response time to patient phone calls) IT- 12.1 Breast Cancer Screening (HEDIS	$1,497,432

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
		2012) (Non-standalone measure) IT- 12.5 Other USPSTF-endorsed screening outcome measures (Non-standalone measure) - Influenza Vaccination Rate	
121776204.1.2 Expand Specialty Care Capacity Baylor Medical Center at Irving 121776204	1.9.2. - Increase access to specialty care services in the Garland area	IT- 11.1 Improvement in Clinical Indicator in identified disparity group. (Standalone measure) - Improvement in Asthma IT- 12.2 Cervical Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)	$1,228,661
139485012.1.1 Expand primary care capacity Baylor University Medical Center 139485012	1.1.2 - Expand current primary care capacity by opening provider panels to non-Baylor indigent/low income patients	IT- 1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)- Standalone Measure IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (wait times in clinic) IT- 6.1 Percent improvement over baseline of patient satisfaction scores: (Standalone Measure) timely care, appointments, and information (response time to patient phone calls) IT- 12.1 Breast Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.5 Other USPSTF-endorsed screening outcome measures (Non-standalone measure) - Influenza Vaccination Rate	$8,414,068

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
139485012.1.2 Expand Specialty Care Capacity Baylor University Medical Center 139485012	1.9.2 - Increase access to specialty care services	11.1 Improvement in Clinical Indicator in identified disparity group. (Standalone measure) - Improvement in Asthma IT- 12.2 Cervical Cancer Screening (HEDIS 2012) (Non-standalone measure) IT- 12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)	$7,281,405
138910807.1.1 Expand Primary Care Capacity Children's Medical Center of Dallas 138910807	1.1.1 - Expand capacity of pediatric primary care in Dallas County by opening 7 clinics that provide medical homes for children w/complex chronic illness	IT-9.2 ED Appropriate Utilization	$13,058,942
138910807.1.2 Expand Primary Care Capacity Children's Medical Center of Dallas 138910807	1.1.2 - Expand pediatric primary care capacity in Dallas County by expanding clinic hours and staffing	IT-9.2 ED Appropriate Utilization	$12,054,408
138910807.1.3 Implement Chronic Disease Management Registry Children's Medical Center of Dallas 138910807	1.3.1 - Expand CMC-certified disease management programs capacity to treat more patients and to provide infrastructure needed to accomplish standardized chronic illness management	IT-2.13 Other Readmission Rate	$12,054,408

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
138910807.1.4 Enhance service availability to appropriate levels of behavioral health Children's Medical Center of Dallas 138910807	1.12.2 - Expand pediatric behavioral health capacity in CMC primary care settings to align and coordinate care for behavioral and medical illnesses	IT-1.20 Other Outcome Measure	$12,054,408
121758005.1.1 Develop behavioral health crisis stabilization services Dallas County Health and Human Services 121758005	1.13.1 - Establish a community-based behavioral Health crisis stabilization program in Dallas County	IT-9.1 Decrease in Mental Health Admissions and Readmissions to Criminal Justice Settings IT-9.2 ED Appropriate Utilization (Stand-alone Measure	$17,642,792
137252607.1.1 Workforce Enhancement to improve behavioral health access Dallas County MHMR Center d/b/a Metrocare Services 137252607	1.14.2 – Increase number of behavioral health residents and others trained in a community mental health setting to reduce shortage of behavioral health providers	IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a Stand-alone Measure)	$1,595,363
137252607.1.2 – Pass 2 Expand Behavioral Health Outpatient Services for Children, Adults and Families Dallas County MHMR Center d/b/a Metrocare Services 137252607	1.12.2 - Expand number of community-based settings in underserved areas were behavioral health services may be delivered	IT-10.1 Quality of Life/Functional Status	$6,812,396
121988304.1.1 Develop behavioral health crisis stabilization services Lakes Regional MHMR Center 121988304	1.13.1 - Develop community-based behavioral health crisis stabilization services	IT-6.1 Percent Improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a Stand-alone Measure)	$6,421,691

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
121988304.1.2 Introduce Telemedicine/ Telehealth – Beh. Health Lakes Regional MHMR Center 121988304	1.7.1 - Implement telehealth behavioral health care service for low income patients in rural areas in/around Kaufman County	IT-6.1 Percent Improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a Stand-alone Measure)	$1,791,134
020943901.1.1 Expand, Telemedicine/ Telehealth – Stroke Medical City Dallas Hospital 020943901	1.7.1 - Align regional hospitals that form a stroke care system whereby facilities gain immediate access to vascular neurologists via telehealth network	IT-4.10 Treatment Rate Ischemic Stroke (IV t-PA/endovascular intervention) IT-4.10 Other - Average Length of Stay - Ischemic Stroke patients IT-4.10 Other - Door To Needle time for IV t-PA administration	$5,174,491
020943901.1.2 Introduce, Expand, Enhance Telemedicine/Telehealth – Behavioral Health Medical City Dallas Hospital 020943901	1.7.1 - Implement telemedicine program with psychiatric specialists at Green Oaks Hospital for consult, evaluation and treatment of patients at remote sites/hospitals	IT-2.4 Behavioral Health/Substance Abuse (BH/SA) Admission Rate (Stand-alone Measure)	$3,606,157
020943901.1.3 Expand Primary Care Capacity Medical City Dallas Hospital 020943901	1.1.1 - Partner with PediPlace (nonprofit organization) to establish a pediatric primary care outpatient clinic for Medicaid/ CHIP and uninsured patients in North Dallas	IT-9.3 Pediatric/Young Adult Asthma Emergency Room Visits (NQF 1381) (Stand-alone Measure)	$3,521,529
127295703.1.1 Establish more primary care clinics – Grand Prairie Parkland Health & Hospital System 127295703	1.1.2 - Expand primary care capacity for low income/indigent patients by ramping up new Community Oriented Primary Care clinic in Grand Prairie area in Dallas County	IT-1.2 Annual monitoring of patients on persistent medications – angiotensin converting enzyme (ACE inhibitors) or angiotensin receptor blockers (ARBs) (Non-standalone Measure) IT-1.12 Diabetes: Retinal Eye Exam (NQF 0055) (Non-standalone Measure)	$29,017,613

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
		IT-1.20 Other: % patients who by age 13 were up-to-date with recommended adolescent immunizations: MCVS, Tdap	
127295703.1.2 Expand current primary care capacity Parkland Health & Hospital System 127295703	1.1.2 - Expand primary care capacity for low income/indigent patients throughout the Parkland network of primary care sites through various methods including expanding hours, staff and space	IT-1.2 Annual monitoring of patients on persistent medications (NCQA-HEDIS 2012) – angiotensin converting enzyme (ACE inhibitors) or angiotensin receptor blockers (ARBs) (Non-standalone Measure) IT-1.12 Diabetes: Retinal Eye Exam (NQF 0055) (Non-standalone Measure) IT-1.20 Other: % patients who by age 13 were up-to-date with recommended adolescent immunizations: MCVS, Tdap	$20,598,923
127295703.1.3 Implement chronic care disease registry Parkland Health & Hospital System 127295703	1.3.1 - Implement a chronic disease management registry to assist with implementation of a chronic care/disease management model	IT-1.2 Annual monitoring of patients on persistent medications (NCQA-HEDIS 2012) – angiotensin converting enzyme (ACE inhibitors) or angiotensin receptor blockers (ARBs) (Non-standalone Measure) IT-1.12 Diabetes: Retinal Eye Exam (NQF 0055) (Non-standalone Measure) IT-3.3 Diabetes 30-Day Readmission Rate (Stand-alone Measure)	$27,405,524
127295703.1.4 Enhance performance improvement and reporting capacity Parkland Health & Hospital System 127295703	1.10.4 – Implement the Quality Through Transformation Initiative	IT-9.2 ED Appropriate Utilization	$30,808,824

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
127295703.1.5 Expand specialty care capacity Parkland Health & Hospital System 127295703	1.9.2 – Expand specialty care access	IT-1.1 Third next available appointment IT-9.2 ED Appropriate Utilization	$23,285,739
127295703.1.6 – Pass 2 Establish more primary care clinics – Acute Response Clinic(s) Parkland Health & Hospital System 127295703.6	1.1.1 – Develop Acute Response Clinic	IT-3.1 All Cause 30-day Readmission Rate	$29,375,855
127295703.1.7 – Pass 2 Enhance Interpretation Services Parkland Health & Hospital System 127295703	1.4.7 – Other: Implement Health Literate Care Model and Enhance Interpretation Services	IT-6.1 Percent improvement over baseline for patient satisfaction scores	$26,689,039
009784201.1.1 Expansion of Senior Dental Student Externship Program Texas A&M Health Science Center / Baylor College of Dentistry 009784201	1.8.1 - Develop academic linkages with three Texas dental schools to establish a multi-week externship program for fourth year dental students	IT-7.10 Other Outcome Improvement Target: Percentage of class participating in externship program	$2,657,811
009784201.1.2 Expansion of Dallas County dental clinics Texas A&M Health Science Center / Baylor College of Dentistry 009784201	1.8.6 – Expansion of services - dental clinic hours	IT-7.1 Dental Sealant: Percentage of children age 6-9 with a dental sealant on permanent first molar tooth. IT-7.3 Early Childhood Caries (fluoride applications): Percentage of children age 0-6 who received a fluoride varnish application during the measurement period	$10,502,323

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
		IT-7.4 Topical Fluoride Application: Percentage of children 0-20 years who received a fluoride varnish application during the measurement period	
009784201.1.3 Expansion of school-based dental sealant program Texas A&M Health Science Center / Baylor College of Dentistry 009784201	1.8.9 – Expand school-based sealant and/or fluoride varnish programs	IT-7.1 Dental Sealant: Percentage of children age 6-9 with a dental sealant on permanent first molar tooth. IT-7.3 Early Childhood Caries (fluoride applications): Percentage of children age 0-6 who received a fluoride varnish application during the measurement period IT-7.4 Topical Fluoride Application: Percentage of children 0-20 years who received a fluoride varnish application during the measurement period	$2,722,572
020908201.1.1 Expand existing primary care capacity Texas Health Presbyterian Hospital Dallas 020908201	1.1.2 - The Continuing Care Clinic will be located in ED fast track area to provide an alternative lower level of care setting for urgent needs	IT-3.3 Diabetes 30-Day Readmission rate (Stand-alone measure) IT-3.10 Adult Asthma 30-Day Readmission Rate (Standalone measure) IT-9.2 ED Appropriate Utilization (Stand-alone measure)	$5,494,653
126686802.1.1 Establish more primary care clinics UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.1.1 - Establish primary care clinic co-located with specialty care clinic	IT-12.1 Breast Cancer Screening (Non-standalone Measure) IT-12.3 Colorectal Cancer Screening (Non-standalone Measure) IT-12.4 Pneumonia vaccination status of older adults (Non-standalone Measure)	$8,821,395

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
126686802.1.2 Expand Primary Care Capacity UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.1.2 - Expand primary care capacity within the UTSCAP network	IT-12.1 Breast Cancer Screening (Non-standalone Measure) IT-12.3 Colorectal Cancer Screening (NSA) IT-12.4 Pneumonia vaccination status of older adults (Non-standalone Measure)	$14,996,373
126686802.1.3 Expand Primary Care Capacity UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.1.4 - Implement quality incentive program for primary care providers	IT-12.1 Breast Cancer Screening (Non-standalone Measure) IT-12.3 Colorectal Cancer Screening (Non-standalone Measure) IT-12.4 Pneumonia vaccination status of older adults (Non-standalone Measure)	$17,201,722
126686802.1.4 Introduce, Expand, or Enhance Telemedicine/Telehealth UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.7.1 - Introduce telehealth network	IT-1.6 Cholesterol Management for patients with cardiovascular conditions (NCQA-HEDIS 2012) (Stand-alone Measure) IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (SA) IT-1.10 Diabetes care: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone Measure)	$15,878,512
126686802.1.5 Expand Specialty Care Capacity UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.9.2 - Establish specialty care clinic co-located with primary care	IT-1.6 Cholesterol Management for patients with cardiovascular conditions (NCQA-HEDIS 2012) (Stand-alone Measure) IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Stand-alone Measure)	$10,144,606

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
126686802.1.6 Enhance Performance Improvement and Reporting Capacity UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.10.2 – Enhance improvement capacity through technology	IT-12.1 Breast Cancer Screening (Non-standalone Measure) IT-12.3 Colorectal Cancer Screening (Non-standalone Measure IT-12.4 Pneumonia vaccination status of older adults (Non-standalone Measure) IT-1.10 Diabetes Care: HbA1c poor control	$11,908,885
126686802.1.7 – Pass 2 Increase training of Primary Care Workforce UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.2.1 - Increase training of primary care workforce	IT-1.20 Number of primary care practitioners in HPSAs or MUAs who report they plan to implement chronic disease management	$7,467,369
126686802.1.8 – Pass 2 Increase Training of Primary Care Workforce UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.2.1 - Inrease training of Family Medicine residents in Patient-Centered Medical Home and Chronic Disease Management	IT-14.1 Number of practicing primary care practitioners per 1000 individuals in HPSAs or MUAs	$4,910,295
126686802.1.9 – Pass 2 Expansion and Redesign of UTSW Physician Assistant Program UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.2.2 - Expansion and Redesign of UTSW Physician Assistant Program	IT-14.2 Number of practicing nurse practioners and physician assistants per 1,000 individuals in HPSAs or MUAs	$9,239,332

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
126686802.1.10 – Pass 2 Training of Community Health Workers UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.2.2 - Training of Community Health Workers	IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Stand-alone Measure)	$7,360,599
126686802.1.11 – Pass 2 Establish and Expand Urgent Care Services for Cancer Patients UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.9.2 - Establish and expand urgent care services for cancer patients	IT-2.13 Other Admission Rate (complications of cancer treatment) IT-9.2 ED Appropriate Utilization	$10,918,064
126686802.1.12 – Pass 2 Enhance Performance Improvement and Reporting Capacity UT Southwestern Medical Center – Faculty Practice Plan 126686802	1.10.2 – Enhance Performance Improvement and Reporting Capacity through development of quality data management and systems engineering group/function	IT-3.1 All Cause 30-day Readmission Rate	$10,881,242
175287501.1.1 – Pass 2 Expand specialty care capacity UT Southwestern Medical Center - St. Paul University Hospital 175287501	1.9.3 - Expand specialty care capacity by providing access to bone marrow and solid organ transplants for patients with inadequate funding	IT-1.20 Other outcomes improvement target. Outcomes of bone marrow and solid organ transplantation IT-4.2 Central Line-Associated Bloodstream (CLABSI) Rate	$11,749,722

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
Category 2: Program Innovation and Redesign			
195018001.2.1 Expand Chronic Care Management Models Baylor Medical Center at Carrollton (Trinity Medical Center) 195018001	2.2.2 - Establish chronic care management program to provide focused and dedicated education and care for patients with diabetes, cardiovascular, and respiratory disease w/in primary care setting	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone measure) IT-1.11 Diabetes: BP control (<140/ 80mm Hg) (NQF 0061) (Stand-alone measure) IT-1.13 Diabetes: Foot exam (NQF 0056) (Non-standalone measure)	$447,059
121790303.2.1 Expand Chronic Care Management Model - Create Chronic Disease management and Prevention Program Baylor Medical Center at Garland 121790303	2.2.2 - Establish a chronic care management program to provide education and care for patients w/ diabetes, cardiovascular disease and respiratory disease within a primary care setting	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Standalone measure) IT-1.11 Diabetes: BP control (<140/ 80mm Hg) (NQF 0061) (Standalone measure) IT-1.13 Diabetes: Foot exam (NQF 0056) (Non- standalone measure)	$1,628,396
121790303.2.2 Develop Care Management Function that integrates primary and behavioral health needs of individuals Baylor Medical Center at Garland 121790303	2.19.1 - Co-locate and integrate behavioral health into the primary care setting at Baylor Medical Center at Garland	IT-11.1 Improvement in Clinical Indicator in identified disparity group.(Standalone measure) - Improvement in Diabetes IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Non-standalone measure) - Improve behavioral health treatment rates	$1,553,239

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
121790303.2.3 Establish/Expand a Patient Care Navigation Program Baylor Medical Center at Garland 121790303	2.9.1 - Create a fluid patient navigation program located at Baylor Medical Center of Garland ER for patients identified as not having a primary care physician and/or a medical home	IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Standalone measure for Project 2.5 only) IT-9.2 ED appropriate utilization (Standalone measure)	$1,540,714
121790303.2.4 – Pass 2 Pilot intervention(s) in Care Transitions – Home Visit Program Baylor Medical Center at Garland 121790303	2.12.2 - Pilot intervention(s) in Care Transitions targeting defined patient population – early followup – Vulnerable Patient Network (Home Visit Program)	IT-10.1 Quality of Life (Standalone Measure) IT-10.2: Activities of Daily Living (Standalone Measure)	$1,029,021
121790303.2.5 – Pass 2 Other: Medication Management and Prescription Assistance Program Baylor Medical Center at Garland 121790303	2.11.3 - Evidence-based interventions - teams, techonology and processes - to to insure medication compliance and management	IT-1.2 Annual monitoring of patients on persistent medications – ACE inhibitors/ ARBSs (Non-standalone Measure) IT-1.4 Annual monitoring of patients on persistent medications – diuretics (Non-standalone Measure) IT-1.5 Annual monitoring of patients on persistent medications – anticonvulsants (Non-standalone Measure) IT-1.19 Anti-depressant Medication Management (Standalone Measure)	$912,528
121776204.2.1 Expand Chronic Care Management Models Baylor Medical Center at Irving 121776204	2.2.2 - Establish chronic care management program in primary care setting to provide education and care for patients w/ diabetes, cardiovascular disease and respiratory disease	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Standalone measure) IT-1.11 Diabetes: BP control (<140/ 80mm Hg) (NQF 0061) (Standalone measure)	$1,267,057

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
		IT-1.13 Diabetes: Foot exam(NQF 0056) (Non- standalone measure)	
121776204.2.2 Develop a Care Management function that integrates primary and behavioral health needs of individuals Baylor Medical Center at Irving 121776204	2.19.1 - Co-locate and integrate behavioral health into the primary care setting at Baylor Medical Center of Irving	IT-11.1 Improvement in Clinical Indicator in identified disparity group. (Standalone measure) - Improvement in Diabetes IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Non-standalone measure) - Improvement in behavioral health treatment rates	$1,087,877
121776204.2.3 Establish/Expand a Patient Care Navigation Program Baylor Medical Center at Irving 121776204	2.9.1 - Create a fluid patient navigation program in ER for patients identified as not having a primary care physician and/or a medical home	IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Non- standalone measure) IT-9.2 ED appropriate utilization (Standalone measure)	$1,087,877
121776204.2.4 – Pass 2 Pilot intervention in Care Transitions - Home Visits Baylor Medical Center at Irving 121776204	2.12.2 - Pilot in Care Transitions targeting defined population – early followup – Vulnerable Patient Network (Home Visit Program)	IT-10.1 Quality of Life (Standalone Measure) IT-10.2: Activities of Daily Living (Standalone Measure)	$1,024,269
121776204.2.5 – Pass 2 Other: Medication Management and Prescription Assistance Program Baylor Medical Center at Irving 121776204	2.11.3 - Evidence-based interventions - teams, techonology and processes - to to insure medication compliance and management	IT-1.2 Annual monitoring of patients on persistent medications – ACE inhibitors/ ARBSs (Non-standalone Measure) IT-1.4 Annual monitoring of patients on persistent medications – diuretics (Non-standalone Measure)	$908,313

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
		IT-1.5 Annual monitoring of patients on persistent medications – anti-convulsants (Non-standalone Measure) IT-1.19 Anti-depressant Medication Management (Standalone Measure)	
139485012.2.1 Expand Chronic Care Management Models Baylor University Medical Center 139485012	2.2.2 - Establish a chronic care management program to provide focused and dedicated education and care for patients with diabetes, cardiovascular or respiratory disease in primary care setting	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Standalone measure) IT-1.11 Diabetes: BP control (<140/80mm Hg) (NQF 0061) (Standalone measure) IT-1.13 Diabetes: Foot exam (NQF 0056) (Non- standalone measure)	$7,658,960
139485012.2.2 Develop Care Management Function that integrates primary and behavioral health needs of individuals Baylor University Medical Center 139485012	2.19.1 - Co-locate and integrate behavioral health into the primary care setting – provide services including behavioral health counseling, screening, treatment	IT-11.1 Improvement in Clinical Indicator in identified disparity group. (Standalone measure) - Improvement in Diabetes IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (NSA) – Improvement in behavioral health treatment rates	$7,497,150
139485012.2.3 Establish/Expand a Patient Care Navigation Program Baylor University Medical Center 139485012	2.9.1 - Expand patient navigation program (Care Connect) for patients identified as not having a primary care physician and/or a medical home	IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Non- standalone measure) IT-9.2 ED Appropriate Utilization (Standalone measure)	$7,281,405

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
139485012.2.4 – Pass 2 Pilot intervention(s) in Care Transitions – Home Visit Program Baylor University Medical Center 139485012	2.12.2 - Pilot intervention(s) in Care Transitions targeting defined patient population – early followup – Vulnerable Patient Network (Home Visit Program)	IT-10.1 Quality of Life (Standalone Measure) IT-10.2: Activities of Daily Living (Standalone Measure)	$4,602,388
139485012.2.5 – Pass 2 Other: Medication Management and Prescription Assistance Program Baylor University Medical Center 139485012	2.11.3 - Evidence-based interventions - teams, techonology and processes - to to insure medication compliance and management	IT-1.2 Annual monitoring of patients on persistent medications – ACE inhibitors/ ARBSs (Non-standalone Measure) IT-1.4 Annual monitoring of patients on persistent medications – diuretics (Non-standalone Measure) IT-1.5 Annual monitoring of patients on persistent medications – anticonvulsants (Non-standalone Measure) IT-1.19 Anti-depressant Medication Management (Standalone Measure)	$4,081,362
138910807.2.1 Enhance/Expand Medical Homes Children's Medical Center of Dallas 138910807	2.1.1 - Develop, implement and spread across Children's Medical Center pediatric primary care centers a medical home team-based approach to care	IT-9.2 ED Appropriate Utilization	$15,068,009
138910807.2.2 Implement Evidence-based Health Promotion Program Children's Medical Center of Dallas 138910807	2.6.1 - Integrate fragmented individual community health improvement activities into organized set of evidence-based interventions for conditions such as asthma and diabetes	IT-9.3 Pediaric and Young Adult Asthma Emergency Visits	$13,058,941

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
138910807.2.3 Establish/Expand a Patient Care Navigation Program Children's Medical Center of Dallas 138910807	2.9.1 - Utilize high-intensity, culturally appropriate care management system for Medicaid and safety net children and families	IT-9.2 ED Appropriate Utilization	$13,058,942
138910807.2.4 Implement/Expand Care Transitions Programs Children's Medical Center of Dallas 138910807	2.12.2 - Develop standardized approach to transition adolescents with special health needs or at risk for loss of medical services;	IT-9.2 ED Appropriate Utilization	$10,033,464
121758005.2.1 Disease Outbreaks and Sentinel Events Health Education Dallas County Health and Human Services 121758005	2.6.2 Establish self-management programs and wellness using evidence-based designs	IT-11.2 Improvement in disparate health outcomes for target population, including identification of the disparity gap (NSA) IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity (NSA) IT-12.5 Other USPSTF-endorsed screening outcome measure	$623,230
121758005.2.2 STD, TB, Immunizations - Health Education Dallas County Health and Human Services 121758005	2.6.2 Establish self-management programs and wellness using evidence-based designs	IT-11.2 Improvement in disparate health outcomes for target population, including identification of the disparity gap (NSA) IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity (NSA) IT-12.5 Other USPSTF-endorsed screening outcome measure	$1,548,089

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
137252607.2.1 Integrate Primary and Behavioral Health Services Dallas County MHMR Center d/b/a Metrocare Services 137252607	2.15.1 - Provide integrated model of open access to primary care services for mental health patients.	IT-1.7 Controlling high blood pressure	$4,317,743
137252607.2.2 Intervention for a targeted behavioral health population to prevent unnecessary use of services – ACT Dallas County MHMR Center d/b/a Metrocare Services 137252607	2.13.1 – Utilize Behavior Treatment Services Assertive Community Wrap-around Treatment Team (ACT) to be on-call to travel to an acute care facility, jail or school to assess and stabilize situation and provide follow up behavioral health services as appropriate	IT-10.1 Quality of Life	$1,291,504
137252607.2.3 Intervention for a behavioral health population to prevent unnecessary use of services – Family Preservation Dallas County MHMR Center d/b/a Metrocare Services 137252607	2.13.1 - Establish Family Preservation Program - short-term intensive program for medication management, case management and counseling to young patients discharged from psychiatric facilities and/or those at risk for out-of-home placement	IT-10.1 Quality of Life	$2,702,056

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
137252607.2.4 Intervention for targeted behavioral health population to prevent unnecessary use of services – Center for Children with Autism Dallas County MHMR Center d/b/a Metrocare Services 137252607	2.13.1 - The Center for Children with Autism will provide 1:1 applied behavior analysis to children with on the autism spectrum and/or children with other developmental disabilities	IT-9.4 Other Outcome Improvement Target – Reduce intensive school services and out-of-home treatment Episodes IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions of survey must be answered to be stand-alone measure)	$2,838,600
137252607.2.5 Intervention for a targeted behavioral health population to prevent unnecessary use of services– Day Program Dallas County MHMR Center d/b/a Metrocare Services 137252607	2.13.1 - The Behavioral Health Day Program will provide short-term behavioral intervention, crisis diversion and urgent safety net services for individuals with intellectual and developmental disabilities	IT-10.1 Quality of Life	$2,968,053
136360803.2.1 Expand Chronic Care Management Models Denton County Health and Human Services 136360803	2.2.1 - Establish team-based chronic management approach, incorporating components of the Wagner Chronic Care Model. Develop/utilize a diabetes registry (Denton County)	IT-1.10 Diabetes: HbA1c poor control > 9.0% (NQF 0059) (Stand-alone Measure)	$4,410,698
136360803.2.2 Implement Evidence-based Disease Prevention Programs Denton County Health and Human Services 136360803	2.7.6 - Target low income Denton County Health Clinic adult patients to receive vaccines to help them stay healthy, stay on the job, and prevent disease, hospitalization	IT-2.10 Flu and Pneumonia Admissions Rate (Stand-alone Measure)	$4,410,698

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
135234606.2.1 Process Improvement Methodology Denton County MHMR Center 135234606	2.8.6 - Establish 24-hour psychiatric triage facility to better accommodate high demand for psychiatric triage services, and to reduce inappropriate ED utilization	IT-9.2 ED Appropriate Utilization (Stand-alone Measure)	$11,090,221
135234606.2.2 Integrate Primary and Behavioral Health Care Services Denton County MHMR Center 135234606	2.15.1 - Integrate care management functions for individuals with co-morbid chronic diseases, mental illness, and/or substance use disorders, through collaborative partnership agreements	IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a stand-alone measure)	$5,238,202
135234606.2.3 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in specified setting Denton County MHMR Center 135234606	2.13.1 - Increase capacity for crisis residential services to better accommodate the high demand for crisis residential services and reduce potentially preventable admissions and readmissions to hospitals and jails	IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a stand-alone measure)	$8,710,400
111905902.2.1 Process Improvement Methodology to Improve Quality and Efficiency – Sepsis Denton Regional Medical Center 111905902	2.8.11 - Design and implement a Process Improvement plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles and improve outcomes	IT-4.8 Sepsis mortality (Stand-alone Measure) IT-4.9 Average length of stay (Non-standalone Measure)	$1,370,117

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
111905902.2.2 Redesign to Improve Patient Experience Denton Regional Medical Center 111905902	2.4.1 - Establish baseline HCAHPS scores and implement patient/ family experience strategic plan	IT-6.1 Percent improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a stand-alone measure)	$1,934,127
094194002.2.1 – Pass 2 Enhance/Expand Medical Home Model – Mission East Dallas Doctors Hospital at White Rock Lake (Tenet) 094194002	2.1.2 – Collaborate with an affiliated Patient-Centered Medical Home to integrate care management and coordination for shared, high-risk patients	IT-12.2 Cervical cancer screening IT-1.10 Diabetes Care: HbA1c poor control (<9.0%)	$2,555,600
094194002.2.2 – Pass 2 Implement/Expand Care Transitions Program Doctors Hospital at White Rock Lake (Tenet) 094194002	2.12.1-Implement care transitions program targeting patients with highest risk of readmissions	IT-1.10 Diabetes Care: HbA1c poor control (<9.0%)	$613,900
121988304.2.1 – Pass 2 Intervention for targeted behavioral health population to prevent unnecessary use of services in specified setting Lakes Regional MHMR Center 121988304	2.13.1 - Design, implement and evaluate research-supported and evidence-based interventions tailored towards target population – Lakes Regional Cognitive Enhancement Therapy	IT-6.1 Patient Satisfaction	$3,490,488

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
020979301.2.1 Redesign to Improve Patient Experience Las Colinas Medical Center 020979301	2.4.1 - Establish baseline HCAHPS scores and implement patient/ family experience strategic plan	IT-6.1 Percent Improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a stand-alone measure)	$657,118
094192402.2.1 Redesign to Improve Patient Experience Medical Center of Lewisville 094192402	2.4.1 - Establish baseline HCAHPS scores and implement patient/ family experience strategic plan	IT-6.1 Percent Improvement over baseline of patient satisfaction scores (all questions on survey must be answered to be a stand-alone measure)	$849,981
094192402.2.2 Process Improvement Methodology to Improve Quality and Efficiency – Sepsis Medical Center of Lewisville 094192402	2.8.11 - Design and implement a Process Improvement plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles and improve patient outcomes	IT-4.8 Sepsis mortality (Stand-alone Measure) IT-4.9 Average length of stay (Non-standalone Measure)	$1,923,053
094192402.2.3 Establish/Expand a Patient Care Navigation Program Medical Center of Lewisville 094192402	2.9.1 - Implement patient care navigation program (patient assessment, case management, health literacy/ education, psychosocial support, and self-management education and support	IT-9.2 ED appropriate utilization (Stand-alone Measure)	$751,402
020943901.2.1 Integrate Primary and Behavioral Health Services Medical City Dallas Hospital 020943901	2.15.1 - Partner with Green Oaks Hospital to establish integrated primary and behavioral health clinic for patients receiving OP psychiatric care	IT-2.4 Behavioral Health/Substance Abuse Admission Rate IT-3.8 Behavioral Health/Substance Abuse 30-Day Readmission Rate	$3,901,150

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
020943901.2.2 Project Withdrawn Medical City Dallas Hospital 020943901	Project Withdrawn	Project Withdrawn	$0
020943901.2.3 Process Improvement Methodology to Improve Quality and Efficiency – Sepsis Medical City Dallas Hospital 020943901	2.8.11 - Implement Process Improvement plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles and improve patient outcomes	IT-4.8 Sepsis Mortality (Stand-alone Measure) IT-4.9 Average Length of Stay (Non-standalone Measure)	$3,753,964
020943901.2.4 – Pass 2 Enhance/Expand Medical Home Model at Metrocrest Clinic Medical City Dallas Hospital 020943901	2.1.1 - Establish a Medical Home at Metrocrest Clinic	IT-11.5 All Cause 30-day Readmission Rate	$3,007,899
126679303.2.1 Expand Chronic Disease Management Model Methodist Charlton Medical Center 126679303	2.2.2 - Apply evidence-based care management models for patients identified as having high-risk health care needs associated with diabetes	IT-1.11 Diabetes Control: Blood pressure control (<140/80mm Hg) IT-1.10 Diabetes Care: HbA1c poor control (>9.0%) (Stand-alone Measure) IT-3.3 Diabetes 30-day Readmission Rate (Stand-alone Measure)	$4,645,535
126679303.2.2 Expand patient care navigation program Methodist Charlton Medical Center 126679303	2.9.1 - Establish patient navigation services in the ED for high-risk patients or those identified as not having a primary care physician and/or medical home	IT-9.2 ED Utilization (Stand-alone Measure) IT-3.1 All cause 30-Day Readmission Rate (Stand-alone Measure)	$8,627,425

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
135032405.2.1 Expand patient care navigation program Methodist Dallas Medical Center 135032405	2.9.1 - Establish patient navigation services in the ED for high-risk patients or those identified as not having a primary care physician and/or medical home	IT-3.1 All cause 30-Day Readmission Rate (Stand-alone Measure) IT-9.2 ED Utilization (Stand-alone Measure)	$14,383,398
135032405.2.2 Expand Chronic Disease Management Model Methodist Dallas Medical Center 135032405	2.2.2 - Apply evidence-based care management models for patients identified as having high-risk health care needs	IT-1.10 Diabetes Care: HbA1c poor control (>9.0%) (Stand-alone Measure) IT-1.11 Diabetes Control: Blood pressure control (<140/80mm Hg) IT-3.3 Diabetes 30-day Readmission Rate (Stand-alone Measure)	$7,321,539
135032405.2.3 – Pass 2 Enhance/ Expand Medical Home Model Methodist Dallas Medical Center 135032405	2.1.1 - Enhance/Expand Medical Home through charitable clinics	IT-11.5 All Cause 30-day Readmission Rate	$2,695,406
209345201.2.1 Expand patient care navigation program Methodist Richardson Medical Center 209345201	2.9.1 - Establish patient navigation services in the ED for high-risk patients or those identified as not having a primary care physician and/or medical home	IT-3.1 All cause 30-Day Readmission Rate (Stand-alone Measure) IT-9.2 ED Utilization (Stand-alone Measure)	$3,082,751
209345201.2.2 Expand Chronic Disease Management Model Methodist Richardson Medical Center 209345201	2.2.1 - Apply evidence-based care management models for patients identified as having high-risk health care needs associated with diabetes	IT-1.10 Diabetes Care: HbA1c poor control (>9.0%) (Stand-alone Measure) IT-1.11 Diabetes Control: Blood pressure control (<140/80mm Hg) IT-3.3 Diabetes 30-day Readmission Rate (Stand-alone Measure)	$2,055,166

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
127295703.2.1 Expand Medical Home Model Parkland Health & Hospital System 127295703	2.1.1. - Expand the medical home model through PCMH recertification for the COPC primary care clinics	IT-1.2 Annual monitoring of patients on persistent medications – ACE inhibitors/ ARBs (Non-standalone Measure) IT-1.12 Diabetes: Retinal Eye Exam (NQF 0055) (Non-standalone Measure) IT-1.20 Other: % patients who by age 13 were up-to-date with recommended adolescent immunizations: MCVS, Tdap	$23,643,981
127295703.2.2 Project Withdrawn Parkland Health & Hospital System 127295703	Project Withdrawn	Project Withdrawn	$0
127295703.2.3 Project Withdrawn Parkland Health & Hospital System 127295703	Project Withdrawn	Project Withdrawn	$0
127295703.2.4 Expand chronic care model Parkland Health & Hospital System 127295703	2.2.1 - Implement a chronic care model that reflects the evidence-based Wagner Chronic Care Model in COPC primary care clinics	IT-1.2 Annual monitoring of patient on persistent meds - ACE inhibitors/ ARBS (Non-standalone Measure) IT-1.12 Diabetes: Retinal Eye Exam (NQF 0055) (Non-standalone Measure) IT-3.3 Diabetes 30-Day Readmission Rate (Stand-alone Measure)	$31,167,066
127295703.2.5 Assess cost effectiveness of post-acute care alternatives Parkland Health & Hospital System 127295703	2.5.2 - Produce methodology using well developed cost-effectiveness data to evaluate expansions, contractions or changes of the care continuum with objective of providing integrated, patient-centered, cost effective care	IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Stand-alone) IT-5.2 Per episode cost of care (Stand-alone Meaure)	$29,375,855

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
127295703.2.6 Apply Process Improvement Methodology - PPCs Parkland Health & Hospital System 127295703	2.8.5 - Implement interventions to reduce potentially preventable complications (PPCs)	IT-4.2 CLABSI Rates (Stand-alone Measure) IT-4.3 CAUTI Rates (Stand-alone Measure) IT-4.4 SSI Rate (Stand-alone Measure) IT-4.8 Sepsis Mortality	$31,167,066
127295703.2.7 Enhance patient care navigation program Parkland Health & Hospital System 127295703	2.9.1 - Implement strategic redesign of Parkland's case coordination program including patient navigation program	IT-3.1 All Cause 30-Day Readmissions Rate – NQF 178935 (Stand-alone Measure)	$22,211,012
127295703.2.8 Implement palliative care program Parkland Health & Hospital System 127295703	2.10.1 - Execute a planning process to implement a palliative care program	IT-13.3 Proportion of patients with more than one ED visit in the last days of life (NQF 0211) – Percentage of patients who died from cancer with more than one emergency room visit in the last days of life (Stand-alone Measure)	$25,972,554
127295703.2.9 Implement care transitions program Parkland Health & Hospital System 127295703	2.12.1 - Redesign Parkland's care coordination program including highly functional care transitions / discharge process	IT-3.1 All Cause 30-Day Readmissions Rate – NQF 178935 (Stand-alone Measure)	$24,539,587

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
127295703.2.10 Increase Patient Satisfaction Parkland Health & Hospital System 127295703	2.4.3 – Increase patient satisfaction across through system-wide focus and efforts	IT-6.1 Percent improvement over baseline of patient satisfaction scores	$19,703,317
127295703.2.11 – Pass 2 Enhance/Expand Medical Home Model – Family Medicine Clinic Parkland Health & Hospital System 127295703	2.1.1 – Enhance/Expand Medical Home Model – Family Medicine Clinic	IT-1.1 Third next available appointment IT-1.12 Diabetes: Retinal Eye Exam IT-1.13 Diabetes: Foot Exam	$15,225,291
127295703.2.12 – Pass 2 Apply Process Improvement Methodology to Improve Quality/ Efficency – OPAT Program Parkland Health & Hospital System 127295703	2.8.4 – Apply Process Improvement Methodology to Improve Quality/ Efficency – Outpatient Parenteral Antimicrobial Therapy (OPAT) Program	IT-3.12 Other: All Cause 30-day Readmission Rate for Patients Enrolled in OPAT program	$25,972,554
020908201.2.1 Project Withdrawn Texas Health Presbyterian Hospital Dallas 020908201	Project Withdrawn	Project Withdrawn	$0
020908201.2.2 Implement Evidence-based Health Promotion Programs Texas Health Presbyterian Hospital Dallas 020908201	2.6.2 - Faith Community Health/Nursing program will partner with faith communities to design self-management wellness program.	IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Stand-alone Measure) IT-1.11 Diabetes: BP Control (< 140/ 90mm hg) (NQF 0061) (Stand-alone Measure)	$2,389,097

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
020908201.2.3 – Pass 2 Enhance Medical Home Model: Healing Hands Ministries Texas Health Presbyterian Hospital Dallas 020908201	2.1.2 – Collaborate with an affiliated Patient-Centered Medical Home to integrate care management and coordination for shared, high-risk patients	IT-11.5 All Cause Readmission Rate for Chronically Ill IT-5.1 Improved cost savings: demonstate cost savings in care delivery	$10,556,611
020967801.2.1 Expand patient care navigation program Texas Health Presbyterian Hospital Denton 020967801	2.9.1 - Implement ED-based nurse navigator program to assist with care coordination and avoid unnecessary ED visits or hospitalizations	IT-9.2 ED Appropriate Utilization (Stand-alone measure)	$2,796,366
020967801.2.2 Expand Chronic Care Management Models Texas Health Presbyterian Hospital Denton 020967801	2.2.1 - Develop diabetes management education program. A multi-disciplinary care team will coordinate treatment and provide self-management education and support	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone Measure)	$521,347
094140302.2.1 Expand patient care navigation program Texas Health Presbyterian Hospital Kaufman 094140302	2.9.1 - Implement ED-based nurse navigator program to assist with care coordination and avoid unnecessary ED visits or hospitalizations	IT-9.2 ED Appropriate Utilization (Stand-alone measure)	$2,242,406
094140302.2.2 Expand Chronic Care Management Models Texas Health Presbyterian Hospital Kaufman 094140302	2.2.1 - Develop program with multi-disciplinary care team that will develop care models, coordinate prescribed treatment, and provide self-management education to diabetic patients	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone Measure) IT-3.3 Diabetes 30-Day Readmission Rate (Stand-alone Measure)	$150,570

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
126686802.2.1 Expand Medical Homes UT Southwestern Medical Center – Faculty Practice Plan 126686802	2.1.1 - Expand the medical home model of care in the UTSCAP primary care network	IT-12.1 Breast Cancer Screening (Non-standalone Measure) IT-12.3 Colorectal Cancer Screening (NSA) IT-12.4 Pneumonia vaccination status of older adults (NSA)	$12,791,024
126686802.2.2 Expand an Existing, Successful Advanced Training Program in Quality Improvement Methodology UT Southwestern Medical Center – Faculty Practice Plan 126686802	2.8.1 – Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement	IT-1.10 Diabetes care: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone measure) IT-3.1 All Cause 30-Day Readmission Rate (Stand-alone Measure)	$7,057,117
126686802.2.3 Redesign for Cost Containment UT Southwestern Medical Center – Faculty Practice Plan 126686802	2.5.1 – Develop integrated care model with outcome-based payments	IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery	$7,454,080
126686802.2.4 Establish/Expand a Patient Care Navigation Program UT Southwestern Medical Center – Faculty Practice Plan 126686802	2.9.1 - Establish a patient care navigation program at the University hospitals	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone Measure) IT-3.1 All Cause 30-Day Readmission Rate (Stand-alone Measure)	$14,114,233
126686802.2.5 Implement/Expand Care Transitions Programs UT Southwestern Medical	2.12.1 - Implement a care transitions program at the University hospitals	IT-1.10 Diabetes: HbA1c poor control (>9.0%) (NQF 0059) (Stand-alone Measure) IT-3.1 All Cause 30-Day Readmission	$17,201,722

Project Title (include unique RHP project ID number for each project)	**Brief Project Description**	**Related Category 3 Outcome Measure(s)** (include unique Category 3 Improvement Target (IT) Identifier specific to RHP and outcome title)	**Estimated Incentive Amount (DSRIP) for DYs 2-5**
Center – Faculty Practice Plan 126686802		Rate (Stand-alone Measure)	
126686802.2.6 – Pass 2 Conduct Medication Management Program UT Southwestern Medical Center – Faculty Practice Plan 126686802	2.11.2 - Implement enhanced patient medication management program to improve health outcomes	IT-3.12 Other - readmission rate - complications of medications readmissions	$6,589,027

Section III. Community Needs Assessment

Section III. Community Needs Assessment

To develop the Community Needs Assessment, a regional Task Force was convened by representatives from the following organizations: Baylor Health Care System, Children's Medical Center, Dallas County Medical Society, Dallas County Behavioral Health Leadership Team, HCA North Texas, Methodist Health System, North Texas Behavioral Health Authority, Parkland Health & Hospital System, Scottish Rite Hospital for Children, Texas Health Resources, UT Southwestern Medical Center, and ValueOptions of Texas.

This Task Force reviewed and identified the regional needs through data analysis, expert presentations, and committee discussions. The major criteria used to identify and rank regional priorities included population impact, alignment with intervention categories, and whether solutions lend to regional based approaches. The following priorities were identified as the region's major community health needs:

Capacity - Primary and Specialty Care - The demand for primary and specialty care services exceeds that of available medical physicians in these areas, thus limiting healthcare access.

Behavioral Health - Adult, Pediatric and Jail Populations - Behavioral health, either as a primary or secondary condition, accounts for substantial volume and costs for existing healthcare providers, and is often utilized at capacity, despite a substantial unmet need in the population.

Chronic Disease - Adult and Pediatric - Many individuals in North Texas suffer from chronic diseases that present earlier in life, are becoming more prevalent, and exhibit complications.

Patient Safety and Hospital Acquired Conditions – Hospitals in the region address patient safety and care quality on a daily basis. It is a continuous improvement initiative and is always at the forefront of any strategy for a health care entity. An ongoing coordinated effort among providers is needed to improve patient safety and quality throughout the region.

Emergency Department Usage and Readmissions - Emergency departments are treating high volumes of patients with preventable conditions, or conditions that are suitable to be addressed in a primary care setting. Additionally, readmissions are higher than desired, particularly for those with severe chronic disease or behavioral health.

Palliative Care - Overall, costs are high in skilled nursing facilities, long term care facilities, hospice and home health sectors, and slightly higher in physician services.

Oral Health - In Texas, preventive dental visits are below the recommended levels, and access can be a problem for minorities, the elderly, children on Medicaid, and other low income children. Compounding the issue is the shortage of dentists in Texas at approximately 60% of the national ratio of dentists to the population.

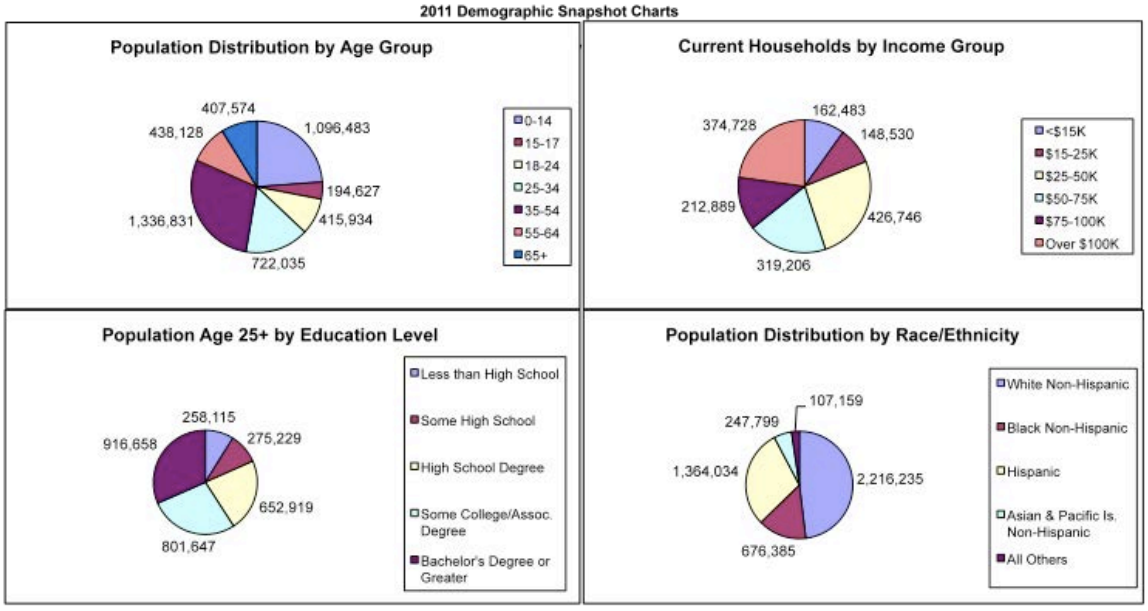
Demographics and Regional Description

Based on population alone, Texas is the second largest state in the nation with more than 25 million people. From 2000 to 2010, Texas experienced a 20% growth in population, as compared to only a 9.7% increase nationally. Originally, the North Texas RHP 9 Region was defined to include Collin, Dallas, Denton, Ellis, Fannin, Grayson, Kaufman, Navarro, and Rockwall counties. The broader demographics were considered to be representative of the narrower final RHP boundaries and as demonstrated in Figure 3 below, there is considerable in-migration from the original RHP counties to Dallas County for health care services.

In the North Texas RHP 9 region (original definition), the 2011 population is estimated to be 4,611,612 and is expected to grow by 9.5% by 2016 to 5,048,283 residents.[3] The most prevalent age group is 35-54 years (27.6%), followed by the 0-14 age group (20.2%). While 15.1% of adults have less than some high school level of education, approximately 85% of adults have at least a high school degree.

White non-Hispanics represent 48.1% of the population, followed by Hispanics, Black non-Hispanics, Asians, and others, respectively.[4] Approximately 44% of Dallas-Fort Worth residents are New Americans (defined as either foreign born or the children of foreign born) of which 46% are undocumented. English is not the language spoken in 32% of homes in North Texas and over 239 languages are spoken in the North Texas Area, with more than 1/3 reflecting African cultures new to the region.[5]

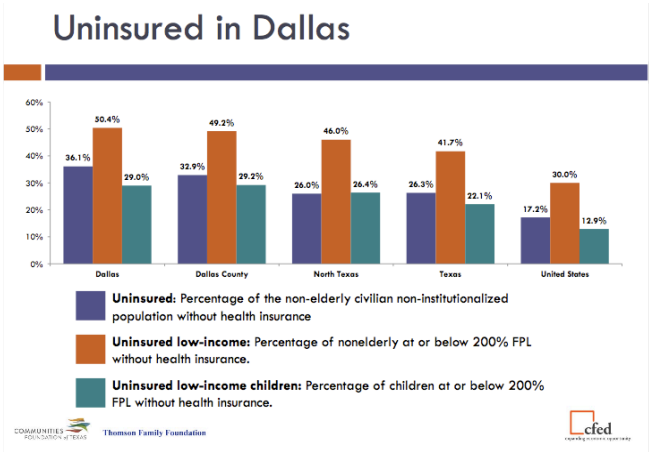
Figure 1: Regional Demographic Snapshot



[3] US Census Data, Thompson Reuters/Claritas Market Expert Data Extract, 2012.
[4] ibid.
[5] DFW International Community Alliance. 2010 North Texas Progress Report.

Within Dallas County specifically, 29.6% of children under 18 live below the federal poverty level and 15.8% of adults between 18 to 64 years live below the federal poverty level.[6]

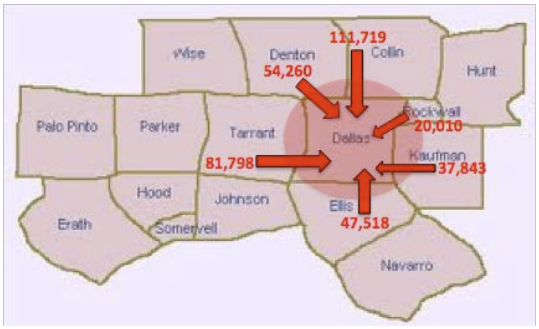
Figure 2: Summary of Uninsured in Dallas County[7]



Health Delivery System and Patient Migration Patterns

Data analysis identified patient migration patterns within multiple RHP regions. Many individuals receive healthcare services in nearby counties. In the pediatric population, Dallas County residents account for 75% of the outpatient services and 74% of the inpatient services. In the adult population, Dallas County residents account for 77% and 73% of the outpatient and inpatient population, respectively.[8]

Figure 3: Interconnectedness of Healthcare Delivery System: Dallas County Encounters from Patients with Adjacent County of Residence, 2011[9]



The locations of charitable clinics in Dallas County are shown on the map below. Additional analysis is warranted to determine the causal factors of the patient flow and migration patterns and how they relate to the locations of clinics/other service sites in the region. It is apparent though that the data presents strong justification to consider a broader geographic area for the purposes of this assessment.

Regional Health Care Capacity

Physician Supply and Availability

RHP 9 is affected by the limited physician capacity in primary and select specialties. According to the Health Professions Resource Center, primary care physician supply trends have consistently increased to a current statewide rate of 70 per 100,000 people in 2011.[11] In 2011, the RHP 9 region demonstrated a physician need in excess of over 30% of the current workforce and by 2016 the physician need is expected to be 50% higher than projected availability.[12] With such a shortage of physicians, which is disparately worse in rural areas of Texas, many residents seek primary care and non-emergent treatment in emergency departments, resulting in increased healthcare costs and higher volumes of preventable and avoidable cases in the ED.

Medical Education

Dallas County is home to the University of Texas Southwestern Medical Center, an academic medical center that trains over 1000 medical students and approximately 1300 clinical residents annually. Many training and residency placements are completed within the DFW Metroplex providing an important source of physicians to the local healthcare system.

Medically Underserved and Shortage Areas

A Health Professional Shortage Area (HPSA) is a federally designated geographic area, a facility or population group with a shortage of primary care physicians (or dental or mental health providers) as defined by a population-to-primary care physician ratio of at least 3,500:1 in

[10] Parkland Health & Hospital System. Charitable Clinic Locations Report. 2012.
[11] Health Professions Resource Center, Center for Health Statistics, Department of State Health Services, October 2011.
[12] ibid.

addition to other requirements designated by the U.S. Department of Health and Human Services.[13] Poverty rate, infant mortality rate, fertility rate and physical distance from care are all considerations in scoring for HPSA designation.

Medically Underserved Areas or Populations (MUA/MUP) are generally defined by the federal government to include areas of populations with a shortage of personal health care services or groups of people who may have cultural or linguistic barriers to health care. In RHP 9, Dallas County has significant HPSA and MUA regions that overlap and Kaufman County is a county-level HPSA with no MUAs.

Children/Youth

The impact of the limited primary and specialty care is profound for children and families in the region. The current pediatric need is more than 80% of the current supply in the region. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of pediatric primary care access and treatment.[14] Data also indicates that many of the pediatric specialists have limited capacity, creating a backlogged pipeline for those needing specialty services after seeking primary care.

Behavioral Health

Behavioral Health System Structure and Funding

The behavioral health system (including mental health and substance use) in RHP 9 differs from that of the rest of the state in that the majority of behavioral services for Medicaid and indigent patients are delivered through the NorthSTAR program instead of the traditional Local Mental Health Authority (LMHA) system. It is a managed behavioral healthcare carve-out program, administered by ValueOptions of Texas under a Medicaid 1915(b) waiver under the oversight of the North Texas Behavioral Health Authority (NTBHA), and it provides both mental health and substance use treatment to over 60,000 Medicaid enrollees and indigent uninsured annually.

Over the past decade, the NorthSTAR program has greatly expanded access to care. However, this high level of access results in funding and infrastructure challenges. Since the program's inception, the growth in enrollment has outpaced funding such that the funding per person served is 30% less than when the program started in 1999 and is half that of the state average for other LMHAs[15]. Given that Texas is 50th in mental health funding nationwide[16], the funding per person served in RHP 9 is among the lowest in the nation.

Mortality Trends in the Behavioral Health Population

An inadequate supply of behavioral health services is one of the most significant unmet health needs of RHP 9. A recent study in Texas found that NorthSTAR was one of only four LMHAs in which age-adjusted mortality rates were significantly higher for the mental health population compared to the general population. Consistent with the NASMHPD study, the majority of

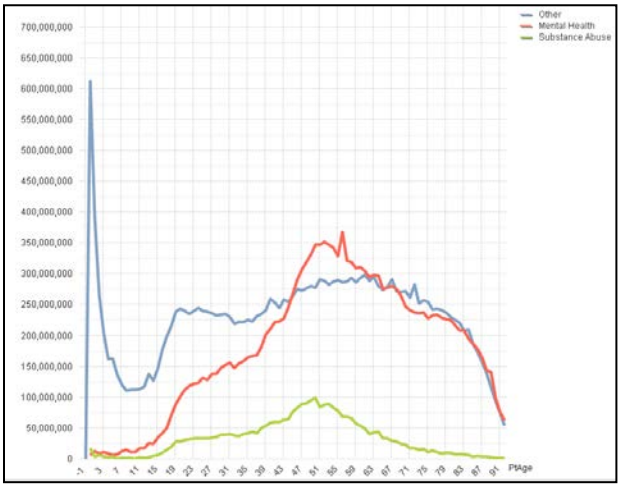
[16] National Alliance on Mental Illness. State Mental Health Cuts: The Continuing Crisis. March 2011.

deaths in this region were due to medical illness, and most of those were due cardiovascular disease.[17] The NorthSTAR system differs from the rest of the state in that it includes patients with primary diagnoses of substance use disorders, a preliminary analysis of death records showed similar mortality rates between the mental health and substance abuse populations.[18]

Cost Trends in the Behavioral Health Population

The financial implications of caring for those with behavioral health conditions are substantial and impact resources within the healthcare institutions of RHP 9. Analysis of DFW Hospital Council Foundation data demonstrates that charges associated with the care of mental health patients more than doubles from $50,000,000 to over $100,000,000 between the ages of 17 through 21. Charges continue to rise through adulthood, and between the ages of 47-65, the estimated charges for mental health encounters are higher than those of all other conditions combined. When substance abuse encounters are included, this difference is even greater.[19]

Figure 5: Age and Charge Distribution by Mental Health and Substance Abuse Encounter (2010Q3-2011Q3)[20]



In RHP 9, the presence of a co-occurring behavioral health condition is associated with increased case severity of medical encounters and a 36% increase in the average charges per encounter. In RHP 9, 100% of the 10 most frequently admitted patients had a co-occurring behavioral health diagnosis depicted in Figure 5. These 10 individuals incurred a cost of more than $26 million between 2007 and 2011; however only 1/5 of their hospital emergency department visits were for a mental health or substance abuse issue. Sixty-one percent were uninsured (24% Medicaid, 12% Medicare, and 3% Insured).

The percentage of residents below 200% Federal Poverty Level in Dallas County who receive behavioral healthcare in primary care settings is 19.8% which is significantly lower than the national average of 37.1%.[21] Parkland, the largest primary care provider to low-income populations in Dallas County, is not a NorthSTAR provider and consequently, some who may be successfully served in primary care settings are referred to NorthSTAR. This may result in dilution of limited NorthSTAR resources, as well as coordination of care issues for those with high complexity co-occurring illness. An analysis of the diabetic population at Parkland revealed that diabetics receiving antipsychotic medications from the NorthSTAR system were twice as likely to receive second-generation antipsychotics, which adversely affect metabolic indicators associated with poor diabetes outcomes, compared to those receiving antipsychotics from the Parkland pharmacy.[22]

[21] TriWest/Zia Partners. Assessment of the Community Behavioral Health Delivery System in Dallas County, 2010.
[22] Balfour, ME et al. Highlighting High Utilizers: How can our systems better meet their needs? Institute on Psychiatric Services Annual Meeting, 2011.

The funding challenges combined with the complexity of the behavioral health system may adversely impact sub-populations with the highest needs. The number of NorthSTAR enrollees booked into jail has been steadily increasing as shown below in Figure 8[23], and 27% of all book-ins to the Dallas County Jail are currently referred to jail behavioral health services.[24] Homeless individuals with behavioral health conditions cost three times as much and are booked into jail twice as often as the general NorthSTAR population.[25] Among high utilizers, these relationships are magnified, as illustrated below.

Figure 8: Behavioral Health Patient Factors for Top 20% Utilizers of NorthSTAR, Dallas County Jail, and Terrell State Hospital, 2010

[25] Balfour, ME. Homelessness, Criminal Justice, and the NorthSTAR Top 200 Report, 2011.

Children/Youth

The number of Dallas County children receiving publicly funded mental health services has tripled from 2000 to 2010. In Dallas County, the number of children identified with a diagnosable emotional disturbance or addictive disorder has increased to approximately 142,000 children with 5% of those children experiencing a significant impairment as a result. Among youth between the ages of 12-17, 7.2% have experienced a major depressive episode.

Cultural and Linguistic Minorities

Hispanics comprise 40% of the population but only 25% of the NorthSTAR population.[26] While there is a lack of services available and written materials available in Spanish, it is difficult to characterize the extent of the need, because data on primary language is not collected.

Demand for Behavioral Health Services

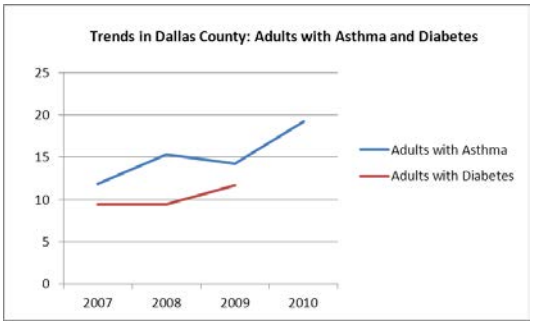
Following the economic downturn in 2009, there was a 17% increase in 23-hour observation visits at Green Oaks Hospital, mostly accounted for by new enrollees to NorthSTAR. More recently, there has been a sharp spike in 23-hour observation utilization, with Feb 2012 visits 26% higher compared to Dec 2011 (and 25% higher compared to Feb 2011).[27] This increase coincided with both regulatory oversight limiting the capacity of Parkland's Psychiatric ED by 50% and a reduction in funding for outpatient services in the NorthSTAR system.

In addition to hospital-type services, there is also a need for less-acute levels of behavioral care in order to prevent the need for these high-cost services. A sub-acute crisis residential level of care exists but there are only 21 beds for the entire NorthSTAR region. The Behavioral Health Leadership Team has identified the highest need for service development to be post-crisis "wraparound" services to reduce the 20% 30-day readmission rate to crisis services, and peer-driven services to engage clients early in order to prevent crisis episodes.

Chronic Disease

Similar to national trends, North Texas is experiencing increasing rates of many chronic diseases, including heart disease, cancer and stroke. Also there are increasing rates of asthma and diabetes in adults within the Dallas County Metropolitan Statistical Area as shown below.

Figure 10: Dallas County Adults with Asthma and Diabetes



In an assessment of ED utilization, the five encounter types that were most frequent and of highest volume are those for chronic conditions of asthma, chronic bronchitis, pain/aching of

[26] TriWest/Zia Partners. Assessment of the Community Behavioral Health Delivery System in Dallas County, 2010.
[27] ValueOptions of Texas

joints, sinusitis, and hay fever.[28] There were slight variations presented when encounters were analyzed by payer type. More Medicaid and uninsured patients sought treatment for asthma than those with insurance or Medicare and for the uninsured specifically, diabetes was listed as the 5th top condition, while not even listed as a top 5 condition for the insured or Medicaid.

Figure 11: Volume for Adult Outpatient Emergency Department Encounters (2010Q3 - 2011Q3)[29]

Highest Volume	1	2	3	4	5
All	Low Back Pain	Hypertension	Pain/Aching of Joints	Chronic Bronchitis	Asthma
Insured	Low Back Pain	Hypertension	Pain/Aching of Joints	Chronic Bronchitis	Asthma
Medicaid	Low Back Pain	Pain/Aching of Joints	Asthma	Chronic Bronchitis	Depression/ Anxiety
Medicare	Low Back Pain	Hypertension	Chronic Bronchitis	Pain/Aching of Joints	Diabetes
Uninsured	Low Back Pain	Pain/Aching of Joints	Hypertension	Asthma	Diabetes

Asthma

Over the past decade, asthma has become a widespread public health problem that has increased in both Texas and the United States. Asthma has a major impact on the health of the population and the burden falls unevenly on some populations. According to Texas Behavioral Risk Factor Surveillance System in 2005, approximately 1.5 million adults (ages 18 and older) and 389,000 children (ages 0-17) were reported to have asthma at the time.[30] And in 2006, the state of Texas spent over $391.5 million for inpatient admissions with a primary discharge diagnosis of asthma.[31]

In 2008, the state of Texas had a risk-adjusted admission rate of 72.5 per 100,000 cases.[32] Although Dallas County had a slightly higher rate at 89.1 per 100,000 cases, six of the ten counties surrounding Dallas County were significantly more burdened with a risk-adjusted admission rate of greater than 92.2 per 100,000 cases. Only one county of the ten had a lower risk-adjusted rate (Rockwall County) at 70.5 per 100,000 cases. Other North Texas counties' astham admission rates are shown in the table below.

15 Adult Asthma Admission Rate

Asthma is one of the most common reasons for hospital admission and emergency room care. Most cases of asthma can be managed with proper ongoing therapy on an outpatient basis. Most published studies combine admission rates for children and adults; therefore, areas may wish to examine this indicator together with pediatric asthma.

2008				Per 100,000 cases

<u>Diabetes</u>

Diabetes affects 11.4% of the population in Dallas County, which is above both the state average of 10% and the national average of 8%. In patients seen throughout the regional healthcare system and who are residents of Dallas County, the top five primary diagnoses, those patients with an underlying condition of diabetes were 29% for pneumonia, 39% for septicemia, 31% for other rehabilitation, 34% of urinary tract infection and 45% of acute kidney failure.[33] Those with diabetes had a higher mortality percentage than those without in four of the five top inpatient diagnoses revealing that a co-morbidity of diabetes increases your risk for mortality.

Dallas County's top seven diagnoses for ER patients were Acute URI Unspecified, Otitis Media, abdominal pain, chest pain unspecified, urinary tract infection, headache and other chest pain. Within those top seven diagnoses, 20%-45% had an underlying condition of diabetes. Specifically, of all patients who came to the ER with chest pain as a diagnosis, 21%-25% had a comorbidity of diabetes. Of patients presenting with abdominal pain, urinary tract infections and headache, 10% also had diabetes.

[33] Doughty, P. et al. Diabetes in Dallas County: Provider Report. 2011

Figure 12: Prevalence of Co-Occurring Diabetes, Dallas County 2009-2010

Top Five Diagnosis **INPATIENTS 2009-2010 Dallas County**	Number of Patients	Number of Patients with Diabetes	% with Diabetes	Mortality %	Mortality % with Diabetes
Pneumonia	4,359	1,279	29%	3.1%	3.5%
Septicemia	3,142	1,217	39%	21.4%	23.0%
Other Rehabilitation	2,816	872	31%	0.1%	0.1%
Urinary Tract Infection	2,447	822	34%	0.5%	0.6%
Acute Kidney Failure Unspecified	2,355	1,068	45%	3.2%	3.5%
Top Seven Diagnosis **ER VISITS 2009-2010 Dallas**	Number of Patients	Number of Patients with Diabetes	% with Diabetes	Mortality %	Mortality % with Diabetes
Acute URI Unspecified	23,979	392	2%	0%	0%
Otitis Media	18,576	84	0%	0%	0%
Abdominal Pain	14,677	1,516	10%	0%	0%
Unspecified Chest Pain	14,511	3,010	21%	0%	0%
Urinary Tract Infection	14,302	1,254	9%	0%	0%
Headache	13,531	1,228	9%	0%	0%
Other Chest Pain	13,217	2,980	25%	0%	0%

Children/Youth. Between 2000 and 2010, the number of Children's Medical Center admissions of youth with a primary or secondary diagnosis of diabetes increased by 34%. With the association of diabetes and obesity, there is also cause for concern of the future trajectory as low income preschool obesity within the Dallas Metropolitan Statistical Area was 17.2% in 2009, placing many young children at higher rates of developing diabetes in later years.[34]

Cost/Charge. Isolation of a specific "direct cost" is complicated. However, it is understood that the societal burden for this condition is extremely large and has manifestations in healthcare service utilization due to increases complexity and severity of other co-occurring medical conditions. Additionally, there are important societal costs of lower economic productivity of individuals with severe diabetic complications. The magnitude of the issues is only projected to increase as more people begin to develop diabetes at earlier in life.

Patient Safety and Quality and Hospital Acquired Conditions

The DFWHC Foundation's 77 hospitals had 1,706 adverse hospital events in 2010. These events included air embolism, Legionnaires, Iatrogenic Pneumothorax, delirium, blood incompatibility, glycemic control issues and Clostridium difficile, which are not part of the ten adverse events specified by CMS. A significant portion was made up of Medicare patients (46%) and insured (54%) according to the claims data within the DFWHC Foundation claims data warehouse.

Emergency Department Usage and Readmissions

An analysis of the emergency department encounters demonstrates that many in the population are accessing emergency departments for both urgent and non-urgent conditions. Over the most recent four quarters of data, the conditions for which the most volume of care

[34] Children's Medical Center. Beyond ABC Report, 2010.

was provided in an emergency outpatient setting were: low back pain, hypertension, pain/joint aching, chronic bronchitis, and asthma.

Further assessment demonstrates that, with the exception of asthma, over 68% of the encounters for the top primary health conditions listed above were either non-emergent or emergent/primary care treatable, in that the care could have been provided effectively in a primary care setting. For asthma, approximately 98.1% of all encounters were emergent, however the condition could have been potentially avoidable or preventable if effective ambulatory care could have been received during the illness episode.[35]

For emergency department encounters that resulted in a hospital admission, the most common health conditions by volume include stroke, diabetes, congestive heart failure, weak/failing kidneys, chronic bronchitis and heart attack. When reviewing by payer type, diabetes is the top condition for the uninsured and Medicaid and the 5th top condition for those who are insured.

Figure 14: Adult Inpatient Emergency Department Encounters (2010Q3 - 2011Q3)[36]

Highest Volume	1	2	3	4	5
All	Stroke	Congestive Heart Failure	Weak/Failing Kidneys	Chronic Bronchitis	Diabetes
Insured	Stroke	Weak/Failing Kidneys	Congestive Heart Failure	Heart Attack	Diabetes
Medicaid	Diabetes	Congestive Heart Failure	Weak/Failing Kidneys	Stroke	Chronic Bronchitis
Medicare	Congestive Heart Failure	Stroke	Weak/Failing Kidneys	Chronic Bronchitis	Heart Attack
Uninsured	Diabetes	Stroke	Weak/Failing Kidneys	Congestive Heart Failure	Heart Attack

Specific to children, the high volume ED encounters includes asthma, diabetes, pain/aching joints, and arthritis most frequently. Regardless of payer type, asthma and diabetes are the top conditions for ER and inpatient admissions.

Figure 15: Pediatric Inpatient Emergency Department Encounters (2010Q3 - 2011Q3)[37]

Highest Volume	1	2	3	4	5
All	Asthma	Diabetes	Pain/Aching of Joints	Arthritis	Congestive Heart Failure/Liver Condition
Insured	Asthma	Diabetes	Pain/Aching of Joints	Arthritis	Liver Condition
Medicaid	Asthma	Diabetes	Arthritis	Congestive Heart Failure	Pain/Aching of Joints
Uninsured	Asthma	Diabetes	Pain/Aching of Joints	Arthritis	Liver Condition/Low Back Pain

[37] Ibid.

In North Texas, all-cause readmissions as defined by a subsequent admission within 30 days from the incident encounter of any type has demonstrated a downward trend since 2008.[38] Many hospitals are working to continue improvement in this area, specifically for readmission related to congestive heart failure, acute myocardial infarction, and pneumonia.

As evidenced by an assessment of 10 individual high utilizers in the region, there is a strong relationship between readmissions and behavioral health. Each patient has some component of mental health or substance abuse history over the course of their encounter history.

Cost/Charge

From quarter 3 of 2010 to quarter 3 of 2011, the estimated charges associated with all regional emergency outpatient encounters was $312,816,490 and for emergency inpatient encounters, the total charges increase to $2,076,778,420. For emergency inpatient encounters, there was little charge variation across insured, Medicaid, Medicare, and Uninsured payer types.

Palliative Care

Palliative care is an important factor in the care delivery system of RHP 9. Overall, Medicare reimbursements to providers in Dallas County are higher than average and higher than the 50th percentile in the country during a patient's last two years of life signifying a large volume of palliative care services being provided. Even within the health service area of RHP 9, there is variability of the percentage of deaths occurring within hospitals, ranging from 0.69 percent to 1.17 when compared to the national average.

Oral Health

Tooth decay (dental caries) is the most common chronic childhood disease. In 2003, the proportion of Texas children reported to have teeth in excellent or very good condition was lower than the national average and lower within all age, sex, and racial/ethnic subgroups.

[38] DFWHC Foundation, Information and Quality Services Database, 2010.

Figure 17: Oral Health – Condition of Teeth for Texas Children (2003)

	Condition of Teeth: Excellent or very good		Preventive Dental Care: ≥ 1 Visit within Past Year	
	US %	Texas %	US %	Texas %
Age Group				
All children 0–17	64.3	57.6	67.6	61.6
Age (years)				
1–5	75.8	70.7	46.8	48.4
6–11	61.7	50.9	83.4	74.8
12–17	67.4	61.2	79.4	69.7
Socioeconomic status				
0–99% Federal poverty level	45.4	40.7	54.1	56.0
100–199% Federal poverty level	56.5	48.9	61.6	52.6
200–399% Federal poverty level	71.2	66.7	73.0	67.4
≥400% Federal poverty level	78.1	78.3	77.8	73.3
Race/ethnicity				
White	69.3	65.4	70.6	64.4
Black	57.4	53.4	62.6	64.9

Dental problems in adults are equally problematic. According to the U.S. Surgeon[39] most adults in the U.S. show signs of periodontal or gingival diseases and severe periodontal disease affects 14 percent of adults (ages 45–54 years). However, a little less than two-thirds of adults report visiting a dentist within the past 12 months, and those with incomes at or above the poverty level are twice as likely to report a dental visit in the past 12 months as those below the poverty level. The American Dental Association cited the major reason for not accessing regular oral health care is the high cost of dental care. And the number of individuals who lack dental insurance is more than 2.5 times the number of those who lack medical insurance.

Effective health policies intended to expand access, improve quality, or contain costs must consider the supply, distribution, preparation, and utilization of the workforce. According to the National Health Service Corps, Texas needs 784 additional dentists to achieve the recommended ratio of one dentist for every 3,000 residents. The overall supply of dentists in Texas has been consistently below the national average of 59-60 dentists per 100,000 for many years.[40] In 2006, Texas had 36.0 dentists per 100,000 and it has been declining since.

Summary

Additional analysis and information is presented in Appendix B.

Section IV. Stakeholder Engagement

Section IV. Stakeholder Engagement

A. RHP Participants Engagement

In November 2011, as the prospects for approval of the proposed Section 1115 Medicaid waiver titled "Texas Healthcare Transformation and Quality Improvement Program" were becoming favorable, the Parkland Health & Hospital System (Parkland) administrative and board leadership requested Dallas Medical Resource assistance in the formation of a Dallas regional healthcare partnership and plan.

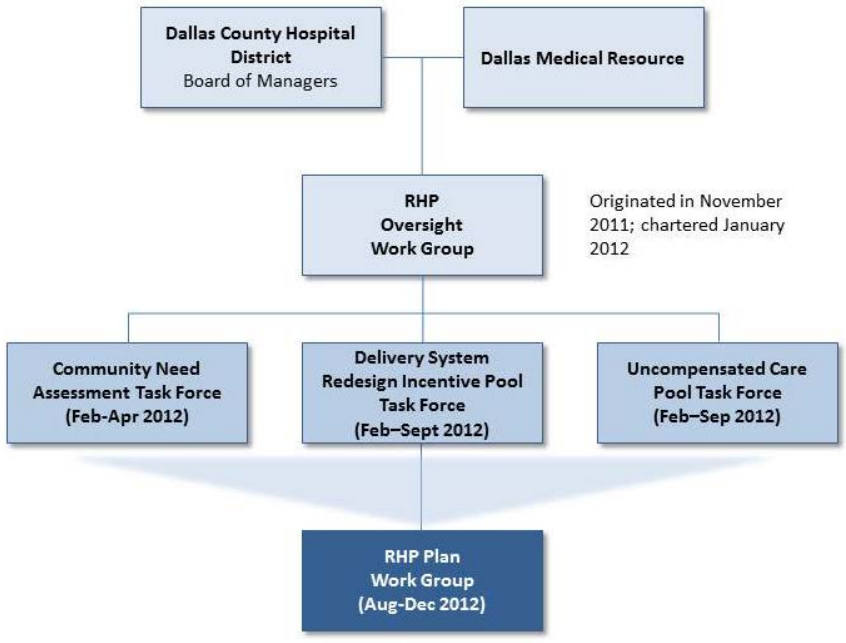
11.17.11 Letter from Parkland to DMR

"The development of the RHPs will be complicated and will require significant stakeholder involvement and community leadership. We believe that Dallas Medical Resource would be the perfect organization to help us initiate the discussions and assist us in the formation of a Dallas RHP and would formally request DMR's assistance."

Dallas Medical Resource (DMR) established in 1989 by the Greater Dallas Chamber of Commerce, is devoted to addressing major issues impacting the health of the Region's citizens and the health care delivery system. It is a partnership between the leaders of the business community and the medical and health care community. DMR serves as the forum for these groups to work together on such issues as supporting Parkland Health and Hospital System.

On November 22, 2011, DMR responded affirmatively to Parkland's request and proposed the organizational structure presented below for the RHP development. The structure was adopted and has been used throughout RHP 9's Plan development.

In partnership, DMR and Parkland have successfully engaged the participation of a broad array of stakeholders throughout the RHP 9's organizational journey.



The Work Group (steering committee representing Parkland, the performing providers, the business community and the medical society) and each of the task forces were led by Parkland and non-Parkland co-chairs. The Community Needs Task Force was co-chaired by

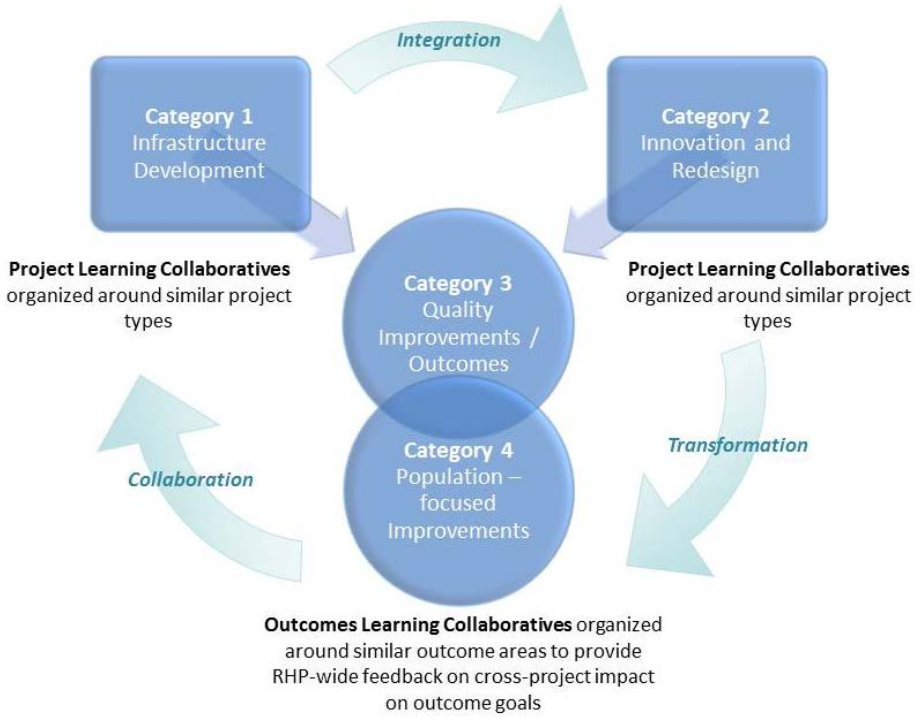
Steve Love, President and CEO of the Dallas-Fort Worth Hospital Council (DFWHC) and Jody Springer, Parkland. The DFWHC Foundation staff was commissioned to lead development of the Needs Assessment. The Delivery System Redesign Incentive Pool Task Force was co-chaired by Drs. Ron Anderson, Parkland, and David Ballard, Baylor Health Care System. The Uncompensated Care Pool Task Force was co-chaired by John Dragovits, Parkland, subsequently his successor, Ted Shaw, Parkland and Fred Savelsbergh, Baylor Health Care System. The RHP Plan Work Group was responsible for writing the RHP 9 plan using the work produced by the DSRIP and UC Task Forces. The RHP Plan Work Group was co-chaired by Jody Springer, Parkland and Fred Savelsbergh, Baylor Health Care System. The Task Forces and Work Groups were populated with representatives of the performing providers and other stakeholders constituting RHP 9. In addition to the appointed task force and work group members, meetings were open to attendance by additional representatives of the stakeholder organizations. There was consistent and regular meeting attendance by all stakeholders.

The oversight steering committee Work Group met monthly/bi-monthly receiving and acting on recommendations from the work group and task forces. The task forces generally met weekly throughout their respective terms. The work groups and task forces maintained meeting minutes. The RHP Plan Work Group from its establishment in August met frequently, often weekly. A meeting calendar and examples of meeting agendas / minutes have been included in Appendix D-1.

RHP 9 has enjoyed broad, diverse and actively engaged participants throughout this planning year as is reflected in Section I. In a view held among all of the RHP 9 participants, the engagement and collaboration generated throughout this planning year has already had substantial yield for the region in relationship building, coordination and cooperation among stakeholders. As the DSRIP projects are finalized and approved, RHP 9 will come together to develop an implementation structure that will govern the RHP throughout DY 2 through DY 5.

Project and Outcomes Learning Collaboratives

The figure that follows demonstrates the approach that RHP 9 will use to establish an innovative and productive learning and sharing environment. A twofold strategy is envisioned to approach the organization of learning collaboratives.



The *project* learning collaboratives will be structured around Category 1 and 2 projects so that best practices, methodologies and learning can be shared among the providers directly involved in similar interventions. In addition, *outcome* learning collaboratives will be organized around sets of aligned Category 3 and 4 outcome measures that cross multiple Category 1 and 2 projects. For example, an outcome learning collaborative might be established around chronic disease measures. There may be opportunities to create productive information sharing and feedback loops that will inform and improve the intervention effectiveness throughout the course of the RHP 9 plan. While the outcome learning collaboratives will focus primarily on the Category 3 measures, the population-focused Category 4 reporting indicators will also inform this work.

Each learning collaborative will maintain ongoing documentation of challenges encountered, solutions generated, lessons learned, process changes made, and results produced through the work of the collaborative.

RHP 9 will invest time and resources early in the implementation phase of the RHP 9 plan to assure the clinical, technical and development support is in place to establish a strong and appropriately organized and resourced learning collaborative model. The collegial relationships, communication, shared practices and technology (such as our Sharepoint site) established and utilized throughout the development of the RHP 9 Plan will be leveraged in the learning collaboratives.

Plan Conduct and Monitoring

RHP 9 will monitor the transformational impact that the plan has on the region. This will provide an opportunity for RHP 9, as a collective of independent organizations, to:

- Hold ourselves and one another accountable for progress toward goals,
- Learn together and help each organization to succeed,
- Recalibrate our interventions if they are not producing the desired impact,
- Continue to engage and enlarge the region stakeholders, and
- Reach out and assure bi-directional communication with the public.

In sum, RHP 9's participants are looking forward to embarking on the RHP 9 Plan's implementation.

B. Public Engagement

The formation of Region Nine took place over an extended period of time and was finalized in early August 2012. Throughout this formation period, there was considerable interaction with elected officials and other interested parties. It has been the intent and practice for RHP 9 to maintain full transparency. In May 2012 while the regional boundaries were still being determined, the completion of the Community Needs Assessment provided an opportunity to promote public awareness. The Needs Assessment was presented to the Parkland Board of Managers in May 2012 which resulted in an article in the Dallas Morning News.[41]

In August 2012, Parkland created a web site-let to provide information regarding Waiver, development of RHP 9 Plan and to provide an on-line opportunity for input. As of November 15, 2012, the website had 197 entrances and a total of 783 page views. From the time the web site went live, it has included a form to accept questions or comments.

It has been the policy and practice of RHP 9 to remain open to questions, comments and feedback throughout the Plan development process. Comment periods were not restricted and feedback has been and continues to be welcomed.

Pass 1 Public Meeting

On November 7, 2012, RHP 9 hosted its public meeting related to the submission of its Pass 1 plan. The meeting was held at 6:30 p.m. at the Dallas County Commissioners Court in Dallas. Parking fees were waived for meeting attendees.

On October 31, 2012, the informal notice for the public meeting and a web-ready notice were distributed to each participant in the RHP requesting that the notice be widely distributed and posted throughout the region. The notice provided the URL for the Parkland web site-let for the Medicaid 1115 Waiver.

The meeting notice was posted on November 2, 2012 in accordance with the posting policies and practices of Parkland. In addition, At the regular Dallas County Commissioners Court Meeting on November 6, the upcoming public meeting was highlighted and all interested parties were encouraged to attend for information and comment. Attendees were encouraged to directly questions and comments to the web site-let.

[41] Study: Dallas-Fort Worth lacks enough doctors to meet needs of growing population [http://www.dallasnews.com/health/headlines/20120522-study-dallas-fort-worth-lacks-enough-doctors-to-meet-needs-of-growing-population1.ece]

The materials presented in Appendix E-2 were posted on the Parkland Waiver website and distributed in hard copy to all meeting attendees. The public meeting was videotaped and is posted on You Tube[42]. As a result of the meeting, an article was written and appeared on the lower fold of the Dallas Morning News[43] front page and provided information to a very wide audience. The article is included in Appendix E-2. The draft plan to be submitted for Pass 1 was posted on the Parkland-sponsored website on November 15, 2012.

Pass 2 Public Meeting

To provide geographic access, the second public hearing was held in the Denton County Commissioners Court on December 18, 2012 at 6:30 p.m..

On December 11, 2012, the informal notice for the public meeting was distributed to each participant in the RHP requesting that the notice be widely distributed and posted throughout the region. The notice provided the URL for the Parkland web site-let for the Medicaid 1115 Waiver

The formal meeting notice was posted December 11, 2012 in accordance with the posting policies and practices of Parkland.

The materials presented in Appendix E-2 were posted on the Parkland Waiver website and distributed in hard copy to all meeting attendees. The draft plan to be submitted for Pass 2 was posted on the Parkland-sponsored website on December 18, 2012. The public meeting was videotaped and is posted on You Tube available through the Parkland 1115 Waiver website[44].

The Parkland web site-let for the Medicaid 1115 Waiver has a form by which the public can ask questions or post comments. No feedback was received through this channel from the point of the announcement of the public meeting to Pass 2 plan submission on December 31, 2012.

* * *

The Parkland web site-let will continue to post updates and remain available to receive public feedback throughout the period of plan review and finalization. RHP Nine will continue to update and engage stakeholders using a strategy that will be developed through the implementation organizational structure.

Section V. DSRIP Projects

Section V. DSRIP Projects

A. RHP Plan Development

Number of Category 1 and 2 Projects in RHP 9 Plan

RHP 9 is characterized as a Tier 2 Region in accordance with the Program Financing and Mechanics Protocol. As a Tier 2 Region, RHP 9 is required to include a minimum of 12 projects from Categories 1 and 2 combined, with at least 6 of the 12 projects selected from Category 2.

The following table presents the count of projects included in the Region 9 plan. Upon the completion of the First Pass, Region 9 far exceeded the Protocol requirement.

Projects	Pass 1	Passes 2 and 3	Total	Required
Category 1	31	13	44	-
Category 2	58	18	76	At Least 6
Total	89	31	120	Total 12

Project Development Process

As described in Section IV – Stakeholder Engagement, for the first half of calendar 2012 the RHP 9 DSRIP Task Force participants engaged actively in deliberations regarding potential DSRIP projects that would address identified community health needs and align with the DSRIP project menu. This work was intended to stimulate creative and collaborative project opportunities for RHP 9.

As the DSRIP project menus approached finalization, a broadly representative plan writing work group was formed to review, vet and formalize potential projects. At well-attended meetings on September 5, 2012 and September 11, 2012, RHP 9 performing providers formally presented to their regional peers their projects being considered for plan submission. Meeting participants provided constructive criticism, identified opportunities for collaboration and inter-entity project alignment. At the end of each of the two sessions, a representative from each participating organization submitted on behalf of his/her organization a project "grade" for each project. Subsequently the average grade for each project was tabulated and the results circulated. This transparent process produced significant shared learning, a collective awareness of the developing projects, and opportunities to improve each project.

Following the RHP 9 DSRIP review process, performing providers refined their projects and secured their IGT entity funding. To assure alignment with the intent of the waiver program and to provide information to support project valuation, all RHP 9 performing providers completed a project valuation worksheet. As described more fully in subsection B. below, the worksheet collected a self-assessment on the six dimensions that RHP 9 considered important including: Transformational Impact, Population Served/Project Size, Alignment with Community Needs, Cost Avoidance, Sustainability, and Partnership Collaboration.

RHP 9 Project Priorities

Upon completion of the Community Needs Assessment and in consultation with the DSRIP Task Force, the Community Needs Task Force identified seven priority areas that formed the nexus for shaping community goals. In consideration of the community needs, the intent of the waiver and the performing provider priorities, the RHP 9 participants shared a commitment to address the following:

- **Improving Access to Health Care Services** - for the region's most vulnerable populations with an emphasis on increasing capacity and reducing constraints in: Primary Care, Specialty Care, Behavioral Health Services, Palliative and Oral Health services. The delivery system will work to provide appropriate capacity so that patients can access the right care in the right setting at the right time avoiding care in more costly and less patient-centered settings.
- **Improve Coordination and Management of Care to the Individual Patient Across the Continuum** – so that patients can navigate the often complicated and fragmented delivery system which presents an even greater challenge to the most vulnerable patients. The Medical Home was embraced as the model that embodies the intent of a patient-centered approach to wellness, self-management and the prevention of disease exacerbation. RHP 9 believes that providing the connectivity among the health systems and care sites around the needs of the individual patient can yield tremendous benefits to the individual patient, the health of the population and to the community at large.
- **Improve Quality, Cost and Outcomes Performance of Health System Providers** – to improve the quality of care and services, improvem patient safety, reduce and/or eliminate harm to patients, provide an excellent patient experience and improve the cost effectiveness of care in all settings.

The RHP 9 participants believe that the three focal points outlined above are very consistent with the CMS triple aim to improve care for individuals (including access to care, quality of care and health outcome); improve health for the population; and lower costs through improvements (without any harm whatsoever to individuals, families or communities). The RHP 9 projects are designed to fit and promote one or more of the above three program goals.

Project Selection

To promote transparency within the region, RHP 9 established and hosted Sharepoint site. All projects and plan development materials have been filed on the shared site so that all RHP 9 participants can have access to and share information regarding all of RHP 9's projects. Through this approach, all RHP 9 participants have had full access to all of the plan development activities.

Through an iterative process, the early projects concepts have matured into the set of projects that have been submitted in the RHP 9 plan. Each project advances one or more of the three broad regional priorities described above. A complete list of projects developed, considered and selected for Passes 1, 2 and 3 are presented in Appendix F.

Process to Implement Pass 1, Pass 2 and Pass 3

Collectively, the RHP 9 participants reviewed the Program Funding and Mechanics Protocol to understand both its mechanics and intent. Before engaging in Pass 1, RHP 9 mapped out and modeled the full range of projects and participation for the DSRIP program that was desired by the region. Because of the particular circumstances regarding the MHMR funding in RHP 9, the RHP participants agreed to establish a "set aside" of approximately $60 million for future behavioral health projects to be developed, if possible, through the plan modification process. As the regional plan took shape, each performing provider entity reconfirmed the IGT commitment(s) for their DSRIP projects.

For Pass 1, those entities that were able to participate, submitted the projects that achieved their DSRIP objectives and aligned with their IGT capacity or committed support. Pass 1 proceeded in accordance with the expectations that had been mapped in advance.

In Pass 2, the additional entities that were eligible to engage submitted their projects. And, as anticipated, several Pass 1 performing providers submitted additional projects. To facilitate the additional Pass 2 participation, Parkland entered into collaboration agreements to assure that the allocated DSRIP dollars would be made available to support the desired projects.

For convenience, the Texas A&M Health Science Center, Baylor College of Dentistry participated in Pass 3. As a whole, the RHP 9 participants collaborated to assure that there was strong and broad participation in the DSRIP program.

Performing Providers Exempt from Category 4 Reporting

The table below lists the Performing Providers who are exempt from Category 4 reporting according to the criteria in paragraph 11.e. in the Program Funding and Mechanics Protocol.

Provider Type	TPI	Performing Provider
Physician Practice Plan Affiliated with an Academic Health Science Center	126686802	The University of Texas Southwestern Medical Center
County, Local Health Department	121758005	Dallas County Health and Human Services
County, Local Health Department	136360803	Denton County Health and Human Services
County MHMR	135234606	Denton County MHMR
County MHMR	137252607	Metrocare
County MHMR	121988304	Lakes Regional MHMR Center
Physician/Dentist Practice Plan Affiliated with an Academic Health Science Center	009784201	Texas A&M Health Science Center, Baylor College of Dentistry

B. Project Valuation

The RHP 9 Performing Providers considered a number of different valuation approaches that could be used as a general basis for the region. It was decided that an approach using a general value weighting process for all of the Region's Performing Providers could could be used as the primary or a supporting basis for each provider's project valuation. A worksheet tool was prepared to capture the relative value of each project and to create an overall weighted score for each project. The worksheet tool and related scoring guidance is presented in Appendix G. The table below presents the scoring and weighting design.

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%		
Population Served / Project Size	25%		
Alignment with Community Needs	20%		
Cost Avoidance	15%		
Sustainability	15%		
Partnership Collaboration	5%		

Performing providers completed the scoring tool for each project under consideration for inclusion in the plan. The weighted score was used as the basis for allocating each Pass 1 Hospital's funding allocation to potential DSRIP projects. The project-specific funding allocation information was shared among the performing providers so the values could be compared among like projects. Many providers augmented this method with several additional methods including:

- Detailed econometric models
- Consideration of outcomes related values
- Detailed assessment of returns on investment
- Valuation models collaboratively built specific to their provider types

There are variations in the project valuations, even among like types of projects, due to a number of factors and conditions including but not limited to the following:

- Geographic market segment targeted by the project
- Size and concentration of Medicaid and low-income patients to be served by the project
- Complexity of the project
- Scarcity of provider availability to implement the project
- Density or paucity of other health services in the area
- Priority and importance of the project to the provider with respect to achieving the Waiver priorities

Each performing provider considered and weighed the many factors surrounding valuation and submitted the project values that they believed best aligned with each project.

C. Category 1: Infrastructure Development

Project Option 1.1.1 – Establish More Primary Care Clinics

Unique Project ID: 195018001.1.1
Performing Provider/TPI: Trinity MC, LLC dba Baylor Medical Center at Carrollton/ 195018001

Provider: Baylor Medical Center at Carrollton is a 235-bed acute care facility located in Carrollton. The medical staff is comprised of over 500 physicians representing more than 50 specialties. Baylor Carrollton is a full service hospital providing comprehensive diagnostic, surgical, and medical care for inpatients and outpatients, as well as 24-hour emergency care. Baylor Carrollton's service area represents a population of 592,000.

Intervention(s): This project will implement a new Patient-Centered Medical Home (PCMH) clinic designed to provide comprehensive and high-quality primary care services to underserved (including Medicaid/Uninsured) patients in the Carrollton/Denton County service area.

New v. existing initiative: This project entails building a new PCMH clinic serving a new population of Uninsured and Medicaid patients in the Carrollton/Denton county area.

Need for the project: There are no clinics in the Carrollton area to provide primary care for the undeserved population. Access to quality primary care services has been demonstrated to improve health outcomes and reduce avoidable hospital utilization among underserved patient populations. This project will increase access to primary care for the underserved population.

Target population: The uninsured population in Denton County is 20.9% (equates to approximately 144,000 uninsured individuals). Clinic capacity will allow approximately 400 new patients per year to receive services. We expect that about 90-95% of the new patients/year will be uninsured/Medicaid patients.

Category 1 or 2 expected patient benefits: The project seeks provide a PCMH for 400 patients in DY4 and an additional 400 patients in DY5.

Category 3 outcomes: The Baylor Clinic at Carrollton will be a new clinic, therefore the metric baseline and projected achievements are estimates based off of historical performance from other Baylor Clinics.

- IT-1.7: Controlling High Blood Pressure. Our goal is to increase the number of patients with controlled blood pressure (< 140/80 mmHg) from 45.0% in DY4 to 50.4% (or 5.4% total improvement over established baseline) in DY5.

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (clinic wait times). Our goal is to increase patient satisfaction from 80% in DY4 to 82% in DY5 (or 2% improvement over established baseline).

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (timely response to patient phone calls). Our goal is to increase patient satisfaction from 85% in DY4 to 86.5% (or 1.6% improvement over baseline) in DY5.

- IT-12.1: Breast Cancer Screening. Our goal is to increase the number of appropriate women who receive breast cancer screenings from 38.3% in DY4 to 41.3% in DY5 (or 3% improvement over baseline)

- IT-12.5: Other USPSTF screening outcome (Influenza Vaccination). Goal is to increase the number of adults 18+ who receive influenza vaccination from 62% (DY4) to 63.9% in DY5 (or 1.9% improvement over baseline)

Project Description

This project would establish a new clinic for the underserved (including Medicaid/Uninsured) population on the Baylor Medical Center at Carrollton campus. Currently, there is no Baylor Clinic on the campus that serves the underserved population of Carrollton and surrounding communities. We would use existing space to furnish a primary care clinic leveraging and utilizing the standards, requirements and experience of similar Baylor Clinics on other Baylor campuses. This project is a brand new endeavor and requires infrastructure modifications/ construction,physician recruitment, staff and capital expenditures and we anticipate to be operational in late DY3/early DY4. We plan on starting to see patients in DY4. We expect that approximately 90-95% of new patients will be Medicaid/Uninsured. In addition to receiving primary care, this project also proposes that ancillary services such as labs, imaging (i.e.: CT scans, MRI, mammograms, ultrasound, echocardiograms, and interventional radiology) and diagnostics (i.e.: colonoscopy, stress tests, esophageal diagnostic, retinal screens) provided upon physician request. This project aims to provide a baseline of primary care availability, close the loop of care and increase patient compliance by co-locating/ coordinating many of the essential services that the underserved population often has issues accessing and completing.

Goals and Relationship to Regional Goals

The 5 year goals of this project are: (1) to build out, staff and establish a primary care clinic setting on the Baylor Medical Center at Carrollton campus, (2) to provide a primary care setting and PCP to a greater number of the underserved population in the Carrollton and Denton County areas, (3) provide volume relief to surrounding providers' EDs, (4) begin improve patients' health outcomes and status and (5) begin the creation of an integrated primary care model for underserved patients in Denton County to receive high quality, complete care keeping these patients from utilizing the emergency department for low acuity needs and preventing re(admissions) that could have been avoided with proper primary care.

The Region has a primary care provider and capacity issue for the underserved population. This issue is even more prevalent in Carrollton, where there is very little primary care availability for the underserved population. There are only 2 clinics available in the Carrollton area, creating access issues for patients in the community that are not near these clinics. This project will

increase access to primary care and provide high quality, comprehensive care to patients in a less costly setting. ED utilization is high in RHP 9 and by providing more patients with primary care they need, the goal is to keep them from using the ED as a means to receive basic care.

Challenges

Providers and hospitals are reluctant to expand primary care capacity in charity clinics due to the inherent necessity for other downstream services, procedures, and costs associated with adding a patient with multiple, complex needs from the underserved population. Additionally, there is not enough primary and specialty care providers and services supply to meet the demand from this population. Basic primary care needs are unable to be fulfilled because of the lack of funding and capacity to take more patients, thus leading to increased (re)admissions and prevalence of disease complications. Lastly, due to the transient nature of this population, it is difficult to achieve the full extent of quality and clinical outcomes associated with a Patient Centered Medical Home. This project addresses these challenges by creating a low-cost, effective, co-located and comprehensive model specifically for the underserved population.

5-year expected outcome for the performing provider and patients

At the end of 5-years, 800 new, unduplicated patients will have received PCMH/primary care services at the Baylor Clinics on the Baylor Medical Center at Carrollton Campus. We expect to be operational and seeing patients by DY4.

Starting point/baseline

There is no established baseline for this project. It is a new initiative on the Baylor Medical Center at Carrollton, where we will be establishing a new primary care clinic to care for the underserved population in Carrollton/Denton County. We do know that 20.9% of the population in Denton County is uninsured.[45] This equates to 144,000 patients in Denton County that do not have insurance and may need a PCP/primary care setting to receive care.[46] In addition, we know that there were over 14,000 Medicaid cases that presented to the Carrollton ED over the past 3 years. Lastly, Baylor Clinics that are similar in size and scope are able to serve anywhere from 600-1300 unduplicated patients per year. We anticipate that our volumes in DY4 and DY5 will be about 400 patients per year. We plan on recruiting patients directly from the Baylor Medical Center at Carrollton inpatient units and emergency department through a care navigation service located in the hospital as well as leveraging relationships with other community partners in Denton county.

Rationale

We chose this project option because of the demonstrated need in the RHP and to leverage our PCP/PCMH model to patients in the Carrollton area. According to the Community Health Needs

[45] Healthy People North Texas: http://www.healthyntexas.org

[46] Census Quick Facts: http://quickfacts.census.gov/qfd/states/48/48121.html

Assessment, 100% of the counties in the region are designated as medically underserved areas and 20.9% of individuals in Denton County are uninsured.[47] The combination of these two factors leads to increased ED utilization and clinical complications due to lack of adequate access to coordinated, primary care services. According to the Dallas Fort Worth Hospital Council database, 68% of ED visits related to the top conditions in the region was non-emergent /primary care treatable. The top five conditions from the ED that resulted in an inpatient admission were: stroke, diabetes, congestive heart failure, weak/failing kidneys, chronic bronchitis and heart attack. These services can be better coordinated and managed in a primary care setting, ensuring the patient 1) receives the care they need, 2) adequate follow-up is provided after these types of services are accessed and 3) providing these services in a timely fashion so that long term disease complications and other issues are avoided. Baylor Clinics have a proven track record for improving patient outcomes and creating primary care capacity in underserved areas. By leveraging this model and expertise a new primary care setting on the Baylor Carrollton campus would be a service to the community and to the patients.

Project Components

For this project, our plan is to focus on: 1) establish space, 2) recruit physicians, 3) develop clinic protocols and operational processes, 4) hire staff and make any capital investments, 5) recruit patients to be seen in the clinic. We will also engage in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness. These continuous quality improvement activities will be especially relevant as we establish the clinic and evaluate how to better serve the community and improve quality outcomes for the patients we see in the clinic.

Reasons for selecting the milestones and metrics

The chosen milestones and metrics are more heavily focused on process - establishing the clinic, infrastructure, processes and operations. In the latter years, the focus is on increasing the number of patients seen and to positively affect their clinical outcomes. We plan on measuring outcomes such as patient satisfaction, blood pressure, screenings and immunizations because they are a few of the core components of quality medical care for these underserved patients. We also plan on engaging in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project and 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness.

Unique community need identification number the project addresses:

CN.3- Healthcare Capacity

Describe how the project significantly enhances an existing delivery system reform initiative

[47] RHP 9 Community Health Needs Assessment

This project has not received any funding from any federal source. It enhances current delivery system reform initiative by focusing on providing high quality, low cost and comprehensive primary care services to the underserved population. It encourages decreased utilization of unnecessary specialty care, ED utilization and promotes better preventive services to avoid downstream complications and costs. It exemplifies the Triple Aim from the Institute of Healthcare Improvement's three components of better care, better health and lower cost.

Related Category 3 Outcome Measures

Note: For all of the below outcome measures, we are using estimates based on historical performance of other Baylor Clinics. Therefore, we may need to reevaluate these metrics and determine different thresholds once the clinic is operational in DY4. Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Outcome Measure #1: IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone measure). Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED admissions[48]. A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population,[49] who make up 22.5% of the RHP 9 population and 9% of the Denton County population. Patients who are uncontrolled will receive the attention they need to get their hypertension under control.

Outcome Measure #2 and #3: IT-6.1 Percent Improvement over baseline of patient satisfaction scores (Standalone measure). Outcome Measure #2 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times.* Outcome Measure #3 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls.* Establishing high patient satisfaction scores will be important at the Baylor Clinic on the Baylor Medical Center at Carrollton campus in order to ensure patients come and continue to come to the clinic to receive the care they need. We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes.

[48] RHP 9 Community Health Needs Assessment

[49] http://health.nytimes.com/health/guides/disease/hypertension/complications.html

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007[50] has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED.

The following two outcome measures focus on adult preventive services. Adult Preventive services as recommended by USPSTF are low cost, highly effective interventions that prevent and maintain patients' health status. Again, because we do not have a baseline for any of these metrics, we have relied on historical performance of a similar Baylor Clinic on another campus. We believe these preventive screenings and services are an important part of basic primary care and have potential for immediate results in the short term time horizon.

Outcome Measure #4: IT-12.1 Breast Cancer Screening (Non-Standalone Measure). In Denton County, the incidence rate of breast cancer is 126.6 cases/100,000 females, much higher than the Dallas County rate of 23.7/100,000. This statistic is considered to be way higher than the national average. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.[51]

Outcome Measure #5: IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate). In Denton County, there are 32.6 deaths/100,000 people due to influenza and pneumonia. This rate is much higher than the national average of 19.6.[52] The rate of African American age adjusted death rate due to influenza/pneumonia is 70.8 deaths/ 100,000, two times greater than the Caucasian rate in Denton County.[53] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Relationship to other Projects

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. The exchange of best practices and shared learning contributes significantly to CQI and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor Medical Center at Carrollton has computed the value of this project using the model developed

at the Regional level and has discounted the value since the new clinic will not be operational until DY3/early DY4.

Baylor Medical Center at Carrollton defined the population that will be directly impacted by the project as 800 underserved patients in the Carrollton area of the 144,000 uninsured in Denton County. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual, we concluded that, on a scale of 1 –5, the value of this project is a ***4.*** We believe this because the project entails providing a basic PCP/PCMH setting for underserved patients who do not have one. This alone has a large impact on the individual in being able to meet basic healthcare needs and receive necessary medical attention. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***4.*** We believe this to be the correct number because, when these patients receive healthcare, they are able to manage their conditions better and in a timely manner, remain productive members of society, stay out of the ED and avoid costly clinical exacerbations.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars, taking the regional cap of funding into consideration.

Project Option 1.9.2 - Improve Access to Specialty Care-Expand Specialty Care Services

Unique Project ID: 195018001.1.2
Performing Provider/TPI: Trinity MC, LLC dba Baylor Medical Center at Carrollton/ 195018001

Provider: Baylor Medical Center at Carrollton is a 235-bed acute care facility located in Carrollton. Baylor Carrollton provides a broad spectrum of medical and health care services to the people of North Dallas. The medical staff is comprised of over 500 physicians representing more than 50 specialties. Baylor Carrollton is a full service hospital providing comprehensive diagnostic, surgical, and medical care for inpatients and outpatients, as well as 24-hour emergency care. Baylor Carrollton's service area represents a population of 592,000.

Intervention(s): This project will increase access to needed specialty care services (i.e. outpatient visits with specialty physicians, hospital-based procedures) for uninsured patients under the care of the new Baylor Clinic in Carrollton.

New v. existing initiative: This is a new project to Baylor Carrollton and will provide access to specialty care services previously unattainable for Medicaid/Uninsured patients.

Need for the project: Specialty services are a key element to providing a full continuum of care to patients (beyond what can be provided in a primary care clinic) and an important contributor to improved health outcomes and avoidance of costly clinical exacerbations. Shortage of specialty care was one of the key health needs identified in the RHP.

Target population: The target population will be a subset of established Baylor clinic patients who require specialty services. While historical data suggests 10-15% of all established patients will develop a need for specialty services, constraints in available specialists and facilities should allow the project to serve approximately 5% of all established patients within a given year. At least 90% of patients served in this project will be Medicaid/Uninsured.

Category 1 or 2 expected patient benefits: The specialty care project in Carrollton will not be implemented until DY4. Over the course of DY4 and DY5 an estimated 50 individual patients will be connected to specialty care services.

Category 3 outcomes: The Baylor Clinic at Carrollton will be a new clinic, therefore the metric baseline and projected achievements are estimates based off of historical performance from other Baylor Clinics:

- IT-11.1: Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma metrics. Our goal is to improve performance of our Asthma metrics Percent of Opportunities Achieved (POA) to 30% (or 10% improvement over established baseline) completed in DY5.

- IT-12.2: Cervical Cancer Screening. Our goal is to increase the number of appropriate women receive screenings from 52.5% in DY4 to 54.9% in DY5 (or a minimum of 2.4% improvement over baseline).

- IT-12.3: Colorectal Cancer Screening. Our goal is to increase the percentage of appropriate patients receive screenings from 24% in DY4 to 27.8% in DY5 (or a minimum of 3.8% improvement over baseline).

Project Description

Patients (including Medicaid and Uninsured) who are seen at a Baylor Clinic and have established primary care there, can receive the following specialty care services: certain outpatient procedures such as: office visits with specialists, wound care, and facility based procedures such as cardiac catheterizations, certain surgeries (i.e.: gall bladder/hernia), excision of masses (breast, lymphoma), and cataract removal. This project excludes transplants, oncology and perinatal services. The specialty care referral and coordination would come from the clinic per request by the patient's PCP. These services would not be available until DY4 when the Baylor Clinic on the Baylor Medical Center at Carrollton is operational.

Goals and Relationship to Regional Goals

The goals for this project are to 1) increase/improve access to specialty care services, 2) engage a greater number of providers/facilities to provide these services, 3) increase the number of completed specialty referrals for patients and 4) improve disease specific clinical outcomes affected by increased access to target specialists. As a result, we expect that more patients will have a better quality of life when they are given the appropriate specialty care, in a timely manner and in the appropriate venue. By managing the patient and coordinating the care through the primary care clinic, we expect the patient will have fewer complications post procedure. Because these specialty care services will not start until DY4, we hope to establish a level of care in the community during the remaining years in the waiver. Depending on the community need, outcomes and improvements may vary. According to the Community Health Needs Assessment, the demand for primary and specialty care services exceeds that of available physicians, thus limiting healthcare access for many low level management or specialized treatments for health conditions[54]. This project would help to offset some of the demand for specialty care services and do so in a coordinated and meaningful way. The patients who need specialty care services, both inpatient and outpatient, would require a referral from their Baylor Clinic to receive the procedure and then also be able to follow-up with their PCP after the procedure/test is completed. This synchronizes with the regional needs of providing access to more specialty care and also coordinates the care for the patient to ensure compliance timely care. As patients receive the specialty care they need, it is likely that clinical

[54] RHP 9 Community Health Needs Assessment

exacerbations of manageable conditions will decrease, lowering the cost of care in more expensive settings.

Challenges

The major challenges with providing increased access to specialty care are multiple: 1) lack of supply of specialty providers in the Region and even smaller supply who are willing to provide specialty care services to this population, 2) specialty care is expensive to provide for patients who have little or no ability to pay. Major procedures/surgeries can be a financial burden for performing providers and related entities, 3) there is often a long wait list for patients to receive specialty care, leading to clinical exacerbations due to less timely care and 4) there is no coordination or follow-up for patients who do receive specialty care leading to infections, healing issues and lack of wound management which can often lead to a (re)admission to the hospital. Through developing community relationships with providers and facilities in the area, we plan to find ways to provide more access points for these patients to receive the care they need, in a timely manner so that we are can monitor utilization and outcomes to be good stewards of the limited specialty care resources available in the Region.

5-year expected outcome for the performing provider and patients

The 5 year expected outcome of increasing access to specialty care is to provide specialty care to approximately 54 unduplicated patients over the waiver period through increasing the number of providers/facilities contracted to at least 6. Lastly, we expect to begin to help facilitate the coordination and collaboration of specialists and primary care providers for our patients. We hope that by engaging specialists to do more complex procedures as well as preventive services that this will help create a more robust care team that will benefit the entire community. Because these services will begin in DY4, it is possible that these expectations will occur toward the end of DY5 and beyond the waiver period.

Starting Point/ Baseline

Currently, there are no specialty care referrals provided for the underserved population in Carrollton. The baseline, therefore has not been closely tracked. A major focus of this project will be to more accurately capture baseline data and formalize the specialty care referral process starting in DY4. Historic data on specialty care demand amongst Baylor Clinic patients suggests that 10-15% of all patients develop a need for specialty care services at some point in their care. The constraints of limited specialty care providers and facilities willing to care for this population have allowed similar programs in the area to meet demand for approximately 5% of a clinic's patient population.

Rationale

A key strategy for the Baylor Clinics has been the expansion and establishment of primary care access for the underserved population. Increased access to primary care has been strongly correlated with better health outcomes and lower avoidable hospital utilization within this patient population. While primary care providers are able to manage and treat many conditions, historic experience suggests that 10-15% of a clinic's patient population will likely develop a specialty care need at some point. Left untreated, this 10-15% of patients is likely to develop further exacerbation of health problems, experience more complications and increase the likelihood of avoidable hospital utilization. Additionally, as part of an effort to create a complete and robust care team for our patients, making specialty care part of that team is essential. We chose this project option to supplement our latter goal of engaging specialty care physicians in providing the more complex and advanced procedures/screenings but also to conduct some basic preventive screenings and education for the patient. We feel that this will make specialists a formal part of the overall care team. The new Baylor Clinic at Carrollton will have to establish relationships with providers in the community and as the clinic grows, we plan to leverage and expand those relationships in order to serve more of our patients. As Baylor Clinics take on more patients from the community, we anticipate that there will be an increased need for specialty care services in this population. This project proactively creates increased specialty access for these new patients as well established clinic patients who have historically had poor access to specialty care.

Project Components

We will complete all required project components for the expansion of specialty care project:

a) Increase service availability with extended hours: we will increase service availability by offering more appointments to patients in the outpatient setting and coordinate with surrounding hospitals to provide the inpatient services the patient may need

b) Increase number of specialty clinic locations: we plan to contract with at least 6 providers/facilities over the course of the waiver, providing more locations for patients to receive the specialty care they need

c) Implement transparent, standardized referral processes across system: we already have a standard referral form and process which is documented in the EHR and is visible to staff; but we will work to improve tracking, reporting and collection of referral data

d) Conduct quality improvement for project using methods such as rapid cycle improvement: we will engage in 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to integrate the specialist into the care team as much as possible.

The milestones and metrics chosen for this project really focus on developing a baseline of specialty care for underserved patients in Carrollton. Improvement of coordinating the care for patients to receive specialty care and more of it will come in the latter years once patients are seen at the Baylor Clinic and begin to receive specialty care services. The Region has demonstrated a need to improve access to specialty care and fulfill some of the gaps that have been identified in the care that is unavailable. Our metrics and milestones are structured as such and the specialties identified will be a priority as the project progresses and more facilities/providers are contracted with to provide these services. Other metrics focus on increasing the number of appropriate referrals which entails identifying patients early on when certain minor procedures can be completed in lieu of more expensive alternatives. Lastly, we have set specific metrics around the number of patients who will be served to ensure that actual patient lives are impacted and specialty care is delivered to these individuals.

Unique community need identification number the project addresses

CN.3- Healthcare Capacity, CN.9- Specialty Care

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any source of federal funding and has been identified as a significant Regional need. It enhances the existing delivery system reform initiative by coordinating specialty care through a primary care setting; thus managing utilization, costs and reducing complications for patients. This project would supply the specialty care needs identified by the Region and individual providers but also ensures that utilization is controlled.

Related Outcome Measures

Based on our projected ability to contract with certain specialists available in the area, we have chosen outcome measures below that will be addressed upon establishing relationships with the specialties mentioned below. Also, these services will not begin until DY4 and the outcome measures below are based off of previous historical performance of similar Baylor Clinics during their preliminary years of operation.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone measure). We plan on measuring the improvement in Asthma for Baylor Clinic patients. Asthma affects about 19.6% of the Dallas County population and was identified as one of the top five conditions for cause of ED visits in the Region. Approximately 90.1% of these ED visits related to Asthma could have been handled in the outpatient setting. [55] At Baylor Health Care System, we have standard Asthma metrics: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate what we call: The Percent of Opportunity Achieved (POA). This is calculated by dividing the total number of services or

[55] RHP 9 Community Health Needs Assessment

targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period. For an illustrative example: For Asthma- there are 4 opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Outcome Measure #1: IT-12.2 Cervical Cancer Screening (Non-Standalone Measure). In Region 9, the incidence rate of cervical cancer is higher than the national average. In Denton County, the incidence rate of cervical cancer is 5.9 cases per 100,000 people.[56]According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women[57]. There is opportunity to increase screenings in the minority population through engaging OB/GYNs to provide screenings/education for this population. Additionally, these specialists can provide advanced screenings/education that would not be available in primary care settings.

Outcome Measure #2: IT-12.3 Colorectal cancer screening (Non-Standalone Measure). In Denton County the incidence rate of colorectal cancer is 40.0 cases per 100,000. It is the second leading cause of cancer related deaths in the US and as many as 60% of the deaths from colorectal cancer could be avoided with regular screening tests.[58] There is a definite need for these services in Denton County and the Baylor Clinic plans to provide these screenings to a greater number of people. There is greater need for patients to receive (appropriate) sigmoidoscopies/ colonoscopies in the region as a preventive measure. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.[59] There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Denton County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Relationship to other Projects

[7] National Cancer Institute: http://www.cancer.gov/

[58] Healthy People North Texas: http://www.healthyntexas.org

[59] Centers for Disease Control and Prevention: http://www.cdc.gov/

Increasing access to specialty care is related to the project of expanding primary care capacity for two reasons: 1) as more patients enter the PCMH, there will be an increase in the need for specialty care services and 2) primary care is essential to coordinate the specialty care and to allow for adequate follow-up for the patient, in order to avoid any complications or issues that may arise after the specialty care is received

Related Category 4 Population-focused improvements

Many of the metrics listed here can be avoided or be less severe with adequate primary care follow up. While complications and failures that occur in the hospital cannot be avoided through just providing specialty care, many of the post-operative and minor procedures can be handled in the outpatient setting. Some of the inpatient specialty care proposed to be provided under this project would directly be tied to some of the Category 4 metrics.

RD-1.1, RD-1.4, RD-2.1, RD-2.4, RD-2.5, RD.2.7; RD-3.1, RD-3.3, RD-3.4, RD-3.5, RD-3.7, RD-3.8, RD-3.10, RD-3.11, RD-3.13, RD-3.14, RD-3.15, RD-3.16, RD-3.20, RD-3.21, RD-3.22, RD-3.27, RD-3.37, RD-3.38, RD-3.40, RD-3.41, RD-3.44, RD-3.45, RD-3.36, RD-3.48, RD-3.51, RD-3.52, RD-3.53, RD-4.1, RD-4.2

Relationship to Other Projects

In addition to Baylor Medical Center at Carrollton (Trinity), projects to expand specialty care are submitted by the following system entities:

- Baylor Medical Center at Garland: 121790303.1.2
- Baylor Medical Center at Irving: 121776204.1.2
- Baylor University Medical Center: 195018001.1.2

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

The following providers have projects to expand specialty care access:

- Parkland Health & Hospital Center – 127295703.1.5
- UT Southwestern – Faculty Practice Plan – 126686802.1.5

Our project aims to open access to patients who could not otherwise receive the specialty care they need and will require coordination and collaboration with other performing providers in the region. Our project does not 1) serve the same specialty care population as the aforementioned projects and 2) we plan on having a broader scope of specialty care services offered through our Baylor Clinic

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain

additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. This methodology is consistent with our approach in our other RHPs*. Baylor Medical Center at Carrollton has* computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Carrollton defined the population that will be directly impacted by the project as *underserved individuals in the Carrollton and Denton County area* that access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual, we concluded that, on a scale of 1 –5, the value of this project is a ***3.***We believe this to be the correct number because, when a person is positively impacted, their ability to maintain their health and address their complex health needs will be addressed. People will receive the procedures, diagnostics, etc. that they previously were unable to afford or could not have access to. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1-5, the value of this project is a *3.* We believe this to be the correct number because, when a person is positively impacted, clinical exacerbations are lessened and they incur less costly procedures/surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we allocated dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of dollars taking the regional cap of funding into consideration.

Project Option 1.1.2 - Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

Unique Project ID: 121790303.1.1
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): This project will implement increased access to two Patient-Centered Medical Home (PCMH) clinics designed to provide comprehensive and high-quality primary care services to underserved patients in the Baylor Medical Center at Garland service area The project is an expansion of Baylor's Clinic strategy in Garland and Dallas County. Historically, Baylor's Community Care clinics have provided access to patients following discharge from Baylor Medical Center at Garland. This expansion will focus on the recruitment of more underserved (Medicaid/Uninsured) patients from the community at-large and patients awaiting access to other public resources.

Need for the project: Access to quality primary care services has been demonstrated to improve health outcomes and reduce avoidable hospital utilization among underserved patient populations. This project will increase access to a PCMH for more patients in the community. .

Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH. Clinic capacity will allow approximately 600 new patients/year to receive services. We expect that about 90-95% of the new patients/year will be uninsured/Medicaid patients.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 1,700 new patients from the Garland community.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period. All baselines will be reevaluated and reestablished in DY2

- IT-1.7: Controlling High Blood Pressure. Our goal is to increase the number of patients with controlled blood pressure (< 140/80 mmHg) from 47.3% currently to 54.8% (or a total of 7.5% improvement over baseline) in DY5.
- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (clinic wait times). Our goal is to increase patient satisfaction from 86.8% currently to 88.7% in DY5 (or a total of 1.9% improvement over baseline).

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (timely response to patient phone calls). Our goal is to increase patient satisfaction from 90.3% currently to 91.7% (or a total of 1.4% improvement over baseline) in DY5.

- IT-12.1: Breast Cancer Screening. Our goal is to increase the number of appropriate women who receive breast cancer screenings from 37.8% currently to 46.7% in DY5 (or a total of 8.9% improvement over baseline)

- IT-12.5: Other USPSTF screening outcome (Influenza Vaccination). Goal is to increase the number of adults 18+ who receive influenza vaccination from 61.1% to 66.6% (or a total of 5% improvement over baseline) in DY5.

Project Description

The Baylor Clinic on the Baylor Medical Center at Garland campus, would expand their current capacity by opening their patient panels to non-Baylor patients (including Medicaid and Uninsured) and fully utilize the space and providers' capacity. Additional support staff will be hired to better coordinate patient care, ensure transition from the hospital to a Baylor Clinic and help to facilitate the care of the complex underserved patients. The Baylor Clinic on the Baylor Medical Center at Garland is already an NCQA recognized PCMH, thus the focus of this project would be to open the current panel to the underserved community and provide volume relief for other providers/ health systems in the area. We expect that approximately 90-95% of new patients will be Medicaid/Uninsured. Additionally, the clinic would provide these high quality primary care services to a greater number of people. In addition to receiving primary care, this project also proposes that ancillary services such as labs, imaging (i.e. CT scans, MRI, etc.) and diagnostics (i.e. colonoscopy, stress tests, retinal screens, etc.) would also be provided upon physician request. This project aims to close the loop of care and increase patient compliance by co-locating/coordinating many of the essential services that the underserved population often has issues accessing and completing.

Goals and Relationship to Regional Goals

The 5 year goals of this project are: (1) to provide a PCMH and PCP to a greater number of the Garland area underserved population, (2) provide continuity and transition to post-acute care services, (3) improve patients' health outcomes and status (4) create an integrated primary care model for underserved patients in Dallas County to receive high quality, complete care keeping these patients from utilizing the emergency department for low acuity needs and preventing re(admissions) that could have been avoided with proper primary care. The Region has a primary care provider and capacity issue for the underserved population. This project aims to address increasing access to primary care and providing high quality, comprehensive care to patients in a less costly setting. Emergency Department utilization is high in RHP 9 and by providing more patients with the primary care they need, the goal is to keep them from using the ED as a means to receive basic care.

Challenges

Providers and hospitals are reluctant to expand primary care capacity in charity clinics due to the inherent necessity for other downstream services, procedures, and costs associated with adding a patient with multiple, complex needs from the underserved population. Basic primary care needs are unable to be fulfilled because of the lack of funding and capacity to take more patients, thus leading to increased (re)admissions and prevalence of disease complications. Lastly, due to the transient nature of this population, it is difficult to achieve the full extent of quality and clinical outcomes associated with a Patient Centered Medical Home. This project addresses these challenges by creating a low-cost, effective, co-located and comprehensive model specifically for the underserved population.

5-year expected outcome for the performing provider and patients

At the end of 5-years, 1700 new, unduplicated patients will have received PCMH/primary care services at the Baylor Clinics on the Baylor Medical Center at Garland Campus. We expect that at least 15% of patients who continue to come to the Baylor Clinics will achieve better Adult Preventive Scores (APS) and have overall better clinical outcomes.

Starting point/baseline

From July 2010 to June 2011, the Baylor Clinics on the Baylor Medical Center at Garland served over 870 unduplicated patients. To date, there has not been a formal process to take patients from the community; capacity is typically reserved for those patients that come from a Baylor Medical Center at Garland ED. In addition to patients discharged from Baylor Medical Center at Garland, we will focus on 1,700 of the 872,000 uninsured patients in Dallas County.[60] We plan on recruiting patients into our Baylor Clinics through a combination of utilizing our inpatient care navigation services and furthering relationships with community partners. Currently, we have Care Navigators which proactively identify potential hospital patients that would be candidates to be seen in a Baylor Clinic. Also, through the creation of project 121790303.2.3 (navigation services for high risk patients), will provide additional patients to be seen at the Baylor Clinic. Lastly, our relationship with other providers and community partners will also serve as a referral source into the clinic.

Rationale

We chose this project option because of the demonstrated need in the RHP and to leverage our PCP/PCMH model to patients outside of Baylor. According to the Community Health Needs Assessment, 100% of the counties in the region are designated as medically underserved areas and 36.1% of individuals in Dallas County are uninsured.[61] The combination of these two factors leads to increased ED utilization and clinical complications due to lack of adequate access to coordinated, primary care services. According to the Dallas Fort Worth Hospital Council database, 68% of ED visits related to the top conditions in the county were non-emergent / primary care treatable. The top five conditions from the ED that resulted in an inpatient admission were: stroke, diabetes, congestive heart failure, weak/failing kidneys, chronic

[60] http://quickfacts.census.gov/qfd/states/48/48439.html

[61] RHP 9 Community Health Needs Assessment

bronchitis and heart attack. These services can be better managed in a primary care setting, ensuring 1) the patient receives the care they need, 2) adequate follow-up is provided after these types of services are accessed and 3) services are provided in a timely fashion so that long term disease complications are avoided. Baylor Clinics have a proven track record for improving patient outcomes and creating primary care capacity in underserved areas. Extending this model of care to non-Baylor patients would be a service to the community and patients. This project is a low-cost, high-quality solution to a pressing need in the community.

Project Components

a) *Expand primary care clinic space:* We will not be physically expanding the primary care clinic space, but we will be more fully utilizing the current space we have and will take advantage of underutilized space in the Baylor Clinic to see more patients. By carving out space to handle non-clinical needs such as finding community resources, education, coordinating care/appointments, etc., this will allow more room for providers to see patients and handle clinical needs.

b) *Expand primary care clinic hours:* We plan to expand our hours through the expansion of care teams. By adding (or modifying current roles of) mid-levels and other non-physician support staff, there will be more provider hours available, more appointment availability through expanding our current capacity from two appointment slots an hour to four (for example).

c) *Expand primary care clinic staffing*. We plan on hiring at least 2 FTEs to add to the care team in Irving in order to increase our capacity and services offered. We also plan to make the current staff hours more efficient so that more appointments per hour can be offered to patients.

The milestones and metrics that were chosen for this project are more heavily focused on improvement rather than process because much of the infrastructure and logistics are already in place because of the NCQA requirements for PCMH recognition. The Baylor Clinics at Baylor Medical Center at Garland are NCQA recognized[62], thus the focus of the metrics is on further improving and refining the PCMH baseline that has been established. Improvement metrics that hone in on increasing capacity, patient satisfaction and serving more patients are the impetus of this project. We also plan on engaging in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness.

Unique community need identification number the project addresses:

CN.3- Healthcare Capacity, CN.12-ED Usage and Readmissions

Describe how the project significantly enhances an existing delivery system reform initiative

[62] NCQA: http://www.ncqa.org

This project has not received any funding from any federal source. It enhances current delivery system reform initiative by focusing on providing high quality, low cost and comprehensive services to the underserved population. It encourages decreased utilization of unnecessary specialty care, ED utilization and promotes better preventive services to avoid downstream complications and costs. It exemplifies the Triple Aim from the Institute of Healthcare Improvement's three components of better care, better health and lower cost.

Related Category 3 Outcome Measures

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients got a PCMH at a Baylor Clinic.

Outcome Measure #1: IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone measure). Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED admissions[63]. A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population,[64] who make up 22.5% of the RHP 9 population[65] and 14.5% of the Garland population.[66] Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education about their illness in this clinic PCMH setting.

Outcome Measure #2, #3: IT-6.1 Percent Improvement over baseline of patient satisfaction scores (Standalone measure). Standalone measure). Outcome Measure #2 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times.* Outcome Measure #3 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls.* Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007[67] has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less

[66] Census Quick Track: http://quickfacts.census.gov/qfd/states/48/4829000.html

[67] Drain, M., Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction, however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED.

The following outcome measures focus on adult preventive services. Adult Preventive services as recommended by USPSTF are low cost, highly effective interventions that prevent and maintain patients' health status.

Outcome Measure #4: IT-12.1 Breast Cancer Screening (Non-Standalone Measure). In Dallas County, 23.7/100,000 women die from breast cancer with the rate in African American at 37/100,000. This statistic is considered to be higher than the national average. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.[68]

Outcome Measure #5: IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate). In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months[69]. The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Relationship to other Projects

121790303.2.1 Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program: The Chronic Care Management model will be integrated to ensure that high risk patients with chronic disease would be identified, addressed and managed.

PASS 2: 121790303.2.4 Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs - Vulnerable Patient Network (Home Visit Program)

121790303.1.2- Improve Access to Specialty Care-Expand Specialty Care Services: Improving access to specialty care is essential so patients can receive coordinated care/referrals to these services and necessary follow-up required for continuity of care in a primary care clinic setting.

121790303.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment

[68] Healthy North Texas: www.healthyntexas.org

[69] RHP 9 Community Health Needs Assessment

The project involving developing care management functions to integrate primary and behavioral health needs of individuals will provide co-located patient care services.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. This methodology is consistent with our approach in our other RHPs. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Garland defined the population that will be directly impacted by the project as *1700 underserved patients in the Dallas area of the 872,000+ uninsured in Dallas*

County. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project .To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe this because, this project entails providing a basic PCP/PCMH setting for underserved patients who do not have one. This alone has a large impact on the individual in being able to meet basic healthcare needs and receive the medical attention they need. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe this because, when a person is positively impacted, their dependence on community resources is better utilized and over time, will decrease. When these patients receive healthcare, they are able to manage their conditions better and in a timely manner, remain productive members of society, stay out of the ED and avoid costly clinical exacerbations.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.9.2 - Improve Access to Specialty Care-Expand Specialty Care Services

Unique Project ID: 121790303.1.2
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities of Wylie, Rowlett, Sachse, Mesquite and Murphy. Recognized for comprehensive services in heart and vascular care, diagnostic and interventional imaging, women's services, neonatal intensive care, sleep medicine, digestive disease, family medicine, and physical medicine and rehabilitation, Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000

Intervention(s): This project will increase access to needed specialty care services (i.e. outpatient visits with specialty physicians, hospital-based procedures) for uninsured patients under the care of a Baylor clinics in Garland. This is a new project, providing access to specialty care services previously unattainable for Medicaid/Uninsured patients.

Need for the project: Specialty services are a key element to providing a full continuum of care to patients (beyond what can be provided in a primary care clinic) and an important contributor to improved health outcomes and avoidance of costly clinical exacerbations. Shortage of specialty care was one of the key health needs identified in the RHP.

Target population: The target population will be a subset of established Baylor clinic patients who require specialty services. While historical data suggests 10-15% of all established patients will develop a need for specialty services, constraints in available specialists and facilities should allow the project to serve approximately 5% of all established patients within a given year. Between 90-95% of Baylor Clinic patients are Uninsured/Medicaid, we expect that patients served by this Specialty Care program will be at least 95% Uninsured/Medicaid.

Category 1 or 2 expected patient benefits: Over the course of DY2-DY5 an estimated 257 individual patients will be connected to specialty care services. This project will make the specialist part of the primary care team. Patients will receive better coordinated and timely care.

Category 3 outcomes: The Category 3 outcomes for this project were chosen because: 1) historical data from similar programs with specialists and 2) outcomes that have potential to show material improvement over a 2-3 year time period.

- IT-11.1: Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Bundle. Our goal is to improve performance of our Asthma metrics Percent of Opportunities Achieved (POA) from 73% completed opportunities currently to 76.9% (or 3.9% total improvement over baseline) completed opportunities in DY5.

- IT-12.2: Cervical Cancer Screening. Our goal is to increase the number of appropriate women receive screenings from 52.3% currently to 59.1% (or 6.8% total improvement over baseline) in DY5.

- IT-12.3: Colorectal Cancer Screening. Our goal is to increase the percentage of appropriate patients receive screenings from 33.5% currently to 40% (or 6.5% total improvement over baseline) in DY5.

Project Description

Patients (including Medicaid and Uninsured) who are seen at a Baylor Clinic and have an established PCMH there, can receive the following specialty care services: certain outpatient procedures such as: office visits with specialists, wound care, and facility based procedures such as cardiac catheterizations, certain surgeries (i.e.: gall bladder/hernia), excision of masses (breast, lymphoma), and cataract removal. This project excludes transplants, oncology and perinatal services. The specialty care referral and coordination would come from the PCMH clinic per request by the patient's PCP. Between 90-95% of Baylor Clinic patients are Uninsured/Medicaid, we expect that patients served by this Specialty Care program will be at least 95% Uninsured/Medicaid. Much of the value comes from building relationships, contracts and a network with local specialty care providers that can be easily accessible to this population. For Baylor Medical Center at Garland, one of the goals we have included in the project was to contract with providers in the community to create this specialty care network for the underserved population. Another facet of the project includes trying to make the specialist part of the primary care team. Through utilizing our electronic health record and specialty care referral coordinator, we hope engage specialists that provide procedures to also participate in the screening and educational needs of these patients. This is why we included Category 3 outcomes around Asthma improvement, Cervical and Colorectal cancer screening. We believe engaging specialists in these types of preventive services will help to integrate them into the primary care team. Sharing feedback through the electronic health record also will help to create a central repository of patient information and allow the care team to track and improve patient outcomes. Lastly, we expect value to come avoiding ED visits and more serious specialty care needs due to clinical exacerbations from not receiving timely and effective care.

Goals and Relationship to Regional Goals

The goals for this project are to 1) increase/improve access to specialty care services in the Garland area, 2) engage a greater number of providers/facilities to provide these services, 3) increase the number of completed specialty referrals for patients and 4) improve disease specific clinical outcomes affected by increased access to target specialists. As a result, we expect that more patients will have a better quality of life when they are given the appropriate specialty care, in a timely manner and in the appropriate venue. By managing the patient and coordinating the care through the Baylor Garland PCMH, we expect the patient will have fewer complications post procedure. According to the Community Health Needs Assessment, the demand for primary and specialty care services exceeds that of available physicians, thus limiting healthcare access for many low level management or specialized treatments for health

conditions[70]. This project would help to offset some of the demand for specialty care services and do so in a coordinated and meaningful way. The patients who need specialty care services, both inpatient and outpatient, would require a referral from their Baylor Clinic PCMH in order to receive the procedure and then also be able to follow-up with their PCP after the procedure/ test is completed. This synchronizes with the regional needs of providing access to more specialty care and also coordinates the care for the patient to ensure compliance timely care. As patients receive the specialty care they need, it is likely that clinical exacerbations of manageable conditions will decrease, lowering the cost of care in more expensive settings.

Challenges

The major challenges with providing increased access to specialty care are multiple: 1) lack of supply of specialty providers in the Region and even smaller supply who are willing to provide services to this population, 2) specialty care is expensive to provide for patients who have little or no ability to pay, 3) long wait lists to receive specialty care lead to clinical exacerbations and 4) no coordination or follow-up for patients who do receive specialty care leads to infections, healing issues and lack of wound management which can often lead to a hospital (re)admission. Through developing community relationships with providers and facilities in the area, we plan to find ways to provide more access points for these patients to receive the care they need, in a timely manner so that we are can monitor utilization and outcomes to be good stewards of the limited specialty care resources available in the Region.

5-year expected outcome for the performing provider and patients

The 5 year expected outcome is to provide specialty care to approximately 257 unduplicated patients through increasing the number of providers/facilities contracted to at least 9 in the Garland area. We also expect to increase the number of completed referrals for specialty care services 20% over baseline. Between 90-95% of Baylor Clinic patients are Uninsured/Medicaid, we expect that patients served by this Specialty Care program will be at least 95% Uninsured/Medicaid. Lastly, we expect to help facilitate the coordination and collaboration of specialists and primary care providers for our patients. We hope that by engaging specialists to do more complex procedures as well as preventive services that this will help create a more robust care team that will benefit the entire community.

Starting point/baseline

Currently, a small number of specialty referrals have been coordinated on a case-by-case basis with a limited network of specialty care providers and Baylor Medical Center at Garland. The baseline, therefore has not been closely tracked. A major focus of this project will be to more accurately capture baseline data and formalize the specialty care referral process. Historic data on specialty care demand amongst Baylor Clinic patients suggests that 10-15% of all patients develop a need for specialty care services at some point in their care. The constraints of limited specialty care providers and facilities willing to care for this population have allowed similar programs in the area to meet demand for approximately 5% of a clinic's patient population.

[70] RHP 9 Community Health Needs Assessment

Baylor Clinic patients are typically 90-95% Uninsured/Medicaid. We expect that about 95% of the patients we see in the Specialty Care program will be Uninsured/Medicaid patients.

Rationale

A key strategy for the Baylor Clinics has been the expansion of primary care access for the underserved population. Increased access to primary care has been strongly correlated with better health outcomes and lower avoidable hospital utilization within this patient population. While primary care providers are able to manage and treat many conditions, historic experience suggests that 10-15% of a clinic's patient population will likely develop a specialty care need at some point. Left untreated, this 10-15% of patients are likely to develop further exacerbation of health problems, experience more complications and increase the likelihood of avoidable hospital utilization. We chose this project to supplement our goals of engaging specialty care physicians in providing more advanced procedures/ screenings and also to conduct some basic preventive screenings and education for the patient. We feel that this will make specialists a formal part of the care team. Baylor Clinics have established relationships with providers in the community and as we grow, we will leverage those relationships in order to serve more of our patients. As Baylor Clinics take on more patients from the community, we anticipate that there will be an increased need for specialty care services in this population. This project proactively creates increased specialty access for these new patients as well established clinic patients who have historically had poor access to specialty care.

Project Components

We will complete all required project components for the expansion of specialty care project:

a) Increase service availability with extended hours: we will increase service availability by offering more appointments to patients in the outpatient setting and coordinate with surrounding hospitals to provide the inpatient services the patient may need

b) Increase number of specialty clinic locations: we plan to contract with at least 9 providers/facilities over the course of the waiver, providing more locations for patients to receive the specialty care they need

c) Implement transparent, standardized referral processes across the system: we already have a standard referral form and process which is documented in the EHR and is visible by staff but will work to improve tracking, reporting and collection of the referral data

d) Conduct quality improvement for project using methods such as rapid cycle improvement: we will engage in 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to integrate the specialist into the care team as much as possible.

The selected milestones and metrics focus on improvement of coordinating the care for patients to receive specialty care and more of it. The Region has demonstrated a need to improve access to specialty care and fulfill some of the gaps that have been identified in the care that is unavailable. Our metrics and milestones are structured as such and the specialties identified will be a priority as the project progresses and more facilities/providers are contracted with to provide these services. The other metrics focus on increasing the number of appropriate referrals which entails identifying patients early on when certain minor procedures can be completed in lieu of the more expensive alternatives. Lastly, we have set specific metrics around the number of patients to be served in order to ensure that on top of referrals, actual patient lives are impacted and specialty care is delivered to these individuals.

Unique community needs identification number the project addresses

CN.3- Healthcare Capacity , CN.9- Specialty Care

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any source of federal funding and has been identified as a significant Regional need. It enhances the existing delivery system reform initiative by coordinating specialty care through a primary care setting; thus managing utilization, costs and reducing complications for patients. This project would supply the specialty care needs identified by the Region and individual providers but also ensures that utilization is controlled.

Related Category 3 Outcome Measures

Based on our projected ability to contract with certain specialists available in the area, we have chosen outcome measures below that will be addressed upon establishing relationships with the specialties mentioned below.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone measure). We will measure improvement in Asthma for Baylor Clinic patients. Asthma affects about 19.6% of the Dallas County population and was identified as one of the top five conditions for cause of ED visits in the Region. Approximately 90.1% of these ED visits related to Asthma could have been handled in the outpatient setting. [71] At Baylor Health Care System, we have a standard set of Asthma metrics which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate The Percent of Opportunity Achieved (POA). This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of

[71] RHP 9 Community Health Needs Assessment

patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period. For an illustrative example: For Asthma- there are 4 opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Outcome Measure #2: IT-12.2 Cervical Cancer Screening (Non-Standalone Measure). In Dallas County, the incidence rate of cervical cancer is higher than the national average. In Dallas, the incidence rate of cervical cancer is 9.7 cases per 100,000 people[72]. According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women[73]. There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings/education not be available in a PCP/PCMH setting.

Outcome Measure #3: IT-12.3 Colorectal cancer screening (Non-Standalone Measure). In Dallas County the incidence rate of colorectal cancer is 43.3 cases per 100,000. Only 60% of the population in Dallas County has regular colon screenings. It is the second leading cause of cancer related deaths in the US and as many as 60% of the deaths from colorectal cancer could be avoided with regular screening tests.[74] According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts[75]. There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Relationship to other Projects

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Increasing access to specialty care is related to the project of expanding primary care capacity for two reasons: 1) as more patients enter the PCMH, there will be an increase in the need for specialty care services and 2) primary care is essential to coordinate the specialty care and to

[72] Healthy People North Texas: http://www.healthyntexas.org

[75] Centers for Disease Control and Prevention: http://www.cdc.gov/

allow for adequate follow-up for the patient, in order to avoid any complications or issues that may arise after the specialty care is received

Related Category 4 Population-focused improvements

While complications and failures that occur in the hospital cannot be avoided through just providing specialty care, many of the post-operative and minor procedures can be handled in the outpatient setting. Some of the inpatient specialty care proposed to be provided under this project would directly be tied to some of the Category 4 metrics.
RD-1.1, RD-1.4,RD-2.1, RD-2.4, RD-2.5, RD.2.7,RD-3.1, RD-3.3, RD-3.4, RD-3.5, RD-3.7, RD-3.8, RD-3.10, RD-3.11, RD-3.13, RD-3.14, RD-3.15, RD-3.16, RD-3.20, RD-3.21, RD-3.22, RD-3.27, RD-3.37, RD-3.38, RD-3.40, RD-3.41, RD-3.44, RD-3.45, RD-3.36, RD-3.48, RD-3.51, RD-3.52, RD-3.53,RD-4.1, RD-4.2

Relationship to Other Projects

In addition to Baylor Medical Center at Garland, projects to expand specialty care include:

- Baylor Medical Center at Carrollton (Trinity): 195018001.1.2
- Baylor Medical Center at Irving: 121776204.1.2
- Baylor University Medical Center: 139485012.1.2

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

- Parkland Health & Hospital Center – 127295703.1.5
- UT Southwestern – Faculty Practice Plan – 126686802.1.5

Our project does not serve the same specialty care population as the aforementioned projects.

Plan for Learning Collaborative.
We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. *Baylor Medical Center at Garland* has computed the value of this project using the model developed at

the Regional level. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Garland defined the population that will be directly impacted by the project as underserved individuals in the Garland and Dallas County area that need access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, patients will receive the procedures, diagnostics, etc. that they previously were unable to afford or could not have access to. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a *3* .We believe this to be the correct number because, fewer clinical exacerbations lead to less frequency of costly procedures and surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.1.2 - Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

Unique Project ID: 121776204.1.1
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will implement increased access to two Patient-Centered Medical Home (PCMH) clinics designed to provide comprehensive and high-quality primary care services to underserved patients in the Baylor Medical Center at Irving service area. The project is an expansion of Baylor's Clinic strategy in Irving and Dallas County. Historically, Baylor's Community Care clinics have provided access to patients following discharge from Baylor Medical Center at Irving. This expansion will focus on the recruitment of more underserved (Medicaid/Uninsured) patients from the community at-large and patients awaiting access to other public resources.

Need for the project: Access to quality primary care services has been demonstrated to improve health outcomes and reduce avoidable hospital utilization among underserved patient populations.This project will increase access to a PCMH for more patients in the community.

Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH. Clinic capacity will allow approximately 600 new patients/year to receive services. We expect that 90-95% of the new patients/year will be uninsured/Medicaid patients.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 1,800 new patients from the Irving community.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period. All baselines will be reevaluated and reestablished in DY2

- IT-1.7: Controlling High Blood Pressure. Our goal is to increase the number of patients with controlled blood pressure (< 140/80 mmHg) from 71.4% currently to 75.5% in DY5 (or a total of 4.1% improvement over baseline).

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (clinic wait times). Our goal is to increase patient satisfaction from 82.3% currently to 84.8% in DY5 (or a total of 2.5% improvement over baseline).

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (timely response to patient phone calls). Our goal is to increase patient satisfaction from 88.0% currently to 89.7% in DY5 (or a total of 1.7% improvement over baseline).

- IT-12.1: Breast Cancer Screening. Our goal is to increase the number of appropriate women who receive breast cancer screenings from 42.5% currently to 50.7% in DY5 (or a total of 8.2% improvement over baseline)

- IT-12.5: Other USPSTF screening outcome (Influenza Vaccination). Our goal is to increase the number of adults 18 and over who receive an influenza vaccination from 60.3% currently to 66.0% in DY5 (or a total of 5.7% improvement over baseline).

Project Description

The Baylor Clinic on the Baylor Medical Center at Irving campus, would expand their current capacity by opening their patient panels to non-Baylor patients (including Medicaid and Uninsured) and fully utilize the space and providers' capacity. Additional support staff will be hired to better coordinate patient care, ensure transition from the hospital to a Baylor Clinic and help to facilitate the care of the complex underserved patients. The Baylor Clinic on the Baylor Medical Center at Irving is already an NCQA recognized PCMH, thus the focus of this project would be to open the current panel to the underserved community and provide volume relief for other providers/ health systems in the area. We expect that approximately 90-95% of new patients will be Medicaid/Uninsured. Additionally, the clinic would provide these high quality primary care services to a greater number of people. Essentially, through expanding the capacity of the current clinic, adding additional support staff and services, a patient can receive comprehensive and complete services in one primary care location. In addition to receiving primary care, this project also proposes that ancillary services such as labs, imaging (i.e. CT scans, MRI, ultrasound, etc.) and diagnostics (i.e. colonoscopy, stress tests, etc.) would also be provided upon physician request. This project aims to close the loop of care and increase patient compliance by co-locating/coordinating many of the essential services that the underserved population often has issues accessing and completing.

Goals and Relationship to Regional Goals

The 5 year goals of this project are: (1) to provide a PCMH and PCP to a greater number of the Irving area underserved population, (2) provide continuity and transition to post-acute care services, (3) improve patients' health outcomes and status (4) create an integrated primary care model for underserved patients in Dallas County (Irving) to receive high quality, complete care keeping these patients from utilizing the emergency department for low acuity needs and preventing re(admissions) that could have been avoided with proper primary care. The Region has a primary care provider and capacity issue for the underserved population. This project aims to increase primary care access and provide high quality, comprehensive care to patients in a less costly setting. By providing more patients with the primary care they need, they will not use the ED as a means to receive basic care.

Challenges

Providers and hospitals are reluctant to expand primary care capacity in charity clinics due to the inherent necessity for other downstream services, procedures, and costs associated with adding a patient with multiple, complex needs from the underserved population. Basic primary care needs are unable to be fulfilled because of the lack of funding and capacity to take more patients, thus leading to increased (re)admissions and prevalence of disease complications. Lastly, due to the transient nature of this population, it is difficult to achieve the full extent of quality and clinical outcomes associated with a Patient Centered Medical Home. This project addresses these challenges by creating a low-cost, effective, co-located and comprehensive model specifically for the underserved population.

5-year expected outcome for the performing provider and patients

At the end of 5-years, 1850 new, unduplicated patients will have received PCMH/primary care services at the Baylor Clinics on the Baylor Medical Center at Irving Campus. We expect that at least 15% of patients who continue to come to the Baylor Clinics will achieve better Adult Preventive Scores (APS) and have overall better clinical outcomes.

Starting point/baseline

From July 2010 to June 2011 the Baylor Clinics on the Baylor Medical Center at Irving served over 650 unduplicated patients. To date, there has not been a formal process to take patients from the community; capacity is typically reserved for those patients that come from a Baylor Medical Center at Irving ED. In addition to patients discharged from Baylor Medical Center at Irving, our target population will focus on 1850 of the 872,000+ patients that are uninsured in Dallas County[76] and 36.1% uninsured in the Dallas-Plano-Irving area.[77] We plan on recruiting patients into our Baylor Clinics through a combination of utilizing our inpatient care navigation services and furthering relationships with community partners. Currently, we have Care Navigators which proactively identify potential hospital patients that would be candidates to be seen in a Baylor Clinic. Also, through the creation of project 121776204.2.3 (navigation services for high risk patients), will provide additional patients to be seen at the Baylor Clinic. Lastly, our relationship with other providers and community partners will also serve as a referral source into the clinic.

Rationale

We chose this project option because of the demonstrated need in the RHP and to leverage our PCP/PCMH model to patients outside of the Baylor system. According to the Community Health Needs Assessment, 100% of the counties in the region are designated as medically underserved areas and 36.1% of individuals in Dallas County are uninsured[78]. The combination of these two factors leads to increased ED utilization and clinical complications due to lack of adequate

[76] http://quickfacts.census.gov/qfd/states/48/48439.html
[77] Healthy North Texas: http://www.healthyntexas.org
[78] RHP 9 Community Health Needs Assessment

access to coordinated, primary care services. According to the Dallas Fort Worth Hospital Council database, 68% of ED visits related to the top conditions in the county was non-emergent/primary care treatable. The top five conditions from the ED that resulted in an inpatient admission were: stroke, diabetes, congestive heart failure, weak/failing kidneys, chronic bronchitis and heart attack. These services can be better managed in a primary care setting, ensuring 1) the patient receives needed care, 2) adequate follow-up is provided after services are accessed and 3) services are provided in a timely fashion so that long term disease complication are avoided. Baylor Clinics have a proven track record for improving patient outcomes and creating primary care capacity in underserved areas. By leveraging this model and expertise through expanding these services to beyond Baylor patients would be a service to the community and improve health outcomes for patients and other performing providers. This project is a low-cost, high-quality solution to a pressing need in the community.

Project Components

a) *Expand primary care clinic space:* We will not be physically expanding the primary care clinic space, but we will be more fully utilizing the current space we have and will take advantage of underutilized space in the Baylor Clinic to see more patients. By carving out space to handle non-clinical needs such as finding community resources, education, coordinating care/appointments, etc., this will allow more room for providers to see patients and handle clinical needs.

b) *Expand primary care clinic hours:* We plan to expand our hours through the expansion of care teams. By adding (or modifying current roles of) mid-levels and other non-physician support staff, there will be more provider hours available, more appointment availability through expanding our current capacity from two appointment slots an hour to four (for example).

c) *Expand primary care clinic staffing*. We plan on hiring at least 2 FTEs to add to the care team in Irving in order to increase our capacity and services offered. We also plan to make the current staff hours more efficient so that more appointments per hour can be offered to patients.

The Baylor Clinics at Baylor Medical Center at Irving are NCQA recognized[79], thus the focus of the metrics is on further improving and refining the PCMH baseline that has been established. Improvement metrics that hone in on increasing capacity, patient satisfaction and serving more patients are the impetus of this project. We also plan on engaging in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project-depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness.

Unique community needs identification number the project addresses

CN.3- Healthcare Capacity, CN.12-ED Usage and Readmissions

[79] NCQA: http://www.ncqa.org

Describe how the project significantly enhances an existing delivery system reform initiative
This project has not received any funding from any federal source. It enhances current delivery system reform initiative by focusing on providing high quality, low cost and comprehensive services to the underserved population. It encourages decreased utilization of unnecessary specialty care, ED utilization and promotes better preventive services to avoid downstream complications and costs. It exemplifies the Triple Aim from the Institute of Healthcare Improvement's three components of better care, better health and lower cost.

Related Category 3 Outcome Measures
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients got a PCMH at a Baylor Clinic.

Outcome Measure #1: IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone measure). Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED admissions[80]. A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population,[81] who make up 22.5% of the RHP 9 population[82] and 12.3% of the Irving population.[83] Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education about their illness in this clinic PCMH setting.

Outcome Measure #2, #3: IT-6.1 Percent Improvement over baseline of patient satisfaction scores (Standalone measure). Outcome Measure #2 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times.* Outcome Measure #3 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls.* Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007[84] has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of

visits and wait times for the overall practice. Baylor Clinics have shown high performance in all measures related to patient satisfaction, however there is opportunity for improvement.

The following two outcome measures focus on adult preventive services. Adult Preventive services as recommended by USPSTF are low cost, highly effective interventions that prevent and maintain patients' health status.

Outcome Measure #4: IT-12.1 Breast Cancer Screening (Non-Standalone Measure). In Dallas County, 23.7/100,000 women die from breast cancer with the rate in African American at 37/100,000. This statistic is considered to be higher than the national average. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.[85]

Outcome Measure #5: IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate). In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months.[86] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Relationship to other Projects

121776204.2.1 Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program: The Chronic Care Management project is related because the services will be co-located and integrated to ensure that high risk patients with chronic disease would be identified, addressed and managed.

PASS2 - 121776204.2.4 Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs - Vulnerable Patient Network (Home Visit Program)

121776204.1.2- Improve Access to Specialty Care-Expand Specialty Care Services Improving access to specialty care is related to this project because there are services that patients need that are not available in the Baylor Clinics. Patients would receive coordinated care/referrals to these services as well as the necessary follow-up required for continuity of care in a primary care clinic setting.

121776204.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment

The project involving developing care management functions to integrate primary and behavioral health needs of individuals is related to this project of expansion of primary capacity because behavioral health will now be a co-located services and a standard part of patient care.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. *Baylor Medical Center at Irving* has computed the value of this project using the model developed at the Regional level.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as *1850 underserved patients in the Dallas area of the 872,000+ uninsured in Dallas County.* We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.To

determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe, this because the project entails providing a basic PCP/PCMH setting for underserved patients who do not have one. This alone has a large impact on the individual in being able to meet basic healthcare needs and receive the medical attention they need to sustain their health. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe this to be the correct number because, when these patients receive healthcare, they are able to manage their conditions better and in a timely manner, remain productive members of society, stay out of the ED and avoid costly clinical exacerbations.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.9.2 - Improve Access to Specialty Care-Expand Specialty Care Services

Unique Project ID: 121776204.1.2
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will increase access to needed specialty care services (i.e. outpatient visits with specialty physicians, hospital-based procedures) for uninsured patients under the care of a Baylor clinics in Irving. This is a new project and will provide access to specialty services previously unattainable for Medicaid/Uninsured patients

Need for the project: Specialty services are a key element to providing a full continuum of care to patients (beyond what can be provided in a primary care clinic) and an important contributor to improved health outcomes and avoidance of costly clinical exacerbations. Shortage of specialty care was one of the key health needs identified in the RHP.

Target population: The target population will be a subset of established Baylor clinic patients who require specialty services. While historical data suggests 10-15% of all established patients will develop a need for specialty services, constraints in available specialists and facilities should allow the project to serve approximately 5% of all established patients within a given year. Baylor Clinic patients are typically 90-95% Uninsured/Medicaid. We expect that about 95% of the patients we see in the Specialty Care program will be Uninsured/Medicaid patients.

Category 1 or 2 expected patient benefits: Over the course of DY2-DY5 an estimated 261 individual patients will be connected to specialty care services. This project will make the specialist part of the primary care team. Patients will receive better coordinated and timely care.

Category 3 outcomes: The Category 3 outcomes for this project were chosen because: 1) historical data from similar programs with specialists and 2) outcomes that have potential to show material improvement over a 2-3 year time period. All baselines will be reevaluated and reestablished in DY2

- IT-11.1: Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Bundle. Our goal is to improve performance of our Asthma metrics Percent of Opportunities Achieved (POA) from 18.8% completed opportunities currently to 30.4% (or 11.2% total improvement over baseline) completed opportunities in DY5.

- IT-12.2: Cervical Cancer Screening. Our goal is to increase the number of appropriate women receive screenings from 72.2% currently to 76.2% (or 4% total improvement over baseline) in DY5.

- IT-12.3: Colorectal Cancer Screening. Our goal is to increase the percentage of appropriate patients receive screenings from 39.7% currently to 48.3% (or 8.6% total improvement over baseline) in DY5.

Project Description

Patients (including Medicaid and Uninsured) who are seen at a Baylor Clinic and have an established PCMH there, can receive the following specialty care services: certain outpatient procedures such as: office visits with specialists, wound care, and facility based procedures such as cardiac catheterizations, certain surgeries (i.e.: gall bladder/hernia), excision of masses (breast, lymphoma), and cataract removal. This project excludes transplants, oncology and perinatal services. The specialty care referral and coordination would come from the PCMH clinic per request by the patient's PCP. Baylor Clinic patients are typically 90-95% Uninsured/Medicaid. We expect that about 95% of the patients we see in the Specialty Care program will be Uninsured/Medicaid patients. Much of the value comes from building relationships, contracts and a network with local specialty care providers that can be easily accessible to this population. For Baylor Medical Center at Irving, one of the goals we have included in the project was to contract with providers in the community to create this specialty care network for the underserved population. Another facet of the project includes trying to make the specialist part of the primary care team. Through utilizing our electronic health record and specialty care referral coordinator, we hope engage specialists that provide procedures to also participate in the screening and educational needs of these patients. This is why we included Category 3 outcomes around Asthma improvement, Cervical and Colorectal cancer screening. We believe engaging specialists in these types of preventive services will help to integrate them into the primary care team. Sharing feedback through the electronic health record also will help to create a central repository of patient information and allow the care team to track and improve patient outcomes. Lastly, we expect value to come avoiding ED visits and more serious specialty care needs due to clinical exacerbations from not receiving timely and effective care.

Goals and Relationship to Regional Goals

The goals for this project are to 1) increase/improve access to specialty care services in the Irving area, 2) engage a greater number of providers/facilities to provide these services, 3) increase the number of completed specialty referrals for patients and 4) improve disease specific clinical outcomes affected by increased access to target specialists. As a result, we expect that more patients will have a better quality of life when they are given the appropriate specialty care, in a timely manner and in the appropriate venue. By managing the patient and coordinating the care through the Baylor Irving PCMH, we expect the patient will have fewer complications post procedure. According to the Community Health Needs Assessment, the

demand for primary and specialty care services exceeds that of available physicians, thus limiting healthcare access for many low level management or specialized treatments for health conditions[87]. This project would help to offset some of the demand for specialty care services and do so in a coordinated and meaningful way. The patients who need specialty care services, both inpatient and outpatient, would require a referral from their Baylor Clinic PCMH in order to receive the procedure and then also be able to follow-up with their PCP after the procedure/test is completed. This synchronizes with the regional needs of providing access to more specialty care and also coordinates the care for the patient to ensure compliance timely care. As patients receive the specialty care they need, it is likely that clinical exacerbations of manageable conditions will decrease, lowering the cost of care in more expensive settings.

Challenges

The major challenges with providing increased access to specialty care are multiple: 1) lack of supply of specialty providers in the Region and even smaller supply who are willing to provide specialty care services to this population, 2) specialty care is expensive to provide for patients who have little or no ability to pay, 3) long wait lists to receive specialty care lead to clinical exacerbations due to less timely care and 4) no coordination or follow-up for patients who do receive specialty care leading to infections, healing issues and lack of wound management which can often lead to a hospital (re)admission. Through developing community relationships with providers and facilities in the area, we plan to find ways to provide more access points in a timely manner so that we are can monitor utilization and outcomes to be good stewards of the limited specialty care resources available in the Region.

5-year expected outcome for the performing provider and patients

The 5 year expected outcome of increasing access to specialty care is to provide specialty care to approximately 261 unduplicated patients over the waiver period through increasing the number of providers/facilities contracted to at least 9 in the Irving area. We also expect to increase the number of completed referrals for specialty care services by 20% over baseline. Lastly, we expect to help facilitate the coordination and collaboration of specialists and primary care providers for our patients. We hope that by engaging specialists to do more complex procedures as well as preventive services that this will help create a more robust care team that will benefit the entire community.

Starting point/baseline

Currently, a small number of specialty referrals have been coordinated on a case-by-case basis with a limited network of specialty care providers and Baylor Medical Center at Irving. The baseline, therefore has not been closely tracked. A major focus of this project will be to more accurately capture baseline data and formalize the specialty care referral process. Historic data on specialty care demand amongst Baylor Clinic patients suggests that 10-15% of all patients develop a need for specialty care services at some point in their care. The constraints of limited specialty care providers and facilities willing to care for this population have allowed similar programs in the area to meet demand for approximately 5% of a clinic's patient population.

[87] RHP 9 Community Health Needs Assessment

Baylor Clinic patients are typically 90-95% Uninsured/Medicaid. We expect that about 95% of the patients we see in the Specialty Care program will be Uninsured/Medicaid patients.

Rationale

A key strategy for the Baylor Clinics has been the expansion of primary care access for the underserved population. Increased access to primary care has been strongly correlated with better health outcomes and lower avoidable hospital utilization within this patient population. While primary care providers are able to manage and treat many conditions, historic experience suggests that 10-15% of a clinic's patient population will likely develop a specialty care need at some point. Left untreated, this 10-15% of patients is likely to develop further exacerbation of health problems, experience more complications and increase the likelihood of avoidable hospital utilization. We chose this project option to supplement our goals of engaging specialty care physicians in providing the more complex and advanced procedures/screenings but also to conduct some basic preventive screenings and education for the patient. We feel that this will make specialists a formal part of the overall care team. Baylor Clinics have established relationships with providers in the community and as we grow, we plan to leverage and expand those relationships in order to serve more of our patients. As Baylor Clinics take on more patients from the community, we anticipate that there will be an increased need for specialty care services in this population. This project proactively creates increased specialty access for these new patients as well established clinic patients who have historically had poor access to specialty care.

Project Components

We plan on completing all required project components for the expansion of specialty care:

a) Increase service availability with extended hours: we will increase service availability by offering more appointments to patients in the outpatient setting and coordinate with surrounding hospitals to provide the inpatient services the patient may need

b) Increase number of specialty clinic locations: we plan to contract with at least 9 providers/facilities over the course of the waiver, providing more locations for patients to receive the specialty care they need

c) Implement transparent, standardized referral processes across system: we have a standard referral form and process, documented in the patient EHR and visible to staff and will work to improve tracking, reporting and collection of referral data

d) Conduct quality improvement for project using methods such as rapid cycle improvement: we will engage in 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on

available resources and financial constraints, 3) find ways to integrate the specialist into the care team as much as possible.

The chosen milestones and metrics focus on coordinating care for patients to receive specialty care and more of it. The Region has demonstrated a need to improve access to specialty care and fill some of the identified care gaps. Our metrics and milestones are structured as such and the specialties identified will be a priority as the project progresses and more facilities/providers are contracted with to provide these services. The other metrics focus on increasing the number of appropriate referrals which entails identifying patients early on when certain minor procedures can be completed in lieu of the more expensive alternatives. Lastly, we have set specific metrics around the number of patients that will be served in order to ensure that on top of referrals, actual patient lives are impacted and specialty care is delivered.

Unique community need identification number the project addresses

CN.3- Healthcare Capacity, CN.9- Specialty Care

Describe how the project significantly enhances an existing delivery system reform initiative

This project does not receive any source of federal funding and has been identified as a significant Regional need. It enhances the existing delivery system reform initiative by coordinating specialty care through a primary care setting; thus managing utilization, costs and reducing complications for patients. This project would supply the specialty care needs identified by the Region and individual providers but also ensures that utilization is controlled.

Related Category 3 Outcome Measures

Based on our projected ability to contract with certain specialists available in the area, we have chosen outcome measures below:

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone measure). Asthma affects about 19.6% of the Dallas County population and was identified as one of the top five conditions for cause of ED visits in the Region. We plan on measuring the improvement in Asthma for Baylor Clinic patients. At Baylor Health Care System, we have a standard set of Asthma metrics which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate what we call: The Percent of Opportunity Achieved (POA). This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period. For an illustrative example: For

Asthma- there are 4 opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Outcome Measure #2: IT-12.2 Cervical Cancer Screening (Non-Standalone Measure). In Dallas County, the incidence rate of cervical cancer is higher than the national average. In Dallas, the incidence rate of cervical cancer is 9.7 cases per 100,000 people[88]. According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women[89]. There is opportunity to increase screenings in the minority population through engaging OB/GYNs to provide screenings and education. Additionally, these specialists can provide advanced screenings and education that would not be available in a PCP/PCMH setting.

Outcome Measure #3: IT-12.3 Colorectal cancer screening (Non-Standalone Measure). In Dallas County the incidence rate of colorectal cancer is 43.3 cases per 100,000. Only 60% of the population in Dallas County has regular colon screenings. It is the second leading cause of cancer related deaths in the US and as many as 60% of the deaths from colorectal cancer could be avoided with regular screening tests.[90] There is a definite need for these services in Dallas County and the Baylor Clinic plans to provide these screenings to a greater number of people. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts[91]. There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Relationship to other Projects

121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Increasing access to specialty care is related to the project of expanding primary care capacity for two reasons: 1) as more patients enter the PCMH, there will be an increase in the need for specialty care services and 2) primary care is essential to coordinate the specialty care and to allow for adequate follow-up for the patient, in order to avoid any complications or issues that may arise after the specialty care is received

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

- Parkland Health & Hospital Center – 127295703.1.5
- UT Southwestern – Faculty Practice Plan – 126686802.1.5

Our project does not serve the same specialty care population as the aforementioned projects.

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor Medical Center at Irving has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as underserved individuals in the Irving and Dallas County area that access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, patients will receive the procedures, diagnostics, etc. that they previously

were unable to afford or could not have access to. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this to be the correct number because, fewer clinical exacerbations lead to less frequency of costly procedures and surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.1.2 - Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

Unique Project ID: 139485012.1.1
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas is a nationally recognized hospital that cares for more than 300,000 people each year. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will implement increased access to three (3) Patient-Centered Medical Home (PCMH) clinics designed to provide comprehensive and high-quality primary care services to underserved patients in the Baylor University Medical Center service area. The project is an expansion of Baylor's Clinic strategy in Dallas County. Historically, Baylor's Community Care clinics have provided access to patients following discharge from Baylor University Medical Center. This expansion will focus on the recruitment of more underserved (Medicaid/Uninsured) patients from the community at-large and patients awaiting access to other public resources.

Need for the project: Access to quality primary care services has been demonstrated to improve health outcomes and reduce avoidable hospital utilization among underserved patient populations.This project will increase access to a PCMH for more patients in the community.

Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH. Clinic capacity will allow approximately 1600 new patients per year. We expect that about 90-95% of the new patients/year will be uninsured/Medicaid patients.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 4,800 new patients from the Dallas community.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period. All baselines will be reevaluated and reestablished in DY2.

- IT-1.7: Controlling High Blood Pressure. Our goal is to increase the number of patients with controlled blood pressure (< 140/80 mmHg) from 52.2% currently to 59.0% in DY5 (or a total of 7% improvement over established baseline).
- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (clinic wait times). Our goal is to increase patient satisfaction from 83.8% currently to 86.1% in DY5 (or a total of 2.3% improvement over established baseline).

- IT-6.1: Percent Improvement over baseline of patient satisfaction scores (timely response to patient phone calls). Our goal is to increase patient satisfaction from 85.2% currently to 87.3% in DY5 (or a total of 2.1% improvement over established baseline).

- IT-12.1: Breast Cancer Screening. Our goal is to increase the number of appropriate women who receive breast cancer screenings from 58.7% currently to 64.6% in DY5 (or a total of 5.9% improvement over established baseline).

- IT-12.5: Other USPSTF screening outcome (Influenza Vaccination). Our goal is to increase the number of adults 18 and over who receive an influenza vaccination from 52.5% currently to 59.3% in DY5 (or a total of 6.8% improvement over established baseline)

Project Description

The Baylor Clinic on the Baylor University Medical Center campus, would expand their current capacity by opening their patient panels to non-Baylor patients (including Medicaid and Uninsured) and fully utilize the space and providers' capacity. Additional support staff will be hired to better coordinate patient care, ensure transition from the hospital to a Baylor Clinic and help to facilitate the care of the complex underserved patients. The Baylor Clinic on the Baylor University Medical Center is already an NCQA recognized PCMH, thus the focus of this project would be to open the current panel to the underserved community and provide volume relief for other providers/ health systems in the area. We expect that approximately 90-95% of new patients will be Medicaid/Uninsured. Additionally, the clinic would provide these high quality primary care services to a greater number of people. Essentially, through expanding the capacity of the current clinic, adding additional support staff and services, a patient can receive comprehensive and complete services in one primary care location. In addition to receiving primary care, this project also proposes that ancillary services such as labs, imaging (i.e. CT scans, MRI, ultrasound, etc.) and diagnostics (i.e. colonoscopy, stress tests, etc.) would also be provided upon physician request. This project aims to close the loop of care and increase patient compliance by co-locating/coordinating many of the essential services that the underserved population often has issues accessing and completing.

Goals and Relationship to Regional Goals

The 5 year goals of this project are: (1) to provide a PCMH and PCP to a greater number of the underserved population, (2) provide continuity and transition to post-acute care services, (3) improve patients' health outcomes and status (4) create an integrated primary care model for underserved patients in Dallas County to receive high quality, complete care keeping these patients from utilizing the emergency department for low acuity needs and preventing re(admissions) that could have been avoided with proper primary care. The Region has a primary care provider and capacity issue for the underserved population. This project aims to address increasing access to primary care and providing high quality, comprehensive care to patients in a less costly setting. ED utilization is high in RHP 9 and increasing primary care access will keep them from using the ED as a means to receive basic care.

Challenges

Providers and hospitals are reluctant to expand primary care capacity in charity clinics due to the inherent necessity for other downstream services, procedures, and costs associated with adding a patient with multiple, complex needs from the underserved population. Basic primary care needs are unable to be fulfilled because of the lack of funding and capacity to take more patients, thus leading to increased (re)admissions and prevalence of disease complications. Lastly, due to the transient nature of this population, it is difficult to achieve the full extent of quality and clinical outcomes associated with a Patient Centered Medical Home. This project addresses these challenges by creating a low-cost, effective, co-located and comprehensive model specifically for the underserved population.

5-year expected outcome for the performing provider and patients

At the end of 5-years, 4800 new, unduplicated patients will have received PCMH/primary care services at the Baylor Clinics on the Baylor University Medical Center Campus. We expect that at least 15% of patients who continue to come to the Baylor Clinics will achieve better Adult Preventive Scores (APS) and have overall better clinical outcomes.

Starting Point/Baseline

From July 2010 to June 2011, the Baylor Clinics on the Baylor University Medical Center served over 1900 unduplicated patients. To date, there has not been a formal process to take patients from the community; capacity is typically reserved for those patients that come from a Baylor University Medical Center ED. In addition to patients discharged from Baylor University Medical Center, we will focus on 4800 of the 872,000+ patients that are uninsured in Dallas County.[92] We plan on recruiting patients into our Baylor Clinics through a combination of utilizing our inpatient care navigation services and furthering relationships with community partners. Currently, we have Care Navigators which proactively identify potential hospital patients that would be candidates to be seen in a Baylor Clinic. Also, through the expansion of project 139485012.2.3 (navigation services for high risk patients), will provide additional patients to be seen at the Baylor Clinic. Lastly, our relationship with other providers and community partners will also serve as a referral source into the clinic.

We chose this project option because of the demonstrated need in the RHP and to leverage our PCP/PCMH model to patients outside of the Baylor system. According to the Community Health Needs Assessment, 100% of the counties in the region are designated as medically underserved areas and 36.1% of individuals in Dallas County are uninsured.[93] The combination of these two factors leads to increased ED utilization and clinical complications due to lack of adequate access to coordinated, primary care services. According to the Dallas Fort Worth Hospital Council database, 68% of ED visits related to the top conditions in the county were non-emergent /primary care treatable. The top five conditions from the ED that resulted in an inpatient admission were: stroke, diabetes, congestive heart failure, weak/failing kidneys,

[92] Census Quick Facts: http://quickfacts.census.gov/qfd/states/48/48439.html

[93] RHP 9 Community Health Needs Assessment

chronic bronchitis and heart attack. These services can be better coordinated and managed in a primary care setting, ensuring 1) the patient receives needed care, 2) adequate follow-up is provided and 3) services are provided in timely fashion so that long term disease complications and other issues are avoided. Baylor Clinics have a proven track record for improving patient outcomes and creating primary care capacity in underserved areas. Expanding these services to non-Baylor patients would be a service to the community and patients. This project is a low-cost, high-quality solution to a pressing need in the community.

Project Components

The three main core components of this project include:

a) *Expand primary care clinic space:* We will not be physically expanding the primary care clinic space, but we will be more fully utilizing the current space we have and will take advantage of underutilized space in the Baylor Clinic to see more patients. By carving out space to handle non-clinical needs such as finding community resources, education, coordinating care/appointments, etc., this will allow more room for providers to see patients and handle clinical needs.

b) *Expand primary care clinic hours:* We plan to expand our hours through the expansion of care teams. By adding mid-levels and other non-physician support staff, there will be more provider hours available, more appointment availability through expanding our current capacity from two appointment slots an hour to four (for example).

c) *Expand primary care clinic staffing*. We plan on hiring at least 2 FTEs to add to the care team in Dallas in order to increase our capacity and services offered. We also plan to make the current staff hours more efficient so that more appointments per hour can be offered to patients.

The Baylor Clinics at Baylor University Medical Center are NCQA recognized[94], thus the focus of the metrics is on further improving and refining the PCMH baseline that has been established. Improvement metrics that hone in on increasing capacity, patient satisfaction and serving more patients are the impetus of this project. We also plan on engaging in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project-depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness.

Specify the unique community need identification number the project addresses:

CN.3- Healthcare Capacity, CN.12-ED Usage and Readmissions

How the Project significantly enhances an existing delivery system reform initiative

This project has not received any funding from any federal source. It enhances current delivery system reform initiative by focusing on providing high quality, low cost and comprehensive services to the underserved population. It encourages decreased utilization of unnecessary specialty care, ED utilization and promotes better preventive services to avoid downstream

[94] NCQA: http://www.ncqa.org

complications and costs. It exemplifies the Triple Aim from the Institute of Healthcare Improvement's three components of better care, better health and lower cost.

Related Category 3 Outcome Measures

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients got a PCMH at a Baylor Clinic.

Outcome Measure #1: IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone measure). Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED admissions.[95] A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population,[96] who make up 22.5% of the RHP 9 population. Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education about their illness in this clinic PCMH setting.

Outcome Measure #2 and #3: IT-6.1: Percent Improvement over baseline of patient satisfaction scores (Standalone measure). Outcome Measure #2 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times.* Outcome Measure #3 will measure: *Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls.* Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007[97] has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED.

[95] RHP 9 Community Health Needs Assessment

[96] http://health.nytimes.com/health/guides/disease/hypertension/complications.html

[97] Drain, M., & Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

The following two outcome measures focus on adult preventive services. Adult Preventive services as recommended by USPSTF are low cost, highly effective interventions that prevent and maintain patients' health status. Patients who are a part of a Baylor PCMH are routinely screened and monitored to ensure that they are receiving all preventive services that are appropriate for their age and condition.

Outcome Measure #4: IT-12.1 Breast Cancer Screening (Non-Standalone Measure). In Dallas County, 23.7/100,000 women die from breast cancer with the rate in African American at 37/100,000. This statistic is considered to be higher than the national average. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.[98]

Outcome Measure #5: IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate). In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months.[99] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Relationship to Other Projects

139485012.2.1 Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program: The Chronic Care Management model will be integrated to ensure that high risk patients with chronic disease would be identified, addressed and managed.

PASS 2: 139485012.2.4 Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs - Vulnerable Patient Network (Home Visit Program)

139485012.1.2- Improve Access to Specialty Care-Expand Specialty Care Services Improving access to specialty care is essential so patients can receive coordinated care/referrals to these services and necessary follow-up required for continuity of care in a primary care clinic setting.

139485012.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment

The project involving developing care management functions to integrate primary and behavioral health is related - services will be integrated and a standard part of patient care.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. The exchange of best practices and shared learning contributes significantly to CQI and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. This methodology is consistent with our approach in our other RHPs. Baylor University Medical Center has computed the value of this project using the model developed at the Regional level.

Baylor University Medical Center defined the population that will be directly impacted by the project as 4800 underserved patients in the Dallas area of the 872,000+ uninsured in Dallas County. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***4.*** We believe because this project entails providing a basic PCP/PCMH setting for underserved patients who do not have one, this alone has a large impact on the individual in being able to meet basic healthcare needs and receive the medical attention they need to sustain their health. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***4.*** We believe this is correct because, when a person is positively impacted, their dependence on community resources is better utilized and over time, will decrease. When these patients

receive healthcare, they are able to manage their conditions better, remain productive members of society, stay out of the ED and avoid costly clinical exacerbations.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.9.2 - Improve Access to Specialty Care-Expand Specialty Care Services

Unique Project ID: 139485012.1.2
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is hospital that cares for more than 300,000 people each year. It is a major patient care, teaching and research center for the Southwest. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will increase access to needed specialty care services (i.e. outpatient visits with specialty physicians, hospital-based procedures) for uninsured patients under the care of a Baylor clinics in Dallas. This is a new project and will provide specialty services previously unattainable for Medicaid/Uninsured patients.

Need for the project: Specialty services are a key element to providing a full continuum of care to patients (beyond what can be provided in a primary care clinic) and an important contributor to improved health outcomes and avoidance of costly clinical exacerbations. Shortage of specialty care was one of the key health needs identified in the RHP.

Target population: The target population will be a subset of established Baylor clinic patients who require specialty services. While historical data suggests 10-15% of all established patients will develop a need for specialty services, constraints in available specialists and facilities should allow the project to serve approximately 5% of all established patients within a given year. Baylor Clinic patients are typically 90-95% Uninsured/Medicaid. 95% of patients in this specialty care project will be Uninsured/Medicaid.

Category 1 or 2 expected patient benefits: Over the course of DY3-DY5 an estimated 400 individual patients will be connected to specialty care services. This project will make the specialist part of the primary care team.

Category 3 outcomes: The Category 3 outcomes for this project were chosen because: 1) historical data from similar programs with specialists and 2) outcomes that have potential to show material improvement over a 2-3 year time period.

- IT-11.1: Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Bundle. Our goal is to improve performance of our Asthma metrics Percent of Opportunities Achieved (POA) from 30% completed opportunities currently to 40% (or 10% improvement over baseline) completed opportunities in DY5.

- IT-12.2: Cervical Cancer Screening. Our goal is to increase the number of appropriate women receive screenings from 68.9% currently to 73.3% (or 4.4% improvement over baseline) in DY5.

- IT-12.3: Colorectal Cancer Screening. Our goal is to increase the percentage of appropriate patients receive screenings from 49% currently to 56.3% (or 7.3% improvement over baseline) in DY5.

Project Description

Patients (including Medicaid and Uninsured) who are seen at a Baylor Clinic and have an established PCMH, can receive specialty care services such as outpatient procedures, specialty office visits, wound care, and facility based procedures such as cardiac catheterizations, certain surgeries (i.e.: gall bladder/hernia), excision of masses (breast, lymphoma), and cataract removal. This project excludes transplants, oncology and perinatal services. The specialty care referral/coordination will come from the PCMH clinic per PCP's request. We expect approximately 95% of patients that will receive specialty care will be Uninsured/Medicaid. This project is more than just providing specialty care to patients. Much of the value comes from building relationships, contracts and a network with local specialty care providers that can be easily accessible to this population. For Baylor University Medical Center, one of the goals we have included in the project was to contract with at least 12 providers in the community to create this specialty care network for the underserved population. Another facet of the project includes trying to make the specialist part of the primary care team. Through utilizing our electronic health record and specialty care referral coordinator, we hope engage specialists that provide procedures to also participate in the screening and educational needs of these patients. This is why we included Category 3 outcomes around Asthma improvement, Cervical and Colorectal cancer screening. We believe engaging specialists in these types of preventive services will help to integrate them into the primary care team. Sharing feedback through the electronic health record also will help to create a central repository of patient information and allow the care team to track and improve patient outcomes. Lastly, we expect value to come avoiding ED visits and more serious specialty care needs due to clinical exacerbations from not receiving timely and effective care. Almost $74.9 million dollars in total costs were spent on inpatient visits and procedures (excluding any maternal/newborn procedures) that Medicaid/Uninsured patients received at Baylor University Medical Center at Dallas from July of 2011 to June of 2012.

Goals and Relationship to Regional Goals

The goals for this project are to 1) increase/improve access to specialty care services, 2) engage a greater number of providers/facilities to provide these services, 3) increase the number of completed specialty referrals for patients and 4) improve disease specific clinical outcomes affected by increased access to target specialists. As a result, we expect that more patients will have a better quality of life when they are given the appropriate specialty care, in a timely manner and in the appropriate venue. By managing the patient and coordinating the care

through the PCMH, we expect the patient will have fewer complications post procedure. According to the Community Health Needs Assessment, the demand for primary and specialty care services exceeds that of available physicians, thus limiting healthcare access for many low level management or specialized treatments for health conditions[100]. This project would help to offset some of the demand for specialty care services and do so in a coordinated and meaningful way. The patients who need specialty care services, both inpatient and outpatient, would require a referral from their Baylor Clinic PCMH in order to receive the procedure and then also be able to follow-up with their PCP after the procedure/test is completed. This synchronizes with regional needs of providing access to more specialty care and also coordinates the care for the patient to ensure compliance timely care. As patients receive specialty care they need, it is likely clinical exacerbations of manageable conditions will decrease, lowering the cost of care in more expensive settings.

Challenges

The major challenges with providing increased access to specialty care are multiple: 1) lack of supply of specialty providers in the Region and even smaller supply who are willing to provide specialty care services to this population, 2) specialty care is expensive to provide for patients who have little or no ability to pay, 3) long wait lists to receive specialty care lead to clinical exacerbations due to less timely care and 4) no coordination or follow-up for patients who do receive specialty care leading to infections, healing issues and lack of wound management which can often lead to a hospital (re)admission. Through developing community relationships with providers and facilities in the area, we plan to find ways to provide more access points for these patients to receive the care they need, in a timely manner so that we are can monitor utilization and outcomes and be good stewards of limited specialty care resources.

5-year expected outcome for the performing provider and patients

The 5 year expected outcome is to provide specialty care to approximately 400 unduplicated patients over the waiver period by increasing the number of providers/facilities contracted to at least 12. We also expect to increase the number of completed referrals for specialty care services 20% over baseline. Lastly, we expect to help facilitate the coordination and collaboration of specialists and primary care providers for our patients. We hope that by engaging specialists to do more complex procedures as well as preventive services that this will help create a more robust care team that will benefit the entire community.

Starting Point/Baseline

Currently, specialty referrals have been coordinated on a case-by-case basis with a limited network of specialty care providers and Baylor University Medical Center. The baseline, therefore has not been closely tracked. A major focus of this project will be to more accurately capture baseline data and formalize the specialty care referral process. Historic data on specialty care demand amongst Baylor Clinic patients suggests that 10-15% of all patients develop a need for specialty care services at some point in their care. The constraints of limited

[100] RHP 9 Community Health Needs Assessment

specialty care providers and facilities willing to care for this population have allowed similar programs in the area to meet demand for approximately 5% of a clinic's patient population.

Rationale

A key strategy for the Baylor Clinics has been the expansion of primary care access for the underserved population. Increased access to primary care has been strongly correlated with better health outcomes and lower avoidable hospital utilization within this patient population. While primary care providers are able to manage and treat many conditions, historic experience suggests that 10-15% of a clinic's patient population will likely develop a specialty care need at some point. Left untreated, this 10-15% of patients is likely to develop further exacerbation of health problems, experience more complications and increase the likelihood of avoidable hospital utilization. This project will supplement our goals of engaging specialty care physicians in providing the more advanced procedures/screenings and to conduct some basic preventive screenings and patient education. This will make specialists a formal part of the care team. Baylor Clinics have established relationships with providers in the community and as we grow, we will expand those relationships to serve more patients. As Baylor Clinics take more patients from the community, there will be an increased need for specialty care services in this population. This project proactively creates increased specialty access for these new patients as well established clinic patients who have historically had poor access to specialty care.

Project Components

We will complete all required project components for the expansion of specialty care project:

a) Increase service availability with extended hours: we will increase service availability by offering more appointments to patients in the outpatient setting and coordinate with surrounding hospitals to provide the inpatient services the patient may need

b) Increase number of specialty clinic locations: we plan to contract with at least 12 providers/facilities over the course of the waiver, providing more locations for patients to receive the specialty care they need

c) Implement transparent, standardized referral processes across the system: we have a standard referral form and process documented in the EHR and visible to staff and will work to improve tracking, reporting and collection of referral data

d) Conduct quality improvement for project using methods such as rapid cycle improvement: we will engage in 1) identifying key challenges with project expansion, 2) determine opportunities to scale all or part of the project- depending on available resources/financial constraints, 3) identify ways to integrate specialists into care team

The milestones and metrics chosen for this project really focus on improvement of coordinating the care for patients to receive specialty care and more of it. The Region has demonstrated a need to improve access to specialty care and fulfill some of the gaps that have been identified

in the care that is unavailable. Our metrics and milestones are structured as such and the specialties identified will be a priority as the project progresses and more facilities/providers are contracted with to provide these services. The other metrics focus on increasing the number of appropriate referrals which entails identifying patients early on when certain minor procedures can be completed in lieu of the more expensive alternatives. Lastly, we have set specific metrics around the number of patients that will be served in order to ensure that on top of referrals, actual patient lives are impacted and specialty care is delivered.

Unique community need identification number the project addresses
CN.3- Healthcare Capacity, CN.9- Specialty Care

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project does not receive any source of federal funding and has been identified as a significant Regional need. It enhances the existing delivery system reform initiative by coordinating specialty care through a primary care setting; thus managing utilization, costs and reducing complications for patients. This project would supply the specialty care needs identified by the Region and individual providers but also ensures that utilization is controlled.

Related Category 3 Outcome Measures
Based on our projected ability to contract with certain specialists available in the area, we have chosen outcome measures below that will be addressed upon establishing relationships with the specialties mentioned below.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone measure). We plan on measuring the improvement in Asthma for Baylor Clinic patients. Asthma affects about 19.6% of the Dallas County population and was identified as one of the top five conditions for cause of ED visits in the Region. Approximately 90.1% of these ED visits related to Asthma could have been handled in the outpatient setting. [101] At Baylor Health Care System, we have standard Asthma metrics: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate what we call: The Percent of Opportunity Achieved (POA). This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets

[101] RHP 9 Community Health Needs Assessment

for their asthma patients than in the prior reporting period. For an illustrative example: For Asthma- there are 4 opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Outcome Measure #2: IT-12.2 Cervical Cancer Screening (Non-Standalone Measure). In Dallas County, the incidence rate of cervical cancer is higher than the national average. In Dallas, the incidence rate of cervical cancer is 9.7 cases per 100,000 people.[102] According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women[103]. There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide advanced screenings/education that would not be available in a PCP/PCMH setting.

Outcome Measure #3: IT-12.3 Colorectal cancer screening (Non-Standalone Measure). In Dallas County the incidence rate of colorectal cancer is 43.3 cases per 100,000. Only 60% of the population in Dallas County has regular colon screenings. It is the second leading cause of cancer related deaths in the US and as many as 60% of the deaths from colorectal cancer could be avoided with regular screening tests.[104] There is a definite need for these services in Dallas County and the Baylor Clinic plans to provide these screenings to a greater number of people. There is greater need for patients to receive (appropriate) sigmoidoscopies/ colonoscopies in the region as a preventive measure. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts[105]. There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Relationship to other Projects

139485012.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Increasing access to specialty care is related to the project of expanding primary care capacity for two reasons: 1) as more patients enter the PCMH, there will be an increase in specialty care need and 2) primary care is essential to coordinate specialty care and allow for adequate follow-up to avoid any complications or issues that may arise after the specialty care is received

Relationship to Other Projects

In addition to Baylor University Medical Center, projects to expand specialty care include:

- Baylor Medical Center at Carrollton (Trinity)
- Baylor Medical Center at Garland
- Baylor Medical Center at Irving

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

The following providers have projects to expand specialty care access:

- Parkland Health & Hospital Center – 127295703.1.5
- UT Southwestern – Faculty Practice Plan – 126686802.1.5

Our project aims to open access to patients who could not otherwise receive the specialty care they need and will require coordination and collaboration with other performing providers in the region. Our project does not serve the same specialty care population as the aforementioned project.

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. The exchange of best practices and shared learning will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor University Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor University Medical Center defined the population that will be directly impacted by the project as underserved individuals in the Dallas and Dallas County area that access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, patients will receive the procedures, diagnostics, etc. that they previously were unable to afford or could not have access to. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this to be the correct number because, fewer clinical exacerbations lead to less frequency of costly procedures and surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 1.1.1 - Expand Pediatric Primary Care

Unique Project ID: 138910807.1.1
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Annually, Children's has approximately 600,000 patient contacts.

Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). Children's is considered the safety net hospital for pediatrics in region.

MyChildren's payor mix is 75% Medicaid, 15% CHIP, 5% Self-pay (uninsured) and 5% Commercial insurance.

Intervention: Expand the capacity of pediatric primary care in Dallas County through 16 additional Children's Medical Center (CMC) primary care centers and a medical home for children with complex chronic illness, integrated with critical support services across a continuum of care to better accommodate the needs of the pediatric population (Medicaid and CHIP), so that children receive the right care at the right time, have access to same-day appointment thereby reducing the unnecessary use of Emergency Department services. This project will also establish pediatric urgent care services on the Dallas campus and implement telemedicine to connect school settings with pediatricians.

Need for the Project: Documented in the community needs (CN) assessment, specifically: CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: Children covered by Medicaid or CHIP or are eligible for coverage who need primary care services including children with complex chronic health care needs, approximately 76,500 patients (volume DY5 + 10% attrition and new patients) and 529,100 visits. Estimated impact:

Type of volume	DY2	DY3	DY4	DY5
MyChildren's patients	21,500	35,000	51,800	69,000
MyChildren's visits	43,000	104,800	158,000	216,000
Complex chronic patients		150	300	400
Complex chronic visits		1,200	2,400	3,200
Telemedicine patients		-	100	150
Telemedicine visits		-	200	300

Total patients	21,500	35,150	52,200	69,550
Total visits	43,000	106,000	160,600	219,500

Category 1 & 2 Expected Patient Benefits: What is the project's benefit for Medicaid and Uninsured of your Service area? Children's Medical Center is the safety net hospital for children in Dallas County, providing the majority of ED, specialty and inpatient care to Medicaid and safety net patients/families. This project will increase in the number of children with all recommended well-child visits, increase in children receiving immunizations on schedule, increase in availability of same day or next day "sick" visits, reduce the inappropriate use of the emergency department and reduce overall cost of health care for children in Dallas County.

Category 3 Outcomes: OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization (Stand-alone measure). This measure was selected because the project is designed to increase the availability of primary care for children covered by Medicaid and CHIP thereby reducing inappropriate utilization of ED services and improve the health of low-income children.

This project does not include any other federal grant money.

Project Description

This project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (access to pediatric primary care).

Expand the capacity of pediatric primary care in Dallas County through sixteen additional Children's Medical Center (CMC) primary care centers and a medical home for children with complex chronic illness, integrated with critical support services across a continuum of care to better accommodate the needs of the pediatric population (Medicaid and CHIP), so that children receive the right care at the right time, have access to same-day appointments thereby reducing the unnecessary use of Emergency Department services. This project will also establish pediatric urgent care services on the Dallas campus and implement telemedicine to connect school settings with pediatricians. The additional capacity will be integrated with all other community-based providers across a continuum of care to establish a "virtual safety net" for children's health care.

Goals and Relationship to Regional Goals:

The goals of the project are to increase the availability of pediatric primary care services in Dallas County and ensure the appropriate use of such services by the population through support systems and electronic technology. Incremental increase in local pediatric primary care clinics with after-hours availability, coupled with a pediatric urgent care center and the use of telemedicine to link primary care providers with pediatric specialists will ensure both the availability and use of cost-effective, high-quality pediatric care and health advice and reduce unnecessary use of emergency department services.

This project is related to the regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

Challenges

A major challenge will be to integrate the expanded primary care capacity with the existing pediatric continuum of care in the community: other primary care providers, urgent care services community health workers, faith-based programs, free clinics, homeless shelters, school systems, not-for-profit organizations, managed care payors, health departments and other to form a "virtual safety net" in the community. This project will address these challenges by coordinating with all providers in the Dallas County, establishing a regular forum for jointly addressing challenges and incrementally establishing the policies and linkages for a "virtual safety net" for the underserved children. A second major challenge will be changing the behaviors of families who have used emergency services for low complexity care. This challenge will be addressed through the use of health literacy principles, language and culturally appropriate approaches through the use of community health workers who reside in the community and understand the customs and speak the language. Behavior changes are projected based on the reduction in inappropriate emergency department utilization in a targeted zip code after a new MyChildren's primary care office opened in that zip code. A third challenge will be recruiting sufficient numbers of staff who are bilingual and multicultural. Children's is the pediatric training site for many student healthcare training programs. Bilingual and culturally diverse students will be identified through the relationships developed the training at Children's and then recruited after the student training is completed.

Five-Year Expected Outcomes for Provider and Patients:

The five-year expected outcomes of the project include increase in the number of children with all recommended well-child visits, increase in children receiving immunizations on schedule, increase in availability of same day or next day "sick" visits, reduce the inappropriate use of the emergency department and reduce overall cost of health care for children in Dallas County. Estimated impact: approximately 76,500 patients (volume DY5 + 10% attrition and new patients) and 529,100 visits.

Type of volume	DY2	DY3	DY4	DY5
MyChildren's patients	21,500	35,000	51,800	69,000
MyChildren's visits	43,000	104,800	158,000	216,000
Complex chronic patients		150	300	400
Complex chronic visits		1,200	2,400	3,200
Telemedicine patients		-	100	150
Telemedicine visits		-	200	300
Total patients	21,500	35,150	52,200	69,550
Total visits	43,000	106,000	160,600	219,500

Starting Point/Baseline

The baseline for this project is the number of MyChildren's locations in RHP 9 and the availability of telemedicine services in school settings at the beginning of DY1.

Rationale

Children's Medical Center's (CMC) emergency department (Dallas Campus) treats approximately 50,000 Level 4 and Level 5 visits annually (36% of total emergency department visits) for children with low-acuity illnesses and acute care symptoms, which can be more cost-effectively addressed in community-based primary care clinics. The days and times for the Level 4 and Level 5 visits include both normal workday hours, evening weekday hours and weekend hours. Children's Medical Center mapped the ZIP codes where the largest percentage of the families reside with children who were presenting themselves at the CMC emergency department for Level 4 and Level 5 visits. CMC then determined which of the identified ZIP codes lacked available and accessible primary care, located suitable lease opportunities in the identified ZIP codes for CMC primary care centers.

As concluded in the Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the demand for pediatric primary care services, which are both accessible and convenient for patient families, exceeds the available capacity, thus limiting health care access for many low-level acute care management or chronic conditions. Emergency departments are treating high volumes of pediatric patients with preventable conditions or conditions that are suitable to be addressed in a primary care setting. Additionally, many pediatric primary care physicians accept a limited number of the Medicaid/CHIP/uninsured population and may have limited or no extended hours, ultimately even further restraining the capacity of many families to access important primary care services. Between 2000 and 2010, the percentage of Texas doctors accepting Medicaid patients decreased from 67% to 31%. In Dallas County, more than 68% of doctors said they would not take on children who use CHIP. Consequently, many families seek primary care treatment for their children in emergency care settings, resulting in increased health care costs and higher volumes of preventable and avoidable cases populating emergency department waiting rooms. Dallas County has significant Health Professional Shortage Areas (HPSA's) and Medically Underserved Areas (MUA's). Furthermore, in Dallas County, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment.

Approximately 500 pediatric patients at Children's Medical Center see five (5) or more pediatric specialists on a regular basis, and experience significant unnecessary utilization of emergency department inpatient and specialty care visits because of the lack of comprehensive primary care. Complex chronically ill children account for less than 5% of total patients in a pediatric population, but account for approximately 50% of the costs. Many primary care pediatricians do not feel comfortable treating children with complex chronic illnesses and therefore, refer

those children to the emergency department and pediatric specialists for virtually all of their acute care needs, unnecessarily overloading scarce pediatric emergency department services and pediatric specialty services at Children's Medical Center / UT Southwestern. Additionally, without access to comprehensive primary care, children with complex chronic illnesses lack access to appropriate preventive care services. The establishment of a medical home for children with complex chronic illness, as part of the expansion of pediatric primary care capacity in Dallas, coupled with the use of telemedicine capability, will provide children with complex chronic illness with primary care, care coordination and preventive care. This will reduce unnecessary emergency visits, unnecessary specialty visits and unnecessary readmissions.

Telemedicine services will begin with a pilot at Mi Escuelita. Mi Escuelita is a preschool system in Dallas targeting preschoolers with limited English proficiency (LEP) and living at or near the poverty level. The goal is prepare these children to be successful in school once they reach primary school age and to teach their families how to support these children to be successful in school. There are two locations in Dallas in medically underserved areas. Telemedicine will be used to connect a school nurse to pediatric primary care provider to bring pediatric primary care services to the preschool setting. After the pilot, telemedicine services will expand to public school settings.

Project Components:

Project 1.1.1 "Establish more primary care clinics" does not contain core project components.

Milestones and Metrics:

Milestones and metrics are based on relevancy to the RHP 9's pediatric population, the community needs for additional pediatric primary care, the RHP priority rating of this project in the highest priority (A) category and the baseline data of non-emergent emergency department use by children.

Community Needs (CN) Addressed:

- CN 3: Healthcare Capacity
- CN 4: Primary Care and Pediatrics
- CN 8: Chronic Disease
- CN 9: Specialty Care
- CN 11: Emergency Department Usage and Readmissions

How the Project significantly enhances an existing delivery system reform initiative:

The project will significantly enhance the current supply of pediatric primary care and lessen the burden of care in current Federally Qualified Healthcare Centers and Parkland's Community

Oriented Primary Care Centers (COPCs). This project is based on the inappropriate emergency department use by children in Dallas County.

Related Category 3 Outcome Measure and Reason for Selecting Outcomes Measure

OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization. (Stand-alone measure) This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children by significantly increasing the number of primary care providers who accept Medicaid and CHIP. Locations of the providers will be based on medically underserved areas, zip codes with high usage ED services for primary care and inadequate supply of pediatric primary care providers in the area. Telemedicine use will be piloted to determine if it is an additional methodology to bring health care services to locations where children need care.

Relationship to other projects

138910807.1.2 Expand Primary Care Hours
138910807.1.3 Implement Disease Management
138910807.1.4 Expand Pediatric Behavioral Health
138910807.2.1 Expand/Enhance Medical Homes
138910807.2.2 Implement/Enhance Evidence-based Health Promotion Programs
138910807.2.3 Expand/Enhance Patient/Family Navigation
138910807.2.4 Implement/Expand Care Transitions Program
RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-6 Initial Core Set of Health Care Quality Indicators

This project is related to the other Catgegory 1 and 2 projects proposed by Children's because four of the other projects (Expand Primary care Hours, Implement Disease Management, Expand Pediatric Behavioral Health and Expand/Enhance Medical Homes) are all focused within the MyChildren's practices. The remaining three projects support overall population health and are supportive of this project to expand the number of primary care clinics.

Relationship to Other Performing Providers' Projects in the RHP

Other projects that focus on expanding primary care are:

Performing Provider	Unique Project ID

UT Southwestern Medical Center Faculty Plan	126686802.1.2

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	8	2.00
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	8	1.20
Sustainability	15%	8	1.20
Partnership Collaboration	5%	8	0.40
	100%		8.40

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

No other federal grant dollars are being used for this project.

Metric: Documentation of increased number of providers and staff and/or clinic sites. a. Data Source: Documentation of completion of all items described by the RHP plan for this measure. Hospital or other Performing Provider report, policy, contract or other documentation b. Rationale: Additional staff members and providers may be necessary to increase capacity to deliver care. C. Goal: 25 number of new staff with training completed by 9/30/13 Milestone 2 Estimated Incentive Payment *(maximum amount):* $1,687,860	Milestone 4 (P-5): Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers P-5.1. Metric: Documentation of increased number of providers and staff and/or clinic sites. a. Data Source: Documentation of completion of all items described by the RHP plan for this measure. Hospital or other Performing Provider report, policy, contract or other documentation b. Rationale: Additional staff members and providers may be necessary to increase capacity to deliver care. C. Goal: 15 new staff with training completed by 9/30/14 Milestone 4 Estimated Incentive Payment *(maximum amount):* $ 1,726,279		
Year 2 Estimated Milestone Bundle Amount $3,375,720	Year 3 Estimated Milestone Bundle Amount: $3,452,558	Year 4 Estimated Milestone Bundle Amount: $3,447,206	Year 5 Estimated Milestone Bundle Amount: $2,783,458
TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add milestone bundle amounts over Years 2-5):* $13,058,942			

Project Option 1.1.2 - Expand Pediatric Primary Care Hours

Unique Project ID: 138910807.1.2
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Size of provider system and service area: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP.

Provider's role in region's health care infrastructure: Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured).

MyChildren's payor mix is 75% Medicaid, 15% CHIP, 5% Uninsured and 5% Commercial insurance.

Intervention: The purpose of this project is to expand the hours of operation to include nights and weekends at the MyChildren's locations and to establish a 24 hour RN triage telephone service. It is an expansion of an existing initiative.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: Children covered by Medicaid, CHIP or uninsured: approximately 86,000 patients (95% of total patients)

Intervention	DY2	DY3	DY4	DY5
Patients on panel	39,000	50,600	71,000	90,500
Extended hours visits	1,800	12,000	23,000	29,000
RN triage calls	7,000	10,500	15,000	20,000

Category 1 & 2 Expected Benefit: Provide access to primary care in the appropriate setting on nights and weekends.

Category 3 Outcome: OD-9 Preventive and Primary Care. IT-3.9.2 ED appropriate utilization. (Stand alone measure) This measure was selected because the project is designed to support appropriate utilization of ED services and reduce the inappropriate use of ED services.

The project will not use additional federal grant dollars.

Project Description

This project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (inadequate access to pediatric primary care).

Expand the capacity of pediatric primary care in Dallas County through (B) expanding primary clinic hours and (C) expanding primary care clinic staffing to better accommodate the needs of the pediatric population (Medicaid and CHIP), so that children receive the right care at the right time; have access to same-day appointment thereby reducing the unnecessary use of Emergency Department services. No additional primary care clinic space (component A) is anticipated as additional capacity can be achieved in the current space by increasing hours open and adding staff. This project will also establish a 24/7 pediatric nurse/physician advice line and outreach call capability. The additional capacity will be integrated with all other community-based providers across a continuum of care to establish a "virtual safety net" for children's health care.

Goals and Relationship to Regional Goals:

The goals of the project are to increase the availability of pediatric primary care services in Dallas County and ensure the appropriate use of such services by the population through support systems and electronic technology. Incremental increase in local pediatric primary care clinics with after-hours availability, coupled with a 24/7 pediatric nurse/physician advice line and outreach call capability will ensure both the availability and use of cost-effective, high-quality pediatric care and health advice and reduce unnecessary use of emergency department services.

This project is related to the regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

Challenges

A major challenge will be to integrate the expanded primary care capacity with the existing pediatric continuum of care in the community: other primary care providers, urgent care services community health workers, faith-based programs, free clinics, homeless shelters, school systems, not-for-profit organizations, 24/7 pediatric call center, managed care payors, health departments and other to form a "virtual safety net" in the community. This project will address these challenges by coordinating with all providers in the Dallas County, establishing a regular forum for jointly addressing challenges and incrementally establishing the policies and linkages for a "virtual safety net" for the underserved children. A second major challenge will be changing the behaviors of families who have used emergency services for low complexity care. This challenge will be addressed through the use of health literacy principles, language

and culturally appropriate approaches the through the use of community health workers who reside in the community and understand the customs and speak the language. Behavior changes are projected based on the reduction in inappropriate emergency department utilization in a targeted zip code after a new MyChildren's primary care office opened in that zip code. A third challenge will be recruiting sufficient numbers of staff who are bilingual and multicultural. Children's is the pediatric training site for many student healthcare training programs. Bilingual and culturally diverse students will be identified through the relationships developed the training at Children's and then recruited after the student training is completed.

Five-year Expected Outcomes for Provider and Patient:

The five-year expected outcomes of the project include increase in the number of children with all recommended well-child visits, increase in children receiving immunizations on schedule, increase in availability of same day or next day "sick" visits, reduction in the inappropriate emergency department use and reduction in overall cost of health care for children in Dallas County.

Starting point/baseline

The baseline for this project is the hours of operations of MyChildren's locations in Dallas County at the beginning on DY1.

Rationale

Children's Medical Center's (CMC) emergency department (Dallas Campus) treats approximately 50,000 Level 4 and Level 5 visits annually (36% of total emergency department visits) for children with low-acuity illnesses and acute care symptoms, which can be addressed in more cost-effective manner in community-based primary care clinics. The days and times for the Level 4 and Level 5 visits include both normal workday hours, evening weekday hours and weekend hours. Children's Medical Center mapped the ZIP codes where the largest percentage of the families reside with children who were presenting themselves at the CMC emergency department for Level 4 and Level 5 visits. CMC then determined which of the identified ZIP codes lacked available and accessible primary care, located suitable lease opportunities in the identified ZIP codes for CMC primary care centers.

As concluded in the Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the demand for pediatric primary care services, which are both accessible and convenient for patient families, exceeds the available capacity, thus limiting health care access for many low-level acute care management or chronic conditions. Emergency departments are treating high volumes of pediatric patients with preventable conditions or conditions that are suitable to be addressed in a primary care setting. Additionally, many pediatric primary care physicians accept a limited number of the Medicaid/CHIP/uninsured population and may have limited or no extended hours, ultimately even further restraining the capacity of many families to access important primary care

services. Between 2000 and 2010, the percentage of Texas doctors accepting Medicaid patients decreased from 67% to 31%. In Dallas County, more than 68% of doctors said they would not take on children who use CHIP. Consequently, many families seek primary care treatment for their children in emergency care settings, resulting in increased health care costs and higher volumes of preventable and avoidable cases populating emergency department waiting rooms. Dallas County has significant Health Professional Shortage Areas (HPSA's) and Medically Underserved Areas (MUA's). Furthermore, in Dallas County, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment.

Target Population: Children covered by Medicaid, CHIP or uninsured: approximately 86,000 patients (95% of total patients)

Intervention	DY2	DY3	DY4	DY5
Patients on panel	39,000	50,600	71,000	90,500
Extended hours visits	1,800	12,000	23,000	29,000
RN triage calls	7,000	10,500	15,000	20,000

Project Components and How Project Represents a New Initiative or Significantly Enhances an Existing Delivery System Reform Initiative

Project 1.1.2 "Establish more primary care clinics" does contain core project components. As noted above, we will not be using component (A), expand clinic space but will increase capacity through components (B) expand clinic hours and (C) expand primary care staffing. Milestones and metrics are based on relevancy to the RHP 9"s pediatric population, the community needs for additional pediatric primary care, the RHP priority rating of this project in the highest priority (A) category and the baseline data of non-emergent emergency department use by children.

The project will enhance the current supply of pediatric primary care and lessen the burden of care in current Federally Qualified Healthcare Centers and Parkland's Community Oriented Primary Care Centers (COPCs). This project is based on the inappropriate emergency department use by children in Dallas County.

Community Needs (CN) Addressed:

- CN 3: Healthcare Capacity
- CN 4: Primary Care and Pediatrics
- CN 8: Chronic Disease, CN 9: Specialty Care
- CN 11: Emergency Department Usage and Readmissions

Related Category 3 Outcome Measure(s)

OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization. (Stand alone measure)

This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children. By providing additional hours of access will have better access to primary care services which can reduce inappropriate ED utilization. Use of a nurse triage telephone system can redirect families to more appropriate levels of care, thereby reducing inappropriate ED utilization. Use of the nurse triage telephone system can also direct families to seek care in an urgent care setting or emergency department setting when that level of medical care is indicated.

Relationship to other projects:

138910807.1.1 Expand Pediatric Primary Care
138910807.1.3 Implement Disease Management
138910807.1.4 Expand Pediatric Behavioral Health
138910807.2.1 Expand/Enhance Medical Homes
138910807.2.2 Implement/Enhance Evidence-based Health Promotion Programs
138910807.2.3 Expand/Enhance Patient/Family Navigation
138910807.2.4 Implement/Expand Care Transitions Program
RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-6 Initial Core Set of Health Care Quality Indicators

This project is related to the other Catgegory 1 and 2 projects proposed by children's because four of the other projects (Expand Pediatric Primary Care, Implement Disease Management, Expand Pediatric Behvaioral Health and Expand/Enhance Medical Homes are all focused within the MyChildren's practices. The remaining three projects support overall population health and are supportive of this project to expand the hours of operation in primary care clinics.

Relationship to Other Performing Providers' Projects in the RHP:
Other projects that focus on expanding primary care are:

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	5	1.25
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	8	1.20
Sustainability	15%	8	1.20
Partnership Collaboration	5%	8	0.40
	100%		7.65

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on

HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Project Option 1.3.1 – Implement/Utilize Pediatric-Specific Disease Management System Functionality

Unique Project ID: 138910807.1.3
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Provider's role in region's health care infrastructure (especially for Medicaid and indigent/uninsured): Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured).

MyChildren's payor mix is 75% Medicaid, 15% CHIP, 5% uninsured and 5% commercial insurance.

Intervention: The purpose of this project is to implement a disease management program at the MyChildren's location and in school-based primary care settings in RHP 9. It is a new initiative.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions

Target Population: Children in RHP 9 covered by Medicaid and CHIP or uninsured who use MyChildren's as their primary care provider and who have chronic diseases. Estimated number of patients covered by CHIP, Medicaid or uninsured to be served over course of waiver period 8,800 (10% increase due to attrition and new patients, 95% of volume to account for commercially insured population, plus rounding.)

This project will benefit the targeted population by providing disease management to children with chronic diseases resulting in the best management of chronic disease with the least cost and minimal disruption of daily life for these children and their families.

Intervention	DY3	DY4	DY5
Disease management patients	5,300	7,100	9,000
Disease management contacts	15,900	28,400	45,000

It is estimated that 95% of the above patient population will be in the targeted patient population based on the current MyChildren's payor mix.

Category 1 & 2 Expected Outcomes: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: OD-9 Preventive and Primary Care. IT-3.9.3 Pediatric/Young Adult Asthma Emergency Department Visits. (Stand alone measure) This measure was selected because the project is designed to support appropriate management of asthma and reduce the use of ED services for asthma management.

No additional federal grant dollars are being applied to this project.

Project Description

Children's Medical Center (CMC) has seven (7) Joint Commission Disease-Specific Certified disease management programs and will expand their availability into medical home settings through the MyChildren's network of practices in Dallas and Denton County. This project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (chronic disease management).

Goals and Relationship to Regional Goals

The goal of this project is to expand the CMC-certified disease management programs capacity to treat more patients and to provide the infrastructure and support needed to accomplish standardized, evidence-based chronic illness management in the primary care setting and implement the infrastructure that supports patient population health, panel management and coordination of care. In order to do this, we propose to:

- Expand the CMC certified disease management programs in community ambulatory settings
- Design care coordination strategies that optimize care across a continuum, including home, school and community settings
- Design culturally appropriate patient/family self-management programs for chronic illness management
- Incorporate electronic registries, predictive modeling, decision support and social awareness systems that are pediatric-specific and family focused into team-based practice settings
- Incorporate and maintain evidence-based standards in the pediatric disease management programs
- Design and implement pediatric community-based resource centers for joint patient/family education and behavior change programs, opportunities for patients/families to learn from each other and the creation of support networks for providers, patients and families

Challenges

A major challenge will be changing patient/family behaviors to improve and maintain the health of children with chronic illnesses. Training patients/families in self-management of their own health is a challenge for any population of chronically ill patients. Another challenge will be the ability to risk-adjust the population and tailor the interventions to achieve the best outcomes with limited resources. These challenges will be addressed by using behavior change science, health literacy principles, language and culturally appropriate approaches and the use of community health workers who reside in the community, understand the customs and speak the language. State-of-the-art, evidence-based software will be used for risk-adjusting the population and identifying the children who are appropriate for enrollment in disease management programs and identifying the children who are at highest risk. Challenges of this project will also be addressed by reaching out to other providers and using collaborative learning to address similar challenges or use lessons learned from others to address unique challenges.

Five-year Expected Outcome for Provider and Patients

Implementing and utilizing pediatric-specific disease management system functionality is a prerequisite for many of the improvements targeted by pediatric medical home initiatives to prevent disease, minimize unnecessary exacerbation of chronic illness, train patients/families in effective behavior change and self-management techniques and maintain a higher state of well-being across the family. Additionally, pediatric-specific disease management programs that are electronically supported and integrated consistently across the continuum of care can keep children out of the emergency department, specialist clinics and inpatient beds. The expected result will be decreased ED visits, decreased specialty clinic visits and decreased preventable admissions/ readmissions/ complications (PPAs, PPRs and PPCs).

Starting point/baseline

Baseline will be number of patients enrolled in program during DY1.

Rationale

Effective and accessible pediatric-specific chronic disease management programs have been shown to have a measurable impact on quality of life, reducing the risk and consequences of worsening health conditions, reducing the need for unnecessary ED visits, specialist visits and inpatient admissions/length of stay (LOS).

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, between 2000 and 2010, the number of Children's Medical Center's admissions of youth with a primary or secondary diagnosis of diabetes increased by 34%. Additionally, the racial disparity of higher diabetic-related deaths in African Americans

demonstrated in the adult population is also present among children. According to the Dallas Morning News, "those of Mexican ancestry, for example, are nearly twice as likely to have diabetes as non-Hispanic whites." With the association of diabetes and obesity there is also concern of the future trajectory as low income preschool obesity within the Dallas Metropolitan Statistical Area was 17.2% in 2009, placing many young children at higher risk of developing diabetes in later years. Finally, the Community Needs Assessment Report documented increasing rates of many chronic diseases, including but not limited to asthma and diabetes.

According to Children's Medical Center data, between 2000 and 2010, the number of Children's Medical Center admissions of youth with a primary or secondary diagnosis of asthma increased 15%.

Intervention	DY3	DY4	DY5
Disease management patients	5,300	7,100	9,000
Disease management contacts	15,900	28,400	45,000

It is estimated that 95% of the above patient population will be in the targeted patient population based on the current MyChildren's payor mix.

Project components

All project components will be addressed during this project implementation.

a. Enter patient data into unique chronic disease registry
b. Use registry data to proactively identify, contact, educate and track patients by disease status, risk status, self-management status, self-management status, community and family need
c. Use registry to develop and implement targeted QI plan
d. Conduct quality improvement or project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned", opportunities to scale all or part of the project to a broader patient population and identifying key challenges associated with the expansion of the project, including special considerations for safety-net populations.

Community Needs (CN) Addressed:

- CN 3: Healthcare Capacity
- CN 4: Primary Care and Pediatrics,
- CN 8: Chronic Disease
- CN 9: Specialty Care
- CN 11: Emergency Department Usage and Readmissions

How the Project Significantly Enhances an Existing Delivery System

Children's Medical Center (CMC) has seven (7) Joint Commission Disease-Specific Certified disease management programs, however, resources, infrastructure and technology have been severely limited, and therefore, CMC is only able to care for a very small percentage (<1%) of chronic disease management patients in Dallas County. By expanding the programs into the MyChildren's practices in RHP9, a significant increase in the number of patients is achievable.

Related Category 3 Outcome Measure and Rationale for Selecting Outcome Measure

IT 2.13 Other Admission Rates: Pediatric Quality Indicator PDI #14 Asthma Admission Rate (Standalone measure). This is a provider-defined measure. This measure is based on IT 2-12 Prevention Quality Indicator (PQI) Composite Measures for Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions which are adult-based measures. The Pediatric Quality Indicator PDI #14 will be used for the data definition for the numerator in the outcome measure. PDI #14 was selected because asthma management will be a major component of the disease management program. Past history with Children's limited implementation of an asthma management program demonstrated reduced hospital admissions in the patients enrolled in the program.

Relationship to other projects

138910807.1.1	Expand Pediatric Primary Care
138910807.1.2	Expand Pediatric Primary care Hours
138910807.1.4	Expand Pediatric Behavioral Health
138910807.2.1	Expand/Enhance Medical Homes
138910807.2.2	Implement/Enhance Evidence-based Health Promotion Programs

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	7	1.40
Population Served / Project Size	25%	6	1.50
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	6	0.90
Sustainability	15%	8	1.20
Partnership Collaboration	5%	9	0.45
	100%		7.25

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness

	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact
Moderate Weakness: Lessens impact
Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Year 2 (10/1/2012 – 9/30/2013)	**Year 3 (10/1/2013 – 9/30/2014)**		**Year 4 (10/1/2014 – 9/30/2015)**	**Year 5 (10/1/2015 – 9/30/2016)**
Milestone 1 (P-2): Review current registry capability and assess future needs. P-2.1. Metric: Documentation of review of current registry capability and assessment of future registry needs. a. Numerator: number entered into the registry;0 if documentation is not provided, 1 if it is provided; b. Denominator: total patients with the target condition; c. Data source: EHR systems and/or other performing provider documentation. d. Rationale/Evidence: Used to determine if the necessary elements for a chronic disease registry are in place for optimal care management. Necessary elements may include inpatient admissions, emergency department visits, test results, medications, weight, activity level changes and/or diet changes. e. Goal: Complete by 9/30/12 Milestone 1 P-2 Estimated Incentive Payment *(maximum amount):* $3,116,049	Milestone 2 (P-4): Implement/expand a functional disease management registry. P-4.1. Metric: Registry functionality is available in 50% of the Performing Provider's sites and includes an expanded number of targeted diseases or clinical conditions. a. Numerator: Number of sites with registry functionality b. Denominator: Total number of sites c. Data Source: Documentation of adoption, installation, upgrade, interface or similar documentation d. Rationale/Evidence: Utilization of registry functionalities helps care teams to actively manage patients with targeted chronic conditions because the disease management registry will include clinician prompts and reminders, which should improve rates of preventive care. Having the functionality in as many sites as possible will enable care coordination for patients as they access various services throughout a Performing Provider's facilities. Registry use can be targeted to clinical conditions/diseases most pertinent to the patient population (e.g., diabetes, hypertension, chronic heart failure). e. Goal: 50% of sites (7 sites) with disease registry implemented by 9-30-14	Milestone 4 (I-16): Increase the number of patient contacts recorded in the registry relative to baseline rate. I-16.1. Metric: Total number of in-person and virtual (including email, phone and web based) visits, either absolute or divided by denominator. a. Numerator: Number of patient contacts recorded in the registry b. Denominator: Number of targeted patients in the registry ("targeted" as defined by Performing Provider) c. Data source: Internal clinic or hospital records/documentation d. Rationale/evidence: help physicians and other members of a patient's care team identify and reach out to patients who may have gaps in their care. Goal: Average 2 contacts per eligible patient, 14,200 contacts by 9/30/2015 Milestone 4 I-16 Estimated Incentive Payment *(maximum amount):* $1,591,018 Milestone 5 (I-17): Use the registry	Milestone 6 (I-16): Increase the number of patient contacts recorded in the registry relative to baseline rate. I-16.1. Metric: Total number of in-person and virtual (including email, phone and web based) visits, either absolute or divided by denominator. a. Numerator: Number of patient contacts recorded in the registry b. Denominator: Number of targeted patients in the registry ("targeted" as defined by Performing Provider) c. Data source: Internal clinic or hospital records/documentation d. Rationale/evidence: help physicians and other members of a patient's care team identify and reach out to patients who may have gaps in their care. Goal: Average 3 contacts per eligible patient, 27,000 contacts by 9/30/2016 Milestone 6: I-16 Estimated Incentive Payment *(maximum amount):* $ $2,569,346

Project Option 1.12.2 - Enhance Community-Based settings Where Behavioral Health Services May Be Delivered in Underserved Areas

Unique Project ID: 138910807.1.4
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Annually, Children's has approximately 600,000 patient contacts.

Provider's role in region's health care infrastructure (especially for Medicaid and indigent/uninsured): Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured).

MyChildren's payor mix is 75% Medicaid, 15% CHIP, 5% uninsured and 5% commercial insurance.

Intervention: The purpose of this project is to bring behavioral health services into the primary care setting through the MyChildren's offices. It is a new initiative.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: Children covered by Medicaid and CHIP who have behavioral health needs and use MyChildren's for their primary care provider. Estimated number of patients to be served over course of waiver period 4,700 patients. Provide behavioral health services to children in the medical home setting to allow for more rapid access to behavioral health services and better coordination of behavioral and medical services for children and their families.

Intervention	DY3	DY4	DY5
Behavioral health patients	2,600	3,500	4,500

It is estimated that 95% of the above patient population will be in the targeted patient population based on the current MyChildren's payor mix.

Category 1 & 2 Expected Benefit: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: IT 1-20 Other Outcome Improvement Target: Follow-up visits after new anti-depressant medication prescription. This is a provider-defined outcome measure. This improvement target was selected to support the appropriate management of pediatric patients when a new antidepressant is started based on guidelines by the FDA. It is important to have frequent contact with pediatric patients during initiation of an antidepressant due to potential for worsening of symptoms and increased suicidal ideations.

The project will not use additional federal grant dollars.

Project Description

This project is based on community needs and local data that demonstrate the project is addressing an area of poor performance (pediatric access to behavioral health care integrated into a medical home). Expand pediatric behavioral health capacity in CMC primary care settings to align and coordinate care for behavioral and medical illnesses to improve patient/family self-management and reduce unnecessary exacerbation of chronic illnesses. Collaborate with Timberlawn Services for coordination of care between medical services and behavioral health services.

Goals and Relationship to Regional Goals

The goals of the project are to:

- Build clinical protocols with primary care physicians and psychiatrists
- Place pediatric behavioral health capacity (social workers and psychologists) in primary care settings
- Integrate behavioral health and medical health treatment plans into a family-focused, comprehensive and culturally appropriate approach, using a care team approach
- Improve coordination of care between behavioral health and medical providers

The goals address regional goals of better coordination of care between behavioral health and medical providers and increasing access to behavioral health services.

Challenges

A major challenge will be to identify, recruit and retain pediatric behavioral health staff. Second, another challenge will be the development of processes and protocols to integrate behavioral health services into the primary care setting and align/integrate behavioral health and medical services. We will be working with Timberlawn Psychiatric Services, which currently provides inpatient and outpatient behavioral health services to children and adolescents in Dallas County, and other behavioral health providers in RHP 9 to assist us in overcoming the challenges noted. We will also be working with the Pediatric Psychiatry division of the

Department of Psychiatry at UT Southwestern Medical Center to assist us in recruitment of staff and development of processes and protocols.

Five-year Expected Outcomes to Provider and Patients:

- Increase behavioral health visits in primary care center
- Transition appropriate patients from specialty mental health care to primary care
- Implement primary care-initiated behavioral health visits in primary care clinic

Starting point/baseline

In 2011, there were no behavioral health services available in the MyChildren's locations. As a result, medical professionals and behavioral health professionals were treating the same children without common evidence-based protocols and without an integrated family-focused, comprehensive and culturally appropriate care team approach.

Rationale

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, 2012, the behavioral health (mental health and substance abuse) system in Dallas County is delivered via the NorthSTAR program, instead of a traditional local mental health authority system. Since the program's inception, the growth in enrollment has outpaced funding such that the funding per person is 30% less today than when the program started in 1999. Texas ranks 50th nationally in mental health funding. Despite the strong relationship between behavioral health and medical illness related outcomes and costs, the percentage of the 200% FPL population receiving behavioral health care to primary care settings is below the national average in Dallas County (19.8% vs. 37.1%). Children's Medical Center, one of the largest providers of primary care to low income populations in Dallas County, is not a NorthSTAR provider, and consequently, children who may be successfully served in primary care settings are referred to NorthSTAR. This results in dilution of limited NorthSTAR funds, inadequate services available to children, and coordination of care issues.

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, 2012, the number of Dallas County children who are receiving publicly funded mental health services has tripled from 2000 to 2010. In Dallas County, the number of children identified with a diagnosable emotional disturbance or addictive disorder has increased to approximately 142,000 children, with 5% of those children experiencing a significant impairment as a result. Among youth between the ages of 12-17, 7.2% have experienced a major depressive episode. However, mental health services available to children are limited and are often times not adequately covered by private and public insurance plans. Services in the health care community frequently do not include the family-focused and comprehensive approach needed to adequately address these issues. Rather, nearly all of the intensive service availability, including evidence-based programs such as multi-systemic

therapy, is provided through the Juvenile Justice System. Furthermore, the number of youth served in the juvenile justice system is increasing, as evidenced by a 17% increase in the number of children receiving psychotropic medications in juvenile detention from 2010 to 2011.

Hispanics comprise 40% of the population but only 25% of the NorthSTAR population. While there is a lack of services available and written materials available in Spanish, it is difficult to characterize the extent of the need, because data on primary language is not collected.

Expanded pediatric behavioral health capacity and integration with medical care in the primary care setting in a family-focused, comprehensive and culturally appropriate manner will improve access for children to behavioral health services, prevent unnecessary exacerbation of chronic illnesses, improve patient/family self-management and improve cost and quality outcomes. The result will be reduced ED visits, specialty care visits and preventable admissions/readmissions for the identified population.

The milestones and metrics for this project are based on the relevancy to RHP9 population, the community need, RHP priority and the starting point.

Intervention	DY3	DY4	DY5
Behavioral health patients	2,600	3,500	4,500

It is estimated that 95% of the above patient population will be in the targeted patient population based on the current MyChildren's payor mix.

While the patient volumes are low for this project, it is believed that it a vital project which can result in substantial total cost savings by appropriately managing pediatric patients with behavioral health issues, children can remain and be successful in school and stay out of the juvenile criminal justice system where a higher percentage of juveniles have untreated or undertreated behavioral health issues.

Project Components

There are no project components for this project.

Community Needs (CN) Addressed:

- CN.4: Primary Care and Pediatrics
- CN.5: Behavioral Health
- CN.6: Behavioral Health and Primary Care
- CN.12: Emergency Department Usage and Readmissions.

Project Represents a New Initiative

In 2011, there were no behavioral health services available in the MyChildren's locations. As a result, medical professionals and behavioral health professionals were treating the same children without common evidence-based protocols and without an integrated family-focused, comprehensive and culturally appropriate care team approach. This project will bring behavior health professionals into the MyChildren's locations to work side-by-side with medical professionals.

Related Category 3 Outcome Measure

Category 3 Outcome: IT 1-20 Other Outcome Improvement Target: Follow-up visits after new anti-depressant medication prescription. This is a provider-defined outcome measure. This improvement target was selected to support the appropriate management of pediatric patients when a new antidepressant is started based on guidelines by the FDA. It is important to have frequent contact with pediatric patients during initiation of an antidepressant due to potential for worsening of symptoms and increased suicidal ideations.

Relationship to other projects

138910807.1.1 Expand Pediatric Primary Care
138910807.1.2 Expand Pediatric Primary care Hours
138910807.1.4 Expand Pediatric Behavioral Health
138910807.2.1 Expand/Enhance Medical Homes
138910807.2.2 Implement/Enhance Evidence-based Health Promotion Programs
138910807.2.3 Expand/Enhance Patient/Family Navigation

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	7	1.40
Population Served / Project Size	25%	7	1.75
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	6	0.90
Sustainability	15%	8	1.20
Partnership Collaboration	5%	9	0.45
	100%		7.50

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on

HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Project Option 1.13.1 - Development of Behavioral Health Crisis Stabilization Services as Alternatives to Hospitalization

Unique Project ID: 121758005.1.1
Performing Provider Name/TPI: Dallas County/121758005

Provider: Dallas County, with over 2.4 million residents, is one of the seven Counties in the NorthSTAR behavioral health managed care system, which serves Medicaid eligible and indigent consumers. This project is a new initiative for Dallas County and represents a change in roles from planning, coordination and oversight to direct consumer services.

Interventions: This project will implement a data sharing system among providers that will provide point of service data and outcomes data for planning and quality improvement. The project will also provide the following services to persons in behavioral health crisis as alternatives to emergency department and/or hospitals: crisis call center; mobile crisis teams; telehealth and telemedicine; and post acute intensive case management teams.

Need for the project: This project is needed to reduce the utilization of higher levels of care (hospitals and emergency departments) by consumers in Dallas County and the associated over-representation of persons with behavioral health needs in the Dallas County Jail. The number of persons ordered into behavioral health services through the civil mental health courts has increased from 5,938 in 2007 to 6,830 in 2011 (15% increase). The number of persons committed to the Dallas County Jail who also have a history of receiving behavioral health services has increased from 7% of "jail bookins" in 2007 (6,501 consumers) to 20% in 2012 (13,428 consumers).

Target Population: The target population is residents of Dallas County who need behavioral health crisis stabilization services and who are pending intake into or release from the Dallas County Jail or for whom an Order for Protective Custody for commitment into services is pending before the civil mental health courts. For the past five years, Medicaid and indigent consumers have comprised 58% of those persons placed under an Order of Protective Custody. Currently 20% of all persons booked into the Dallas County Jail have a history of receiving NorthSTAR services.

Category 1 expected patient benefits: The project will serve 150 consumers per month upon initial implementation in the fourth quarter of DY2, increasing to 250 consumers per month in DY3, 350 per month in DY4 and 450 per month in DY5. Consumers will benefit from these services by:

- Easier access to community-based services and less need for hospitalizations
- Reduced unnecessary contact with the criminal justice system
- Fewer episodes of presentations at psychiatric emergency departments
- Increased levels of active recovery and improved quality of life

Category 3 Outcomes: This project will reduce the number of persons in the Dallas County Jail who also need behavioral health services by 2% in DY4 (35 per month) and by 3% in DY5 (50 per month). The project will also reduced the number of persons placed into emergency departments and hospitals through the Order of Protective Custody process by 3.5% in DY4 (25 per month) and by 4.5% (32 per month) in DY5.

Project Description

This project is a new initiative for Dallas County. Services will be delivered by providers who are part of the NorthSTAR services network with an expansion of existing services to the targeted population. The project goal is to develop and implement a menu of integrated and coordinated behavioral health crisis services that can be accessed by consumers instead of emergency departments and/or hospitalization. Services will include integrated and coordinated crisis hotline, telehealth and telemedicine crisis services, mobile crisis teams, and post-acute intensive case management teams. This menu of services will shift demand from acute care services to community based services.

Development of acute care targets will be a central focus of DY 2 and will bring together data sources that have not been previously afforded the opportunity for analysis. For example, one provider captures data regarding involuntary consumer migration patterns through the hospital system. This data can be triangulated with acute care services provided by mobile crisis teams operated by a different provider to identify utilization patterns that will guide the development of acute care strategies specific to the needs of Dallas County. There will be focused planning on developing strategies to implement direct services during the 4th quarter of Demonstration Year 2. Our primary data sharing and service delivery targets are: Parkland's Primary Care Clinics and Emergency Department, Dallas County Jail, City of Dallas Detention Center and any access point where a less restrictive option would be pursued if such services were available.

The planning period in DY 2 concludes with a solid foundation of baseline data and improvement targets. At the end of DY 2, the following will be in place:

- A thorough mapping of the crisis stabilization system
- A permanent capacity for data sharing
- A solid grounding in baseline data to drive executable service delivery targets
- An implementation plan vetted with stakeholders and tailored to meet the needs of consumers in acute distress within the challenges of the local landscape

Service implementation begun fourth quarter of DY 2 continues in DY 3-5 with fully functioning:

- Data sharing and system reporting that allows policymakers informed decision making concerning the most expensive components of the service delivery system
- Crisis Call center access for the target population
- Mobile crisis teams for the target population
- Telehealth and telemedicine
- Post acute intensive case management teams

Challenges Faced by Performing Provider

Dallas County as an entity has a unique role in the continuum of behavioral health services available in RHP 9. Through its Sheriff's Department, Dallas County has statutory responsibility for operating the Dallas County Jail. As is true with other jurisdictions across the State, persons with significant behavioral health treatment needs comprise a disproportionate percentage of the jail population. Dallas County has developed and implemented several programs for identifying those in jail and diverting them into community-based services when appropriate. However, hospitalization remains the primary option for persons in behavioral health crisis. Many consumers who are appropriate for diversion from jail require stabilization that is not available in the jail or community.

Dallas County's governing body, the Dallas County Commissioners Court, has statutory authority to approve the annual budget and tax rate for the Dallas County Hospital District. Parkland Memorial Hospital is the centerpiece of the hospital district. Through the main hospital campus and the associated network of Community Oriented Primary Care Clinics (COPC), Parkland is the primary provider of health care to the medically indigent residents of Dallas County. As with most safety net hospitals, Parkland faces constant pressures in providing adequate access to care. Persons presenting at a community clinic who are in behavioral health crisis are often directed to psychiatric hospitalization as there are not resources at the clinics to address the crisis.

Dallas County is one of seven counties that comprise the North Texas Behavioral Health Authority (NTBHA) service region. NTBHA is the statutory local mental health authority for the NorthSTAR managed care system. NorthSTAR is a "carve out" system where Medicaid and medically indigent consumers in the seven county service area receive behavioral health services from a network of providers contracted to a single behavioral health organization (BHO), Value Options. The NorthSTAR system has been very effective in achieving the efficiencies expected from any managed care delivery system. However, funding from the State of Texas has not kept pace with the demand for services. NorthSTAR has responded by reducing the availability of community-based outpatient services to ensure that consumers can continue to access hospitalization and medication services. The lack of funding in NorthSTAR has further increased the reliance on hospitalization for crisis resolution.

Impact of Project on Dallas County Challenges

Increased access to behavioral health crisis stabilization services will have a positive impact on the challenges faced by Dallas County as follows:

- More people can be diverted from the Dallas County Jail if they can be referred to the planned crisis stabilization services.
- Persons presenting in crisis at the Parkland COPC clinics can access community-based services instead of being referred to a hospital or, in many cases, committed to a hospital through the mental health courts process.
- Decreased utilization of hospitalization for behavioral health crisis will reduce the amount of NorthSTAR funding allocated to higher levels of care, including hospitalization, and free up more funding to be allocated to community-based services.

Project's Relationship to Regional Goals

This project is well aligned with the three priories around which the Region 9 plan was developed as follows:

- Reduce Capacity Restraints: This project will provide additional service capacity for persons in behavioral health crisis that is not currently available.
- Improve Care Coordination and Management: The services provided under this project will include resources specifically designed to increase care coordination and management. The improved data sharing, collection and reporting will allow for a system-wide analysis of care coordination/management with data-driven improvements.
- Strengthen Provider Performance: The improved data analysis available through this project will allow individual providers access to outcome data that will lead to improved performance.

5-year Expected Outcomes for Performing Provider and Consumers

The expected outcomes for Dallas County include:

- Reduced jail population and lower cost for treating inmates with behavioral health needs in the jail.
- Reduced numbers of involuntary commitments to hospitalization through the Mental Health Courts.
- Reduced utilization of hospitalization for persons in behavioral health crisis, which will lower NorthSTAR expenditures for higher levels of care and increase funding available for community-based services.

This project is focused on NorthSTAR eligible consumers, who are all either Medicaid eligible or indigent. In 2012, 20% of the persons "booked into" the Dallas County Jail have received

NorthSTAR services in the past. 58% of the consumers committed into behavioral health services through an Order of Protective Custody are either Medicaid eligible or indigent. Expected quality of life outcomes for consumers/patients include:

- Easier access to community-based services and less need for hospitalizations
- Reduced unnecessary contact with the criminal justice system for persons with behavioral health disorders.
- Fewer episodes of presentations at psychiatric emergency departments
- Increased levels of active recovery from their behavioral health challenges and improved quality of life

Starting Point/Baseline

Dallas County Jail 1-1-2007 through 9-30-2012

The number of persons detained at the Dallas County Jail compared to the number of those persons who have a history of receiving public behavioral health services through NorthSTAR provides a baseline for the volume of behavioral health consumers in the jail. While the number of persons detained has decreased since 2008, the proportion of persons with a NorthSTAR history has increased.

Year	Total inmates detained	Total inmates with history of NorthSTAR services	Percent of inmates with NorthSTAR history
2007	93,413	6,501	7%
2008	99,580	8,200	8%
2009	98,407	10,636	11%
2010	96,245	12,994	14%
2011	90,429	15,810	17%
2012 (through 9-12)	66,106	13,428	20%

Commitments to Hospitals by Dallas County Mental Health Courts 2007-2011

The data below shows the number of consumers who are transitioned against their will to higher levels of care. On average this currently equates to about 570 consumers per month, which represents a 14% increase as compared to a historical pattern of approximately 500 per month until 2009.

Orders Of Protective Custody	Payor Source For Hospitalization					Total	Originating From Parkland	
Year	Medicaid	Medicare	NS ndigent	NS edicaid	Other		PED & 8N	All Other
2007	151	1326	2500	892	1069	5938	3223	195
2008	161	1398	2496	838	976	5869	3308	176
2009	176	1372	2579	805	1050	5982	3061	145
2010	203	1708	2977	697	1245	6830	3058	150

2011	257	1815	2851	815	1100	6838	2920	163
Grand Total	948	7619	13403	4047	5440	31457	15570	829

Rationale for Project - Community Needs ID: CN.5

This project was selected based on needs identified through current community planning efforts to improve the behavioral health care delivery system. Parkland Hospital and Dallas County collaborated to engage consultants, TriWest/Zia, to conduct a detailed analysis of the behavioral health delivery system in Dallas County. The consultant's assessment included detailed data analysis and interviews with community stakeholders including consumers, family members, providers, advocates, funders, elected officials and other stakeholders. The engagement resulted in a formal report, Assessment of the Community Behavioral Health Delivery System in Dallas County. The final report included a detailed analysis of available cost and outcomes data and recommendations for community action, collectively referred to as the "Twelve Steps for Recovery."

TriWest/Zia recommended the establishment of a formal planning body to focus on implementing the recommendations from the assessment and improving the local behavioral health delivery system. The Dallas County Behavioral Health Leadership Team (BHLT) was chartered by the Dallas County Commissioners Court in January 2011 and has met monthly since. This project has been approved by the BHLT, which will serve as the governing body for the project.

Another of these twelve recommendations for action is the basis for this project. The consultants specifically found that "*The Dallas County system is designed in such a way that it has become highly crisis-reactive, and as a result significant resources are invested in what we would call "back end," more expensive crisis response (for example, psychiatric emergency services and 23-hour observation), rather than lower-cost proactive crisis response that would reduce the "crisis tone" (and crisis cost) in the system over time*." Additionally, TriWest/Zia found that almost 30% of Dallas County residents with severe behavioral health needs were served in the Dallas County Jail in 2010. Finally, TriWest Zia gives evidence that significantly less Dallas County consumers with serious behavioral needs are served outside the primary care setting as compared to national averages (37.1% nationally, 19.8% in Dallas County).

Project Components

a) Convene community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system and develop a specific action plan that identifies specific crisis stabilization services to address identified gaps. The existing Dallas County Behavioral Health Leadership Team (BHLT) will serve as the stakeholder group to conduct a gap analysis. The BHLT has broad representation from the community and additional stakeholders will be invited to participate as needed. The BHLT meets monthly with working groups meeting as

needed. A standing committee will be delegated the task of developing the gap analysis and implementation plan for review and approval by the full BHLT.

b) Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service. The previously referenced consultants' report will serve as the starting point for system analysis. Data reports generated by the BHLT will also be utilized. Additional data will be extracted from current providers as needed.

c) Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plant to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients. This assessment will be conducted through BHLT. All final recommendations will be approved by BHLT.

d) Explore potential crisis alternative service models and determine acceptable and feasible models for implementation. The BHLT will review the proposed service models and authorize revisions to the service plan if indicated by the data and gap analysis. Once approved by the BHLT, Dallas County will proceed with implementing the needed services, primarily through contracts with existing providers.

e) Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify "lessons learned," opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s). There will be a robust quality improvement process utilized throughout the life of the project. There will be a working group of the BHLT tasked with monthly review of program data and reporting the results of that review to the BHLT each month. The monthly review will include recommendations for program changes as indicated by the data. The monthly data review will include numbers served and diverted from higher levels of care and will be focused on barriers that are encountered and solution for overcoming those barriers.

Milestones and Metrics

The milestones and metrics for this project were developed based upon the RHP Planning Protocol guidance. Each of the process metrics represent a specific step in the planning and implementation process, with appropriate written documentation of all decisions. Once services are initiated, there will be monthly gathering, analysis and reporting of service data.

How the project represents a new initiative for Dallas County

This project will move Dallas County into a new role as a direct service provider. Dallas County will function much like a general contractor for the project, with local providers contracting for direct service provision. Dallas County, through its BHLT, will manage this project, provide the required IGT matching funds and report outcomes. The BHLT will be the primary vehicle for reviewing project outcomes and adjusting service delivery as needed.

Related Category 3 Outcomes Measure

- IT-9.1: Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons
- IT-9.2 ED appropriate utilization

Rationale for selecting outcomes

These two outcome measures directly capture the goals of this project. Local and national data indicate that persons with a history of frequent jail admissions also have a history of increased use of behavioral health services, especially higher levels of crisis services including emergency departments. The interventions in this project will reduce the number of persons cycling through the local jail and the number of jail admissions for persons with a history of jail recidivism. The project interventions will also reduce the number of persons accessing emergency departments who have behavioral health treatment needs. These two outcomes measures will show if the project has the predicted impact both on the entire system in reduced costs for jail and emergency department utilization and on those persons who receive the project services in less time in jail, fewer behavioral health crisis and improved progress towards personal recovery.

Relationship to other Projects

Other projects submitted for RHP9 related to improving the behavioral health system include:

138910807.1.4 -Children's Medical Center	121988304.1.1- Lakes Regional MHMR
121988304.1.2- Lakes Regional MHMR	020943901.1.3- Medical City Dallas Hospital
135234606.2.1- Denton County MHMR	135234606.2.2- Denton County MHMR
135234606.2.3- Denton County MHMR	127295703.2.2- Parkland Hospital System

Plan for Learning Collaborative. Dallas County will be active in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Dallas County will also participate in any Outocmes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. Dallas County believes that the exchange of best practices and shared learning will contribute significantly to continuous quality improvement and will advance the project.

Project Valuation

This project is valued based upon the costs of reducing jail stays and the costs avoided by providing community based crisis services instead of the more expensive services through emergency departments and psychiatric hospitalizations. The Category 1 and associated Category 3 projects have a total value of IGT and Federal funds of $19,799,339. The project will divert 35 individuals from jail each month of DY3 and DY4 and 50 per month in DY5. At a cost of $10,960 for a jail stay (police, jail and healthcare in jail) for a person with behavioral health needs, these 1,440 jail stays that are avoided have a combined value of $15,782,400. The project will divert 25 people from court ordered behavioral health services each month of DY3 and DY4 and 32 per month in DY5. At a combined system cost of $4,300 per court commitment (cost for police, courts and treatment), these 984 diversions have a combined value of $4,231,200. These value calculations do not include other costs expected to be avoided, such as placement in the state hospitals at a cost of $11,692 per stay.

Project Option 1.14.2 – Behavioral Health Workforce Development Program

Unique Project ID: 137252607.1.1
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/137252607

IGT Entity: Dallas County MHMR Center dba Metrocare Services

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Intervention: Implement strategies to train behavioral health students/residents to serve medically indigent public health consumers in RHP 9

Need for the project: Community mental health providers like Metrocare primarily serve low-income populations with both social and psychiatric needs. A rapid growth in patients has been coupled with a shortage of professionals willing to care for this population. An aging workforce and existing psychiatrists, outside of the public system, who express an unwillingness to accept new patient with Medicaid make this type of project critical to address future workforce needs.

Target population: Medically indigent clients along with current mental health students being educated to become: psychiatrists, licensed psychologists, nurse practitioners, physician assistants, nurses, social workers, licensed professional counselors, licensed marriage and family therapists, licensed chemical dependency counselors, and peer support specialists.

Category 1 or 2 expected patient benefits: Increased access to professionally trained behavioral healthcare providers.

Category 3 outcomes: We expect improvement in patient satisfaction IT-6.1 with respect to improved access to care and improved relationship with behavioral health providers.

Project Description

Develop Workforce enhancement initiatives to support access to behavioral health providers in underserved markets and areas (e.g., psychiatrists, psychologists, LMSWs, LPCs, and LMFTs.)

The goal of the project is to enhance access and reduce shortages in specialty behavioral health care and to improve consumer choice, by expanding the number of behavioral health professionals—Psychiatrist, Child Psychiatrists, Psychologist, Licensed Master Social Workers (LMSW), Licensed Professional Counselors (LPC) and Licensed Marriage &Family Therapists (LMFT) trained in a community mental health setting (i.e., at the Center for Education and Research at Metrocare (CER). There is a shortage of psychiatric providers in Dallas County. From a report of the Public Consulting Group of all Texas Psychiatrist in 2010, 98.5% indicate that they would not take any new Medicaid patients. Those new patients for behavioral health

services will be turning to the public sector for care. The supply of behavioral healthcare providers is inadequate throughout most of the State.

http://ps.psychiatryonline.org/article.aspx?articleID=85362

Extensive empirical research, summarized in several reviews and codified in practice guidelines, recommendations, and algorithms, demonstrates that several pharmacological and psychosocial interventions are effective in improving the lives of persons with severe mental illnesses. Yet the practices validated by research are not widely offered in routine mental health practice settings.

Using our training to educate students/residents on the use of specific medications prescribed in specific ways as well as the use of psychosocial interventions such as supported employment, various approaches to illness self-management, family psycho-education, case management based on the principles of assertive community treatment, and substance abuse treatment that is integrated with mental health treatment (16).

We are proposing that students/residents do not seek employment serving the medically indigent primarily due to not being exposed to that population during their education. Therefore, the CER plans to train students/residents in behavioral health care throughout Metrocare's wide array of clinical settings. Students are currently receiving excellent education in evidence based practices and we would like to combine that education with real world experience serving the medically indigent. The benefit of this intervention would be two fold. We feel that a percentage of the students/residents that we train will then seek employment serving the medically indigent as they transition into their profession and we also feel that due to this collaboration of real world experience with a present day education the patient satisfaction scores will increase for the patients that are being treated by students/residents.

We plan to improve the behavioral health care by training students/residents using evidence based practices. With that training we provide the evidence based practices of:

Illness Management and Recovery:
Illness management is a broad set of strategies designed to help individuals with serious mental illness collaborate with professionals, reduce their susceptibility to the illness, and cope effectively with their symptoms. Recovery occurs when people with mental illness discover, or rediscover, their strengths and abilities for pursuing personal goals and develop a sense of identity that allows them to grow beyond their mental illness. Research on illness management for persons with severe mental illness, including 40 randomized controlled studies, indicates that psychoeducation improves people's knowledge of mental illness; that behavioral tailoring helps people take medication as prescribed; that relapse prevention programs reduce symptom relapses and re-hospitalizations; and that coping skills training using cognitive-behavioral techniques reduces the severity and distress of persistent symptoms.

http://store.samhsa.gov/product/Illness-Management-and-Recovery-Evidence-Based-Practices-EBP-KIT/SMA09-4463

Family Psychoeducation:
Psychoeducation was developed in order to help those suffering with mental illness, as well as others who were seeking information about mental illness. Psychoeducation also fulfills a third function, which is to provide a way for individuals to access and learn strategies to deal with mental illness and the effects it can have on those it touches.

It is important to note that psychoeducation is not a form of treatment, but is instead used as part of an overall plan for treatment. It is documented in the medical field that the more informed an individual becomes regarding his or her condition and its effects on their life; the more the individual can take control over the illness and not the other way around. As a result, the individual suffering with a mental illness can reduce their episodes, as well as enjoy a reduction in intensity and duration.

When whole families are involved in the treatment of someone dealing with a mental illness, it is common for all members to become involved in family psychoeducation. This approach helps to train family members on how best to work together with mental health professionals as part of the overall treatment plan for the individual. When the family approaches management and even recovery as a team, patient outcomes are improved.

As patients with schizophrenia or other mental disorders are trying to re-instate a normal life, family psychoeducation can provide the necessary tools to help guarantee success. Not only are individuals able to return home more quickly with the use of family psychoeducation, they also have increased rates of participation in vocational rehabilitation and employment, decreased costs of care and improved well-being of all involved family members.

Training Therapists in Evidence-Based Practice: A Critical Review of Studies From a Systems-Contextual Perspective
Rinad S. Beidas, Philip C. Kendall
Clinical Psychology: Science and Practice, Volume 17, Issue 1, pages 1–30, March 2010
Article first published online: 10 MAR 2010
DOI: 10.1111/j.1468-2850.2009.01187.xEvidence-based practice (EBP), a preferred psychological treatment approach, requires training of community providers. The systems-contextual (SC) perspective, a model for dissemination and implementation efforts, underscores the importance of the therapist, client, and organizational variables that influence training and consequent therapist uptake and adoption of EBP. This review critiques the extant research on training in EBP from an SC perspective. Findings suggest that therapist knowledge improves and attitudinal change occurs following training. However, change in therapist behaviors (e.g., adherence, competence, and skill) and client outcomes only occurs when training interventions address each level of the SC model and include active learning. Limitations as well as areas for future research are discussed.

Academic Psychiatry 2005;29:180-186. 10.1176/appi.ap.29.2.180Public-Academic Partnerships: Public Psychiatry Fellowships: A Developing Network of Public-Academic Collaborations

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

- To enhance access and reduce shortages in specialty behavioral health care.
- To Increase the number of outpatient psychiatric residents and other behavioral health trainees rotating through the Center for Education and Research.
- To enhance the best practices and quality of care, students/residents will promote recovery from behavioral health disorders.

Challenges

Community mental health providers like Metrocare primarily serve low-income populations with both social and psychiatric needs. A rapid growth of patients has been coupled with a shortage of professionals willing to care for this challenging population.

Organizations that traditionally treat the medically indigent do not have dedicated resources to support and train individuals that may be interested in treating the medically indigent population. The Center for Education and Research at Metrocare is confident that if trainees are mentored by dedicated staff to provide high quality education and supervision that not only will the consumers be more satisfied with treatment but some trainees will seek employment in a community mental health setting.

5-Year Expected Outcome for Provider and Patients

- Baseline is 12.
- Increase number of behavioral health students/residents trained by 24 over baseline in DY2
- Increase Medicaid eligible/indigent being treated for a behavioral health condition from baseline 500 to 750 in DY2
- Increase behavioral health students/residents trained by 36 over baseline in DY3
- Increase Medicaid eligible/indigent being treated for a behavioral health condition from baseline 750 to 1000 in DY3
- Increase behavioral health students/residents trained by 48 over baseline in DY4
- Increase Medicaid eligible/indigent being treated for a behavioral health condition from baseline 1000 to 1250 in DY4
- Increase behavioral health students/residents trained by 60 over baseline in DY5

- Increase Medicaid eligible/indigent being treated for a behavioral health condition from baseline 1250 to 1500
- Increase in patient satisfaction scores
- Increase in number of trainees that enter the workforce treating the Medicaid eligible/indigent from 2 in DY3, 7 in DY4 and 12 in DY5

Rationale

The current shortage of public behavioral health practitioners, especially those within the field of psychiatry is of great concern. A survey conducted by a national physician search also indicates the demand in this field is growing faster than any other medical specialty. One in four adults in the U.S. experiences a diagnosable mental illness in a given year. Six percent have a serious mental illness. Nearly half of all adults in the U.S. will have a diagnosable mental health condition in their lifetime. People experiencing mental illness can achieve recovery and wellness when appropriate mental health services and supports are available. Metrocare would like to leverage its broad range of clinical services to offer a unique and rewarding education experience to its trainees. For example trainees could complete rotations in our dual diagnosis residential treatment center, on an ACT team, in our special needs offender program, the autism program, the new onset program, treatment foster care, therapeutic foster care, and behavioral psychological services.

The customized process milestone was created for this project in order to evaluate the programs' success at training a larger quantity of students/residents year after year. In addition, the improvement milestone was also created for this project to show a year after year increase in the number students/residents that seek employment serving the medically indigent once their education and training has been completed.

Project Components

Project Option 1.14.2 has no project components. It is an "other" project option.

Unique community need identification numbers the project addresses

- CN.5: Behavioral Health
- CN.6: Behavioral Health and Primary Care
- CN.7: Behavioral Health and Jail Population

How the project represents a significant enhancement to an existing delivery system reform initiative

This project is an enhancement to the behavioral health care delivery system by training additional staff in an innovative manner to encourage their career track in the public mental health care system. This project will do much to address the shortage of behavioral health providers.

Related Category 3 Outcome Measure(s)

IT-6.1 Percent improvement over baseline of patient satisfaction scores

This protocol was chosen in order to connect the training and increase in number of professionals employed to serve the medically indigent client back to an emphasis on patient satisfaction.

The CER must remain focused not only on high quality training of best clinical practices but also on tracking and monitoring patient satisfaction scores. Patient satisfaction scores should lead our trainees in understanding that a patient whom is engaged and satisfied with his/her treatment is more likely to remain stable and use less intensive services than a patient whom is not satisfied with his or her care.

The CER is confident that the collaborative nature of combining mental health classroom education with a real world experience using evidence based practices along with supervision will produce higher satisfaction scores in the clients that have been treated by a resident and/or student versus a client that has not been treated by a student and/or resident.

Relationship to Other Projects

This Public Behavioral Health Workforce Development project compliments the other Metrocare projects which create infrastructures to handle a wide array of clinical needs with an anticipated increased volume of patients. The project addresses some of the human resource/workforce development and preparation needed for all of the projects.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Other projects submitted for RHP9 related to improving the delivery system for behavioral health include:

138910807.1.4 Children's Medical Center	121988304.1.1 Lakes Regional MHMR
121988304.1.2 Lakes Regional MHMR	020943901.1.3 Medical City Dallas Hospital
135234606.2.1 Denton County MHMR	135234606.2.2 Denton County MHMR
135234606.2.3 Denton County MHMR	127295703.2.2 Parkland Health System

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The true value of the Behavioral Health Workforce Initiative (The Center for Education and Research) will be realized in the future. Identifying the declining deficit of qualified mental health professionals now, highlights the issue and allows the community to address the problem and work on a solution. "Most Texas counties are federally designated mental health professional shortage areas as of March 2010." (Mental Health of Texas)

Training now will provide the needed staff for the future. The CER encourages local trainees/psychiatry residents to explore the public mental health sector. As these individuals choose to work in this setting the ever growing census of patients needing help will have qualified professionals to care for them. Each new psychiatrist working in a mental health clinic can carry a patient load of 800 patients, seen throughout a calendar year. When there are doctors in a community, the patients care is increased with more frequent visits. Transportation to out of county resources is no longer an issue, and patients are more apt to remain in the work force and stable in their family structure.

Project Option: 1.12.2 – Expansion of Behavioral Health Outpatient Services for Children, Families and Adults
Unique Project ID: 137252607.1.2 (Pass 2)

Performing Provider/TPI: Dallas County MHMR dba Metrocare Services/ 137252607

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: To create a community mental health clinic located in Grand Prairie to provide behavioral health services to the underserved in that area. Services will include psychiatric evaluations, pharmacy services, counseling, rehabilitation and skills training and case management. The type and volume of services provided to a client will be determined by information collected during the initial psychiatric evaluation, including patient reported needs on the Child and Adolescent Needs and Strengths Assessment (CANS) and the Adult Needs and Strengths Assessment (ANSA).

Need for the project: The Region 9 Community Assessment reports "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our area. Further, the RHP identifies the need for "development of lower levels of care in order to prevent the need for high-cost services" in our community. By operating an additional community based mental health clinic, Metrocare will expand access to behavioral health services to the underserved in Dallas County.

Target population: The mental health clinic will provide treatment services to children, youth, families and adults. Metrocare estimates that 56% of the people served through this clinic will be indigent patients and 44% of the clients served will be insured by Medicaid.

Category 1 or 2 expected benefits: The goals of this project include:

- Increase the number served of patients served each year (DY 2- 250, DY 3-500, DY 4-750, DY 5-1000)
- Increase the percentage of patients report satisfaction with services at Grand Prairie clinic (DY 3 – 70% / 350 clients, DY 4 – 75% / 563 clients, DY 5 – 80% / 800 clients) as measured by the Consumer Assessment of Healthcare Providers and Systems (CAHPS)

Category 3 outcomes: The goals of this project include:

- DY 4 - 70% of patients served will report improved Quality of Life (IT-10.1) as measured by the Child and Adolescent Needs and Strengths Assessment (CANS) and the Adult Needs and Strengths Assessment (ANSA)

- DY 4 – 80% of patients served will report improved Quality of Life (IT-10.1) as measured by the CANS and ANSA

Project Description

Expand the number of community based settings where behavioral health services may be delivered in underserved areas

As identified in the Community Needs Assessment for Region 9, "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our area (Collins, 2012.RHP 9: Community Needs Assessment Report). To combat this ever growing problem, Metrocare Services will create an additional community mental health clinic located in Grand Prairie to provide mental health treatment to the underserved living in that area. The site will provide treatment services to children, youth, families and adults. To begin operations, the clinic will be staffed with one psychiatrist, registered nurse, pharmacist, pharmacist technician, licensed clinician, qualified mental health professional and business support staff. Treatment services offered at each clinic will include psychiatric evaluations, pharmacy services, counseling, rehabilitation and skills training and case management.

Collaboration

This project is being proposed through a collaboration agreement. The specific collaboration arrangement for this project is set forth below.

Collaborators	**DY2**	**DY3**	**DY4**	**DY5**	**Total**
Parkland Memorial Hospital	485,135	127,511	35,806	80,497	728,949
Project / Collaboration	**DY2**	**DY3**	**DY4**	**DY5**	**Total**
Category 2 Project Value	2,089,713	1,616,030	1,636,304	1,470,349	6,812,396
Related Category 3 Projects Value	179,550	181,812	367,587	728,949	427,821
Total Project Value	**2,269,263**	**1,797,842**	**2,003,891**	**2,199,298**	**7,240,217**

The collaboration involves the transfer of Pass 2 allocated dollars from Parkland Memorial Hospital (public entity) to the performing provider (public entity). The combined project value for this project exceeds the funding provided by the collaborating entity.

The collaborating parties have joined together in this collaboration with the belief that the goals of this project are valuable and will contribute to regional transformation.

Goals and Relationship to Regional Goals

The goal of this project is to expand underserved consumers' access to behavioral health services by opening a community outpatient clinic in Grand Prairie. By expanding access to treatment, these consumers increase their ability to participate in services in their community

and through these services may decrease the need for expensive interventions such as hospitalization, residential treatment and criminal justice involvement. The National Association of Mental Illness identifies that "lack of community services results in significantly overcrowded emergency rooms and inappropriate use of prisons as warehouses for people with mental illness" (NAMI, 2009. Grading the State 2009 Report: TX). Furthermore, the Region 9 Community Needs Assessment reports providers in Dallas County need to develop lower levels of care in order to prevent the need for high-cost services (Collins, 2012). There is a correlation between increased utilization of not only expensive behavioral health services, such as residential treatment, but also costly medical treatment including hospitalization when mental health issues are not treated. For Dallas County specifically, the presence of a "co-occurring behavioral health condition is associated with increased case severity of medical encounters and a 36% increase in the average charges per encounter" (Collins, 2012). Lastly, the North Texas Behavioral Health Authority conducted a survey and identified transportation as one of the major barriers to accessing needed services (Collins, 2012). By operating clinics in Grand Prairie, where there is no public transportation system, Metrocare is expanding access to thousands of potential clients who have historically struggled to receive services.

Challenges

According to a recent analysis of the Texas Public Behavioral Health System, Texas ranks last nationally among all states in mental health funding and relies too heavily upon a system of emergency services versus promoting recovery and prevention through a system of community based care (Public Consulting Group, 2011). Limited funding forces a behavioral health system to focus on crisis services to meet immediate need and does not allow for sufficient provision of preventive or maintenance care. Unfortunately, this focus on crisis intervention with limited follow up services creates an ineffective cycle where clients engage in services only when in crisis and do not participate in ongoing services that can aid a client to improve overall functioning and decrease dependency on those emergency services. Furthermore, the PCG (2011) acknowledges in its report that our reliance upon "spending millions of dollars in mental health and substance abuse services within the county jail and other law enforcement agencies is symptomatic of our inadequate community based system of care." Research conducted by the Texas Department of State Health Services (2010) found that many clients who received services outlined in a traditional RDM Service Package as a jail diversion strategy reported "clinical benefits including decreased risk of harm, decreased need for support, fewer psychiatric hospitalizations, decreased functional impairment, decreased employment problems, decreased housing instability, and decreased co-occurring substance abuse." Regarding children and adolescents, research reveals that "mental health services available to children are limited" and services "oftentimes do not include the family-focused and comprehensive approach needed to adequately address client issues" (Collins, 2012). In addition, the need for publicly funded mental health services for youth has grown significantly in the last 10 years with the majority of intensive services for youth provided by the juvenile justice system (Collins, 2012). The lack of early intervention and consistent treatment at the community level can result in expensive treatment that often involves separation from immediate family. Furthermore, research reveals that effective treatment for children must be

a comprehensive approach that addresses all areas of the child and family's lives; an intervention that is much easier and effectively implemented at a community level versus institutionalization (Blader, Joseph 2003).

Evidenced based research consistently demonstrates that community based outpatient care is a beneficial and cost effective therapeutic approach to treatment. By opening an additional clinic in an underserved area of Dallas County, Metrocare is helping to address the challenges identified here; enhancing access to behavioral health services that can improve quality of life and result in less dependence upon higher levels of care.

5-Year Expected Outcome for Provider and Patients

- Develop administrative protocols and clinical guidelines for new clinic
- Hire and train staff to operate and manage clinic
- Establish behavioral health services in new community-based clinic in underserved area
- Evaluate and continuously improve services
- Improved Consumer satisfaction with Access

Starting Point/Baseline

Baseline for measures is zero.

Rationale

The Region 9 Community Assessment reports "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our area (Collins, 2012). Further, the RHP identifies the need for "development of lower levels of care in order to prevent the need for high-cost services" in our community (Collins, 2012). The impact of scarce community based treatment is profound, influencing all aspects of a client's life and the greater community. To begin, unmet mental health needs greatly affect a person's ability to properly care for their medical needs and can result in increased cost to taxpayers for potentially preventable medical illnesses. For Dallas County, the presence of a "co-occurring behavioral health condition is associated with increased case severity of medical encounters and a 36% increase in the average charges per encounter (Collins, 2012). Lack of community based services also results in "significantly overcrowded emergency rooms" for people seeking crisis services and "inappropriate use of prisons as warehouses for people with mental illness" (NAMI, 2009). According to the Region 9 Community Assessment, 27% of all book-ins to Dallas County jail are currently referred to behavioral health services within the jail" (Collins, 2012). In addition, homeless individuals with behavioral health conditions "cost 3 times as much and are booked into jail 2 times as often as the general Northstar population" (Balfour, 2011). By providing case management services to clients in our community based clinics, Metrocare can assist consumers to stabilize and improve functioning; resulting in less dependence upon higher levels of care. Lastly, NTBHA identified transportation as one of the major barriers to

individuals accessing services (Collins, 2012); by launching a community based clinic in Grand Prairie, where there is no public transportation system, Metrocare will expand access to behavioral health services for potentially thousands of Dallas County residents.

The new clinic will serve children, youth and families in addition to adults. The need for publicly funded mental health services for youth has grown significantly in the last 10 years with the majority of intensive services for youth provided by the juvenile justice system (Collins, 2012). The lack of early intervention and consistent treatment at the community level can result in expensive treatment that often involves separation from immediate family. Furthermore, research reveals that effective treatment for children must be a comprehensive approach that addresses all areas of the child and family's lives; an intervention that is much easier and effectively implemented at a community level versus institutionalization (Blader, Joseph 2003). In summary, Metrocare Services is the largest provider of mental health services in Dallas County. We serve approximately 10,000 people diagnosed with a mental illness each month. By operating an additional community based mental health clinic, Metrocare will expand access to behavioral health services to the underserved in Dallas County. Evidence based research reveals the need for additional community based programs and outcomes demonstrate that these programs are effective and cost beneficial to the greater community. To ensure success towards our goal, Metrocare chose milestones and metrics that are relevant to project development; training of staff; operating the clinic; and continuously evaluating operations for expanding access and provision of quality services.

Project Components

There are no project components from Project Option 1.12.2

Unique community need identification numbers the project addresses

CN.5 – Behavioral Health
CN.6 – Behavioral Health and Primary Care
CN.7 – Behavioral Health and Jail Population

How the project is a significant enhancement to an existing delivery system reform initiative

This project will significantly enhance access to behavioral health services by expanding the number of community based settings in an underserved area in Dallas County.

Related Category 3 outcome measure

- IT 10.1 Quality of Life/Functional Status

The Category 3 Improvement Target regarding improved quality of life/functional status (IT 10.1) is the related improvement outcome to this project. By measuring a patient's improved quality of life, Metrocare will assess the effectiveness of the services offered at the clinic in

assisting the client to meet his/her treatment goals. The Child and Adolescent Needs and Strengths Assessment and the Adult Needs and Strengths Assessment were chosen as the standardized tools to measure Quality of Life as both tools have demonstrated reliability and validity and will allow Metrocare to monitor for progress towards improved quality of life throughout a client's participation in services.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance behavioral services:

137252607.1.1	Metrocare – Workforce Enhancement
137252607.2.1	Metrocare – Integrate primary care and behavioral health
137252607.2.2	Metrocare – ACT (Assertive Wrap-around Program)
137252607.2.3	Metrocare – Family Preservation
137252607.2.4	Metrocare – Center for Children with Autism
137252607.2.5	Metrocare – Day Program

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Learning Collaborative - We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Metrocare Services determined the value of each project by comparing the budgeted cost of the specific project against the cost to the community should the services go unprovided. Costs associated with emergency room visits, hospitalization, arrest, detention and residential treatment were factors in determining the value of this project. It is estimated that participation in outpatient services, as defined as minimum of three months of consecutive treatment, will result in less than 20%of those served seeking higher levels of care for psychiatric needs or involved in the criminal justice system. Metrocare will collaborate with Parkland Hospital regarding the referral of individuals for behavioral health services. The Center will also be an active member in community initiatives for the learning collaborative.

Project Option 1.13.1 – Development of behavioral health crisis stabilization services as alternatives to hospitalization (Crisis Respite Behavioral Support Wraparound Program)

Unique Project ID: 121988304.1.1
Performing Provider Name/TPI: Lakes Regional MHMR Center/121988304

Provider: Lakes Regional MHMR Center is a community-based provider of out-patient services to adults with serious mental illness, chemical dependency; to children and adolescents with serious mental illness or emotional disorders; to persons with autism, pervasive developmental disorders or intellectual disabilities; and to infants and toddlers with developmental delays. Lakes Regional MHMR Center's service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. The service area crosses four Regional Healthcare Partnership (RHP) areas and is mostly rural. Lakes Regional's community programs serve 9,500+ individuals each year and 95% of our consumers are Medicaid eligible or indigent.

Intervention(s): Lakes Regional will develop a behavioral health crisis stabilization service for dually diagnosed individuals with intellectual/developmental disabilities, autism spectrum disorders and behavioral health needs as an alternative to hospitalization, including a crisis respite facility, and wraparound services to serve Kaufman County and surrounding counties. This project intervention is new: there are no other alternative crisis stabilization services or wraparound services for the targeted population in the proposed service area.

Need for the project: There is currently a lack of provider capacity that will serve the Medicaid and indigent population for these behavioral health and other specialty services. The region is looking for ways to feasibly and effectively improve provider capacity and access to crisis alternative services (specialists) for remote populations/ communities. Our project is focused on the provision of crisis respite with wraparound services, and health and wellness services for the target population (low income, rural areas of Kaufman and surrounding counties). Currently there is no community-based crisis alternative service in this region, which leads to overuse of emergency departments, hospital and institutional settings unnecessarily.

Target population: The target population is dually diagnosed individuals with intellectual/developmental disabilities, autism spectrum disorders and/or behavioral health needs, who require specialty consultation (i.e., psychiatry, certified behavioral analysts, counseling, nursing, therapy, and other specialty services consults). We estimate serving a minimum of 250 clients over the waiver period. Approximately 95% of our patients are either Medicaid eligible or indigent, so we expect they will benefit from the availability of crisis alternative services.

Category 1 or 2 expected patient benefits:
The benefits include improved patient outcomes such as reducing recidivism and unnecessary ED visits. Wrap Around Behavioral Support Services will utilize a multi-disciplinary treatment team model to provide interventions that will increase the individual's ability and likelihood to deescalate effectively during crisis; particularly when those interventions are provided in a

natural and less restrictive environment. Process milestones listed for the project are designed to establish baseline need for a crisis services alternative in the region, to gather data on the current community crisis system and to design a program that is tailored to the needs of the target population with IDD/ASD/MH. The expected patient benefit will reduce the use of services that have limited or no abilities to provide Dual Diagnosis (IDD/MH) treatment. The project seeks to minimally serve 250 dually diagnosed individuals in DY4 and DY5.

Category 3 outcomes: IT-6.1 The project goal is to achieve a 60% improvement overall by DY5 in patient satisfaction with health status/functional status related to improving access to care, quality of care, and health outcomes, as well as improving overall health for the target population.

Project Description

Lakes Regional will develop a behavioral health crisis stabilization service as an alternative to hospitalization by establishing a community-based program to provide a continuum of services, including a crisis respite facility, and wraparound services to serve Kaufman and surrounding counties. The program will include an intensive and interdisciplinary behavioral response team to provide comprehensive wraparound services and interventions to high risk clients who are dually diagnosed with Intellectual and Developmental Disabilities/Autism Spectrum Disorder and Mental Health diagnosis (IDD/ASD/MH), or have other co-occurring disorders and/or medical needs. These interventions will involve developing and implementing crisis stabilization services to address the identified gaps in the current community crisis system. By developing crisis/respite residential treatment, individuals in crisis will receive appropriate, cost effective care at the right time and the right place by specialty behavioral health providers. Based on assessed levels of need and risk, the team would provide in-home consultation, specialty psychiatric services/telemedicine, skills training, family education, treatment planning, monitoring and referrals to needed services to ensure that high risk individuals remain in the least restrictive environment in the community. In addition, a Crisis Respite Treatment site would be established to stabilize referred individuals in crisis or in danger of out of home placement and/or psychiatric hospitalization. A key component of this project is extensive on-going training in Applied Behavioral Analysis to team members/caregivers and significant others to avoid acute crisis events and assist in stabilizing individuals in their home. The team will receive training in providing culturally competent care, and interpretation services would be available and transportation, as needed.

Goals and Relationship to Regional Goals

The goals of this project are: 1) to improve access to appropriate crisis alternatives by providing a crisis stabilization program with wraparound services, including the availability of translation and transportation services; 2) to improve patient satisfaction with physical and behavioral health outcomes through the use of early intervention and intensive wraparound services. Presently there is no short term crisis respite or clinic in this rural county (Kaufman) in Region 9 that offers comprehensive wraparound services for the IDD/ASD/MH populations.

The project relates to the Region 9 goals to improve access to behavioral health services and to reduce the unnecessary use of Emergency Department services (CN.5, CN.7, CN.12) The project relates to improving access to care and improving overall quality of care for the targeted safety net population, and lowering cost of care by decreasing emergency department services.

Challenges

Based on a recent Stakeholder meeting, participants noted a significant and costly delay in moving individuals from the State Psychiatric Hospital into the community. Additional feedback indicated that individuals who are dually diagnosed experience barriers to care in more structured settings due to the status of being dually diagnosed with IDD/MH. Reportedly there is a significant and costly delay in the time it takes for an individual in crisis to be assessed by behavioral health crisis teams, and in some circumstances, not being assessed at all due to their dually diagnosed status. In this geographic rural area crisis teams are not always available on a timely basis. The Stakeholders also identified the lack of availability of care before 8 am and after 5 pm a significant barrier to access to care.

The 2010 Annual Survey of Hospital Tracking Data for Kaufman County listed 32,086 Emergency Department visits respectively. A number of these ER visits may have included the specialty population targeted by this project. Kaufman County is designated as an official Mental Health Professional Shortage Area[106]. The region lacks key community-based alternatives to costly and unnecessary emergency commitments and ED visits for the target population, while 24% of the population in the region reports having had a mental health occurrence related to stress or depression lasting longer than 5 days, and 40% making less than $25,000 per year in the region. 31.5% of African Americans and nearly 30% of Hispanics in the region are reportedly vulnerable to behavioral health risk factors[107]. The project will target IDD/ASD/MH individuals at risk for high utilization of ER services due to behavioral challenges and divert them to a community-based crisis alternative service at half the cost of hospitalization or institutionalization[108]. Stakeholders also identified post-jail care is not available or delayed which increases the rate of recidivism.

5-Year Expected Outcome for Provider and Patients

The 5 year expected outcome of this project is to provide an increase in utilization of appropriate crisis alternative in DY5 by 250 individuals. The expected result will be a significant decrease in preventable behavioral health events that typically result in hospitalization, incarceration and institutional care for individuals with IDD by deescalating crises in the natural environment with Wrap Around Behavior Support Services. The patient benefit is the promotion of self-management of challenging behaviors for the target population in the community, and significant reductions in the overall cost of care by utilizing a seamless system

[108] http://www.ncbi.nlm.nih.gov/pubmed/8678177, Day Hospital/Crisis Respite Care vs. Inpatient Care, Am J Psychiatry. 1996 Aug; 153(8):1074-83.

of care. The availability of nursing services within the crisis-respite team will facilitate integrated care to address fragmentation and discontinuity of health care, resulting in improvement of patient satisfaction and outcomes[109] Research has shown that the use of Intensive Case Management reduced the number, confidence interval and duration of inpatient admissions, reducing the number of reported needs and increasing patient satisfaction, as well as the cost of care borne by the health sector[110]. The outcome will be improvement in overall life satisfaction and ability to live independently for the target population/service recipients.
Projected patient impact by DY is as follows:
DY2 – Stakeholders will benefit from availability of an analysis of community needs for crisis services with identified gaps in the current system.
DY3 – Stakeholders will benefit from a program designed to tailor to the crisis needs of the identified population in the local community.
DY4 – 100 individuals will have access to utilization of appropriate crisis alternatives in the community.
DY5 – 150 additional individuals will have access to utilization of appropriate crisis alternatives in the community.

Starting Point/Baseline

Number of clients –The baseline for the project is to be established, since it will be a new program. The target population includes individuals (children and adults) in Kaufman County with IDD and co-occurring, mental and behavioral disorders. There are currently approximately 1100 individuals being served in this county by the public MH provider and by the IDD Local Authority. Additionally, more than 200 IDD individuals are currently being served by private waiver providers in the target area, creating a sizable potential ongoing target population for the project. With the addition of referrals from school districts, and Community Resource Coordination Groups (CRCGs), the number of targeted individuals to be served potentially in the program is 250 for the various program interventions within the project scope over the waiver period. Lakes Regional's internal data indicates that approximately 65% IDD/ASD-diagnosed clients in their counties have a psychiatric diagnosis, or receive psychotropic medication for psychiatric symptoms. Currently we have one provider trained in the project; a board certified behavior analyst (BCBA). The project calls for 12 additional professional staff to be hired.

Rationale

According to the RHP Protocol, "when a consumer lacks appropriate behavioral health crisis resolution mechanisms, first responders are often limited in their options to resolve the

[109] Jansen, D., Krol, B., Groothoof, J. and Post., D. (2006). Towards improving medical care for people with intellectual disability living in the community: possibilities of integrated care. *Journal of Applied Research in Intellectual Disabilities.* 19: 214-218.
[110] Hassiotis. A. (2002). Community mental health services for individuals with intellectual disabilities: issues and approaches to optimizing outcomes. *Disability Management and Health Outcomes* 10 (7): 409-417.

situation. Sometimes the choice comes down to the ER, jail or an inpatient hospital bed. Crisis stabilization services can be developed that create alternatives to these less desirable settings"

For the IDD/ASD/MH population, this problem is intensified due to an even greater limitation on settings that are available and appropriate for managing crisis. Kaufman County is designated as an official Mental Health Professional Shortage Area, and MHMR Centers are lacking provider capacity, as well as staff trained in providing culturally competent care with over 40% of the population in the region being African American or Hispanic. With the opportunity to develop behavioral health crisis stabilization services the target population will:

- Receive behavioral health management interventions through the provision of comprehensive wraparound services;
- Have access to a community-based interdisciplinary intensive behavior supports response team hired and trained in cultural competence to decrease barriers to care;
- Have access to nursing services within the crisis/respite team in addition to a psychiatrist, improving physical and mental health outcomes;
- Have access to early intervention and crisis services, enabling them to be better equipped for crisis situations, thus avoiding unnecessary and costly ED visits and inpatient treatment.

Project Components

Currently there is no community-based crisis alternative service in this region. To determine the need and appropriateness of the intervention, the project involves these core components:

a) Convening community stakeholders to conduct a gap analysis of the current community crisis system, and to develop a specific action plan to address the identified gaps -- this will allow the project to establish a baseline of need
b) Analysis of the current system of crisis stabilization services available in the community – this will allow the project to establish a baseline of need and design of a program that fits the needs of the target population in the local area;
c) Assessing the behavioral health needs of the target population with IDD/ASD/MH currently receiving crisis services in a variety of settings to:
    - Determine types/volume of services needed to resolve crises in community-based settings
    - Conduct gap analysis that results in a data-driven plan to tailor community-based crisis stabilization alternative services to the needs of the target population.
d) The project has identified the community-based crisis respite model with wraparound services, including telepsychiatry, nursing services, BCBA services, service coordination, community supports/skills training, short-term day habilitation, assertive community

treatment (ACT) and intensive case management, which are an evidence-based practice that ensures medication and treatment adherence, and links the patient with resources[111]. The wraparound crisis and ACT model is a highly researched evidenced approach for delivering behavioral health services; it is listed in the Texas Administrative Code, Community Standards, and Best Practices.

e) The project will also involve sharing and disseminating findings to other agencies, providers and stakeholders in the region, including: reviewing the impact of selected evidence-based interventions on access to and quality of behavioral health crisis stabilization services, as well as lessons learned and key challenges in expanding the interventions to a broader population.

Rationale for selecting outcome measures

Process milestones listed for the project are designed to establish baseline need for a crisis services alternatives in the Region, to gather data on the current community crisis system and to design a program tailored to the needs of the target population with IDD/ASD/MH.
Process milestones also encompass hiring of staff and creation of policies and procedures prior to program implementation. Improvement milestones address measurement of an incremental increase in utilization of the program in DYs 4 and 5. Metrics in DYs 4 and 5 will measure an increase in utilization of the program by a minimum of 250 individuals at the completion of DY5.

Specify the unique community need identification number the project addresses:

CN.5 - Behavioral Health
CN.7 – Behavioral Health and Jail Population
CN.12 – Emergency Department Usage and Readmissions

How the Project represents a new initiative

This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

IT-6.1 Percent improvement over baseline of patient satisfaction scores measuring patient's overall health status/functional status. (Stand-alone)
Research has shown that there is a much greater instance of health problems in the IDD population[112]; the program staff will monitor mental and physical health status and outcomes

[111] Kolbasovsky, A., Reich, L, Meyerkopf, N. (2010). Reducing six-month inpatient psychiatric recidivism and costs through case management. *Care Management Journals* 11: 2-10. DOI; 10. 1891/1521-0987. 11.1.2.
[112] Jansen, D., Krol, B., Groothoff, J. and Post, D. (2004). People with intellectual disabilities and their health problems: a review of comparative studies. *Journal of Intellectual Disability Research* 48 (2): 93-102.

to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population[113]. Research has shown that the use of Intensive Case Management reduced the number, confidence interval and duration of inpatient admissions, reducing the number of reported needs and increasing patient satisfaction, as well as the cost of care borne by the health sector[114]. These projected outcomes relate to improving access to care, quality of care, and health outcomes, as well as improving overall health for the target population. The CG-CAHPS survey produces ". . . comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers"[115]. Sharing survey results with other agencies and providers in the region regarding consumer satisfaction with overall health and functional status will bring about improvements in the overall health system for individuals with IDD/ASD/MH; sharing survey results with stakeholders will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and follow-up to care.

Relationship to Other Projects:

1.7 Telemedicine Project – The Lakes Regional telemedicine project will allow access to remote provider services, psychiatric counseling and primary care services. Telemedicine technology will be utilized as an integral focus of the provision of care proposed in the Crisis Stabilization project.
Related Category 4 Population-focused improvements: N/A

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative
Our agency will play an active role in the development and ongoing conduct of Project Learning Collaborative, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We also will participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that will enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project. Tarrant County MHMR is proposing a similar project to the same target population for Crisis Avoidance; Pecan Valley MHMR is also providing crisis respite as an aspect of a project in collaboration with their internal behavioral health provider. Lakes Regional has been participating in collaborative teleconference calls with the other MHMR providers in various regions to share resources and best practices surrounding this expansion, and will propose to continue this collaboration in some capacity pending project funding and implementation.
With our established network of support to share resources, Lakes Regional proposes to further

[113] Jansen, D., Karol, B., Groothoof, J. and Post D. (2006). Towards improving medical care for people with intellectual disability living in the community: possibilities of integrated care. *Journal of Applied Research in Intellectual Disabilities.* 19: 214-218

this collaboration in some capacity pending project funding and implementation and develop collaborations with private providers, correctional and emergency departments in the region.

Project Valuation

Currently, there is no community-based alternative crisis service for the dually diagnosed IDD/ASD/MH target population (children and adults) in Kaufman County. This project is designed to enhance the quality of life of individuals in the target population by providing culturally competent wraparound services to 1)improve access to appropriate crisis alternatives in the community by providing a crisis stabilization program with wraparound services (including the availability of translation and transportation services); 2) improve patient satisfaction with behavioral health and physical health outcomes for the target population through intensive wraparound services and 3) decrease unnecessary utilization of ED and higher levels of care, reducing overall cost of care. These goals will be accomplished via the collaborative involvement of providers in the public behavioral health system, private waiver providers, physical health and the developmental disabilities service system, resulting in potentially a significant decrease in preventable behavioral health events that typically result in hospitalization, incarceration and institutional care for the target population. The anticipated valuation addresses a priority need in the community that allows for cost avoidance, supporting individuals in the community at a lesser cost than institutional care, avoiding costs in emergency rooms, psychiatric hospitals and the criminal justice system. The project also addresses the barrier to care related to lack of transportation in a large, primarily rural geographic area by providing access to transportation to critical community resources.
Size factor: There are currently approximately 1100 individuals with IDD being served in these counties by the public MH provider and by the IDD Local Authority. Currently there is no crisis respite alternative program in the Region 9 area. With 30 to 35% of IDD individuals estimated to have a psychiatric disorder and with the additional projection of 200 IDD individuals being served by private waiver providers in the target area, the number of targeted individuals to be served potentially in the program would be a minimum of 250 over the waiver period. Performing providers in Region 9 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 9 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Lakes Regional MHMR has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B. In addition, this project was valued based on studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: "Valuing the Program to Create an Assertive Community Treatment (ACT) Team for People with Intellectual and Developmental Disabilities (IDD)" and "Valuing the Crisis Respite for Children Program." These studies were completed through a contract with Center for Health Care Services. These valuation studies used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency room visits that are avoided). Complete write-up of project research is available at provider site.

Total valuation of project is $6,421,691.

Project Option 1.7.1 – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region.

Unique Project ID: 121988304.1.2
Performing Provider Name/TPI: Lakes Regional MHMR Center/121988304

Provider: Lakes Regional MHMR Center is a community-based provider of out-patient services to adults with serious mental illness, chemical dependency; to children and adolescents with serious mental illness or emotional disorders; to persons with autism, pervasive developmental disorders or intellectual disabilities; and to infants and toddlers with developmental delays. Lakes Regional MHMR Center's service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. The service area crosses four Regional Healthcare Partnership (RHP) areas and is mostly rural. Lakes Regional's community programs serve over 9,500 individuals each year Over 95% of our consumers are either Medicaid eligible or indigent.

Intervention: This project will implement telemedicine and telehealth services to provide consultations and increase capacity for behavioral health and other specialty provider services to the Medicaid and indigent target population.

Need for the project: There is currently have a lack of provider capacity that will serve the Medicaid and indigent population for these behavioral health and other specialty services. The region is looking for ways to feasibly and effectively improve provider capacity and access to services (specialists) for remote populations/ communities. Our project is focused on the expansion of behavioral health services (psychiatric and behavioral specialists), and health and wellness services for the target population (low income, rural areas of Rockwall County).

Target population: The target population consists of our clients needing specialty consultation (i.e., psychiatry, certified behavioral analysts, counseling, nursing, therapy, and other specialty services consults. Approximately 95% of our patients are either Medicaid eligible or indigent, so we expect they will benefit from the majority of the consults. We estimate that Lakes Regional will serve 210 patients over the course of the waiver period. This project will provide access to services (specialists) for remote populations/communities specifically targeting these services to Medicaid and indigent clients in rural areas of Kaufman County.

Category 1 or 2 expected patient benefits: The project seeks to provide for a minimum of 210 individuals for telemedicine e-consultations with a specialist over the course of the waiver and to maintain an annual increase tend of 40% (over baseline) for the numbers of patients served.

Category 3 outcomes: IT-6.1 Patient Satisfaction
The projected outcomes relate to an improvement in patient satisfaction and functional status. By the end of the waiver, our goal is to achieve 60% improvement overall by DY5 in patient satisfaction with health status/functional status related to improving access to care, quality of care, and health outcomes, as well as improving overall health for the target population.

Project Description

There currently exists a significant gap in behavioral health (psychiatric specialist referral services), and health and wellness services being provided in many Texas counties. Included among the listed counties is Kaufman and as of March 25th, 2011, these counties have been Federally Designated as Mental Health Professional Shortage Areas[116] . Lakes Regional MHMR Center proposes to reduce this gap and significantly improve patient access to these services (identified as needed in the Region for Kaufman County) with the implementation of telemedicine/telehealth technology. This technology uses electronic information and telecommunications to support a wide array of clinical health care services over long distance. These services include specialist referral services such as psychiatric care, patient and professional health-related education, and public health and administration. This approach in providing access to these services is a cost effective alternative to face to face communication, especially for individuals in remote/rural areas where access is difficult and/or unavailable. The planned telemedicine/ network technology for this project will include the deployment of high definition video/audio equipment, Virtual Private Network (VPN) internet cloud based connectivity and server based video session management technology. Server based telemedicine/ telehealth technology will allow for the management of multiple client/specialist sessions and the internet cloud connectivity will enable sessions between many different provider sites and mobile devices. The implementation plan includes quality improvement measures and "lessons learned" approach to making corrections and improvements to the program. Quality control methodologies and data analysis will be utilized to effectively manage the expansion of the program to the service areas where the population has the greatest need. Successful implementation of this technology will open the door for Lakes Regional to provide more flexible and timely delivery of needed health care and specialist services to individuals in rural areas of Kaufman County.

Goals and Relationship to Regional Goals

Specific goals for this project include: 1.) Successful planning and implementation of a telemedicine/ telehealth infrastructure program to provide and enable expansion of behavioral health services (including psychiatric specialist referral services), and health and wellness services with improved, flexible, and cost effective access to these services needed in Kaufman County. 2.) Continuous improvement in the quality of the technical functionality and processes of the telemedicine/telehealth system with a program of monitoring and analysis of the delivery system performance. 3.) Measurable and continuing improvement in the clinical processes of the telemedicine/telehealth program with clinical data tracking and analysis to show the expansion of access to specialty services, improvement in clinical outcomes, increasing patient satisfaction with the services they receive, and a 40% annual increase trend (DY4, DY5) for the number of individuals served and seeing a specialist over the DY3 established start-up baseline.

[116] U.S. Department of Health and Human Services Shortage Designation Branch (http://bhpr.hrsa.gov/shortage/)

As of March 25th, 2011, Kaufman has been identified (along with other counties in Texas) as Federally Designated as Mental Health Professional Shortage Areas[117]. Lakes Regional MHMR Center would like to close this gap and significantly improve patient access to these needed services with the implementation of telemedicine/telehealth technology. Lakes Regional is confident that the implementation of telemedicine/telehealth technology will work exceedingly well for the expansion of behavioral health services (including psychiatric specialists), and health and wellness services needed in Kaufman County. A needs assessment/ services gap analysis (our first project process-milestone) will be conducted to provide the information necessary for Lakes Regional to determine infrastructure requirements and the appropriate types and level of services (specialists and others) needed for the region and a successful telemedicine/telehealth start-up and expansion program.

The region is looking for ways to feasibly and effectively improve provider capacity and access to services (specialists) for remote populations/ communities. Our project is focused on the expansion of behavioral health services (psychiatric specialist), and health and wellness services for the target population (low income, rural areas of Kaufman County. By improving services access, quality of care and the clinical outcomes, the region anticipates a reduction in emergency room utilization and an overall cost savings for the region. Our telemedicine/ telehealth project will implement a means to move past current barriers towards helping the region achieve these goals. Lakes Regional has already successfully improved access and reduced costs by utilizing this technology in some of the larger clinics and with this experience will move the technology into the region for the more rural areas of Kaufman County. The application of this technology is very flexible and will provide the means to achieve changing service provider objectives for the region as the current needs for these communities are assessed. The program will allow connectivity between all kinds of service providers including doctors' offices, hospitals, specialty clinics, law enforcement and crisis care providers such as respite clinics with wrap-around services for IDD (another Lakes Regional implementation project). According to several studies[118], there have been upwards of 50 different medical subspecialties successfully served via telemedicine and the number is growing. These new services will help to reduce emergency room visits and the need for hospitalization by getting crucial /crisis care and preventative care where it is needed in the region.

Challenges

The use of telemedicine/telehealth technology for the expansion of behavioral health services (including psychiatric specialists), and health and wellness services has not yet been fully explored by Lakes Regional in Kaufman County. The number of individuals in need of specialist psychiatric and other services in the more remote penetration area around current Lakes Regional offices has not been established. A thorough needs assessment/services gap analysis (our first project process-milestone) will be conducted to provide the information necessary to

[117] U.S. Department of Health and Human Services (http://hpsafind.hrsa.gov/)
[118] American Telemedicine Association (http://www.americantelemed.org/i4a/pages/index.cfm?pageid=3333)

determine infrastructure requirements and the appropriate level and types of services needed from the telemedicine/ telehealth start-up and expansion program. Currently, many specialist type consultative services and the opportunities for ensuring clinical preparedness in Kaufman County are limited by fiscal, travel time and distance costs. Also, the technology for the data lines currently deployed for the Lakes Regional core network in Kaufman County have very limited bandwidth (T1 level and below). The data transfer speeds between sites and is slow and very limited for an effective deployment of high definition, internet cloud and server based telemedicine/telehealth technology. Successful implementation of the telemedicine/ telehealth technology will require infrastructure improvements including the latest advancements in technology for telemedicine/ telehealth hardware and server based software. Data network improvements will include high speed data transmission through the deployment of VPN internet cloud capabilities and mobility options. Completion of the necessary analysis and implementation of the required improvements will insure our success with being able to meet the clinical and technological challenges for this project.

5-Year Expected Outcome for Provider and Patients

Through the implementation of this telemedicine/telehealth project, Lakes Regional expects 5-year outcomes to include: 1.) Expanded access to behavioral health services (including psychiatric specialist referral services), and health and wellness services for the target population (low income, rural areas of Kaufman County). The projected outcome for the second half of DY-5 is an 80% improvement over baseline (established in the second half of DY-3) in the number of individuals in the target population gaining access to a specialist/ specialist services. 2.) Continuous quality improvement effort in the technical and clinical processes with documented improvement in the satisfaction of individuals receiving services over base-line/ start-up results.

Starting Point/Baseline:

Lakes Regional has experience with providing services through telemedicine; however we have not implemented or expanded the program into Kaufman County. Providing these telemedicine/ telehealth services in the region will be a start-up program and baseline data for the quality of services and the expansion of the kinds of services provided and the number of individuals served will need to be established. We will begin providing specialist services via telemedicine during the 2nd half of DY-3 and are setting our baseline at a minimum of 30 individuals/e-consultations with a specialist during that period. As soon as our implementation and assessment phase is completed, we will begin data collection to capture ongoing data in many areas of the program. After the first six months of providing specialist services, we will have actual numbers from which quality improvement metrics will be measured against.

Rationale

One of the biggest challenges facing the U.S. healthcare system is to provide quality care to the areas that are currently underserved and lacking access to specialty physicians due to geographic and socioeconomic conditions. With the implementation of a telemedicine/telehealth infrastructure/ program, we are confident that Lakes Regional MHMR Center will be able to close a significant gap in behavioral health (including psychiatric specialist referral services), and health and wellness services being provided for individuals in need that live in rural areas of Kaufman County. The timeframes for implementation and management of the new telemedicine/telehealth program are well within our capabilities. The project milestones and metrics are based on the telemedicine/telehealth program infrastructure deployment, the introduction of new and specialty services and the corresponding growth and continuous improvement in the quality of those services (technically and clinically). With successful implementation of the telemedicine/telehealth program, we plan to reach and exceed the goals we have set for the introduction of new services, service locations, and improvement in the quality of our services and the number of individuals served. The technology will provide the needed flexibility with how and where we provide services. This flexibility will contribute to our growth and after metric baselines are established, we intend to have a significant annual growth rate for the number of telemedicine/telehealth e-consultations/visits for individuals in need while continuously improving the quality of the program. We expect the growth to be significant with an increase of 80% over baseline numbers for the 2nd six months of DY5 for the number of Telemedicine/ Telehealth specialist e-consultations/visits for individuals. Along with our growth, our daily monitoring of the program will enable us to continuously improving the management and quality of the services we provide.

Project components

The selected project components are in line with the 5 year goals we have set and are achievable from our starting point within our planned timeframes. The core project components for Project Option 1.7.1 – "Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the region" are as follows:

a. Provide patient consultations by medical and surgical specialists as well as other types of health professionals using telecommunications.
b. Conduct quality improvements using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Our project milestones and metrics are based on the telemedicine program infrastructure deployment and the introduction of new and specialty services along with the planned growth

and continuous improvement in the quality of those services (technically and clinically). Successful implementation of the telemedicine/telehealth project plan will enable Lakes Regional to reach and exceed the goals we have set for the introduction of new services, new service locations, and improvement in the quality of our services and the number of individuals served (210 at the completion of DY5).

Specify the unique community need identification number the project addresses

- CN.5: Behavioral Health
- CN.7: Behavioral Health and Jail Population
- CN.12: Emergency Department Usage and Readmissions

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Lakes Regional is currently providing services through telemedicine at some of our larger clinics, but we have not implemented or expanded the program into Kaufman County. Providing these telemedicine/ telehealth services is a new initiative for us in this region and will be a start-up program. This plan will enable us to significantly enhance our existing services delivery system. Our telemedicine/ telehealth infrastructure system/ program will enable flexible delivery of care and improved delivery times for services. Doctors will be able to connect to individuals in the rural clinics and provide services without needing to be located there (they can be at another clinic or even at their home office). Mobility through I-cloud connectivity will enable Lakes Regional to have the flexibility to provide connectivity to areas where access to services has been difficult for individuals' in need. Lakes Regional will be able to setup multiple connections to include private physicians, hospitals, other MHMR Centers, and other providers or resources in the community wherever they may be located.

Related Category 3 Outcome Measures:

IT-6.1 Percent improvement over baseline of patient satisfaction scores measuring patient's overall health status/functional status.

Although this Telemedicine/Telehealth Introduction/Expansion Project will enable services from multiple provider specialties in Kaufman County, it will share significant focus with the Lakes Regional Crisis Respite – Behavioral Support Wraparound Program Project. Within the IDD population, research has shown that there is a much greater instance of health problems[119]. With the help of telemedicine/telehealth technology, program staff will monitor mental and physical health status and outcomes to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population[120]. The specific ACT model planned for the program will result in better control of psychiatric symptoms, better quality of life overall, and

[119] Journal of Intellectual Disability Research 48 (2): 93-102, 2004
[120] Journal of Applied Research in Intellectual Disabilities. 19: 214-218

greater consumer and family member satisfaction [121]. The projected outcomes relate to an improvement in access to care, the quality of care and health outcomes, as well as an overall improvement in health for the target population. The CG-CAHPS survey produces ". . . comparable data on the patient's perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers[122]. The sharing of consumer satisfaction data (overall health survey results) between agencies and providers in the region regarding consumer satisfaction, will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and follow-up to care. Identified within the Crisis Respite Project there is significant data analysis planned with encounter based assessments to show and measure improvement in customer satisfaction in health/ functional status.

Relationship to other Projects

This project is related to 121988304.1.1 - Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system, "Crisis Respite – Behavioral Support Wraparound Program." Telemedicine technology will be utilized as an integral focus of the provision of care proposed in this project.

Related Category 4 Population-focused improvements: N/A

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of a Project Learning Collaborative, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Our telemedicine/telehealth project will provide great flexibility for the type of services and where the connections between providers can be established. With the rural nature of Kaufman County, the internet cloud based implementation planned for the project will open up the area for video communication between doctors' offices, schools, hospitals, jails, behavioral health clinics, and just about anywhere that there is broadband access (providers working out of their homes). The possibilities for expansion of this program are numerous and the services provided will result in overall cost reductions for the region. The project intervention was

[121] Phillips et al, 2001. . .Teague et al, 1995
[122] RHP Planning Protocol, page 398

valued based on studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: "Valuing Access to Timely Services through Telemedicine." These studies were completed through a contract with Center for Health Care Services. These valuation studies used cost-utility analysis which measure program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency room visits that are avoided). The proposed program's value is based on a monetary value of QALY gained due to the intervention multiplied by number of participants. The reviewed research cited Hollinghurst et al. (2010), among others which yielded a QALY gain per 100 patients served for a similar project population. Utilizing this research yielded the total valuation of **$1,791,134**.

Complete write-up of project research is available at the performing provider site. Additional cost effectiveness savings can also be assumed through avoidance of higher cost crisis emergency based services and transportation costs as a result due to the increased access due to this project.

Project Option 1.7.1 - Expand Telemedicine and Telehealth for Stoke Treatment

Unique Project ID: 020943901.1.1
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas Texas serving a Primary and Secondary Service Area population of approximately 3.2 million.

Intervention(s): This project will expand telemedicine to provide neuro-inteventionalist/specialist access for specialty care for stroke patients. Hospital emergency room physicians will have access to consulation via telemedicine phone consults and have the technological capability for people to connect via bi-directional video cameras for consultations.

Need for the project: Currently many hospitals in the region do not have access to a neur-specialist on their medical staff to assess and treat patients presenting with stroke symptoms. Patients are not properly treated without neuro-specialty care access which results in severe disability and even death that creates additional costs and burdens to healthcare system and society. Mortality for uninsured patients who suffer a stroke is 49% higher than insured patients and average length of stay is also significantly higher.

Target population: The target populationare patients who present to emergency rooms with stroke symptoms. These patients need to be assessed and treated with in one hour for optimal care. Approximately 20% of the patients in the region with stroke are Medicaid or indigent.

Category 1 or 2 expected patient benefits:. It is estimated we will use telemedine to diagnose, triage and treat stroke patients of DY2-2,000, DY3-3,000,DY4-4,000, DY5-5,000. Patients will received neuro-specialist consults to triage, diagnose and decide treatment plan for patients who would otherwise not have access to a neuro-specialist.

Category 3 outcomes:

- IT-4.10 IV tPA Treatment Rat for Stroke Patients. Our goal is to increase treatment rate to 15% by DY 5.
- IT-4.10 Decrease ALOS Our goal is to reduce the length of stay by 5% in DY 4 and 5% in DY 5 for a total reduction of 10%.
- IT-4.10 Door to Needle time IV-t-PA administration. Our goal is to improve time by 10%DY 4 and 10%in DY5 for a total reduction of time by 20% from baseline

Project Description

Medical City Dallas has developed an effective and resource-efficient plan to reduce the morbidity, mortality and economic burden of stroke across the north Texas region. The foundation of this plan is the alignment of regional hospitals who voluntarily join together to form a system of stroke care.[1] Participants use standard, best evidence-based protocols in order to achieve consistent, high-quality care across the continuum. In turn, facilities gain immediate access to a vascular neurologist via telephone and/or remote presence for their patients who suffer acute stroke. Remote presence is the technological capability for people to connect via bi-directional video cameras placed at differing geographical end points (telestroke).

Telestroke technology is vital to the success and maturation of a stroke system of care.[1] It provides patients in both rural and urban hospitals with real-time, bedside access to neurovascular physicians for the rapid triage and management of stroke. These specialists help emergency room physicians in the decision making process to use intravenous (IV) thrombolysis with tissue plasominogen activator (tPA). They also assess patients' eligibility for catheter-based treatments for ischemic stroke (intra-arterial thrombolysis and clot-retrieval devices) and hemorrhagic stroke (brain aneurysm coiling and brain AVM embolizations). The ability to examine and communicate with patients, view imaging studies, and interview the families also assists physicians in deciding whether the patients need to be transferred to a higher level of care, or if unnecessary transfers can be avoided.

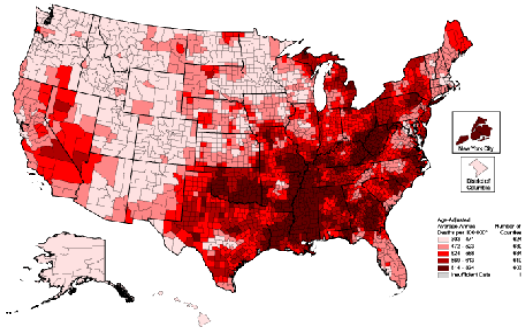
Medical City Dallas launched this initiative in March, 2010 and the network has continued to grow. While over 60 hospitals have contacted physicians by telephone, only eleven facilities in the network currently have remote presence capability. Many more hospitals in our region are seeking telestroke support to help save patient's lives and decrease disability due to stroke.

Goals and Relationship to Regional Goals

The 5 year goals of this initiative are to 1) to improve outcomes for patients who suffer stroke by providing access to specialists who deliver both the standard of care and cutting-edge therapies, and 2) decrease healthcare costs associated with acute stroke by triaging patients to the appropriate facility and avoiding unnecessary transfers.

Telestroke networks have been developed around the globe in both rural and urban settings. Telemedicine has facilitated a 4-fold increase in the rate of administration of tPA within a 3-4.5 hour window.. Telemedicine has also demonstrated use in remote treatment and subsequent transfer of patients with acute stroke using the "drip and ship" paradigm.[3]

Despite advances, no such network has been developed in north Texas, until now. Stroke care is an ideal application of remote presence technology because of its large societal impact on both cost and quality of life for patients. Current treatment rates are difficult to assess, but are known to be low.[4] With improved access, treatment rates can rise higher than 21%.[5] Medical City Dallas will target north Texas hospitals whose treatment rates remain below 10%.



North Texas is part of the "Stroke Belt"

In Age-Adjusted Death Rates per 100,000 Population for Stroke by State: Texas Ranks #41
http://circ.ahajournals.org

This project supports the regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care.

Challenges

Stroke is an unscheduled event that can happen to anyone at any location. Treatment of stroke is time-sensitive and thus requires physician specialists who are in short supply to diagnose and may also require subspecialists and technologies that are geographically few and far between but necessary for life-saving treatments.[2]

Medical City Dallas has secured vascular neurology expertise to handle large call volumes. Physicians are on call 24/7/365 for any area emergency medicine physician or other physicians through a primary one-call transfer center line at no charge. Additional vascular neurologists (3) were recruited in 2012 to accommodate increasing calls (average call volume = 15/day) and to be able to expand and grow the network.

The added implementation of telestroke is an ideal application that can lead the way to a new and improved paradigm of healthcare delivery. Recognizing the need in north Texas to expand the quality of stroke services, Medical City Dallas has partnered with In Touch Telehealth® to provide technology equipment and with QuestCare Telehealth, Inc for additional physician manpower for those facilities that lack full time neurology coverage in their emergency departments.

5-Year Expected Outcome for Provider and Patients

Years 2-5 (2013-2016): During this four year period, Medical City Dallas will deploy and support 40 additional remote presence cameras in north Texas to access neuro-specilaty care. Quality Metrics will be continuously monitored and achieved, bi-directional data will be shared between sending and receiving hospitals, patient case studies and education will be provided by physicians and staff. Patient discharge destination data will be collected, reviewed and publicly reported. At the end of 5 years with 40 additonal sites, we will have increased treatment rates (IV t-PA) for stoke patients by15% for the targeted population and created a telestroke program for these sites to support efficient stroke care for treatment within 60 minute goal.

Starting Point/Baseline

Starting point of this project expansion in Year 1 (2012) deployed eleven operational cameras within the system (internal). Two additional external cameras will become operational by the end of 2012 – Wise Regional (Decatur) and Hendrick (Abilene).Quality metrics have been established and will be monitored for any adjustments needed through 2012.

Rationale

Currently there are several treatment options for patient with active stroke symptoms however time is critical in diagnosing anf treating for optimal outcomes.

An ischemic stroke patients' window of opportunity for treatment is 12 hours for an optimal health outcome. The best outcome is for patients to be treated with tPA with in first 3 - 4.5 hours of first symptoms to dissolve the blood clot and restore blood flow to the brain. For patients who are not diagnosed within the 4.5 hours of first symptoms, an assessment to see if a patient will qualify for comprehensive treatment will be performed up to 12 hours after first symptoms. Patients who qualify can receive catheter-based treatments such as intra-arterial thrombolysis and clot-retrieval devices. Patient with hemorrhagic stroke may receive brain aneurysm coiling and brain AVM embolizations. However none of these treatments will be possible without access to a neuro-specilist.

The use of IV tPA in community hospitals has been limited by the lack of neurologic support. The main barrier to increasing treatment among those patients arriving within 3-4.5 hours is physician reluctance to deliver therapy in absence of available acute stroke expertise around the clock.

Systems of care that provide neurologic support via telemedicine have been able to increase treatment rates by as much as 72%.[2]
In addition to raising treatment rates for acute ischemic stroke, it is important to avoid unnecessary transfers. Often patients are transferred from rural areas when no additional treatment options are available upon their arrival.
This is a both a burden to the patients and their families, as well as an economic burden to the healthcare system. With access to telestroke specialists, facilities can access better triage and diagnosis to better determine treatment options for patients. Medical City Dallas will collect, analyze and report the impact of instituting telestroke to ensure that target metrics are met. Results will be posted and will be made available to EMS agencies and hospitals across the region.

Project Option:
Currently, there are 60 metroplex hospitals and 52 rural hospitals that access curbside consult care through the Medical City Dallas's North Texas transfer center. Calls regarding stroke triage and care emanate from any one of these facilities for emergent care. Since March 2010, over 64

facilities have called the Medical City Dallas contracted physicians for assistance. The goal of this project is to have an additional 40 sites with telemedicine cameras at the end of the waiver that can perform assessment and treatment via consults.

Medical City Dallas launched this initiative in March, 2010 and the network has continued to grow. While over 60 hospitals have contacted physicians by telephone, only eleven facilities in the network currently have remote presence capability. Many more hospitals in our region are seeking telestroke support to help save patient's lives and decrease disability due to stroke.
There are three vascular neurologists that are on primary stroke call and four interventional neurologists that take comprehensive call (those patients that need endovascular treatment). All seven neurologists are trained in both vascular and neuro-critical care medicine. Average number of calls per day = 15.

The telestroke network will establish milestone and metrics to measure number of consults and establish appropriate protocols and training for staff and physicians will be put in place for how and when to use telemedicine consults. Training will be necessary on telemedicine equipment as well.

It is important that physicians have timely access to neurology consults, we will put in place a measure to ensure once consult is initiated that it is delivered in appropriate time frame (15-20 minutes).

Additional care coordination and conferences will be necessary as part of education, training and outreach.

Project Components

The core components of Project 1.7.1 will be implemented:

a) Provide patient consultations by medical and surgical specialists as well as other types of health professional using telecommunications

b) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Unique Community Need Identification Numbers the Project Addresses

The community needs assessment identification number CN.9 Specialty Care supports this project.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

Developing alternative networks for the delivery of health care has been a stated goal in the debate on healthcare reform. There is the acknowledged need to innovate toward new healthcare models that reduce cost and yet improve quality and accessibility.[3]

Related Category 3 Outcome Measure(s):

IT-4.10 Safely increase the treatment rates of ischemic stroke with IV t-PA from the current estimated 3% - 4% to greater than 10% for the entire system within 4 years. Specific metrics measured: rate of IV tPA treatment (%) for all acute ischemic stroke patients presenting to facility that are eligible (exclusion criteria applied):

- Numerator= # of patients who received IV tPA treatment

- Denominator= Total # of ischemic stroke patients eligible for treatment

The NINDS trial showed that patients who received IV t-PA therapy have better outcomes.[7] Discharge destinations will be monitored and Modified Rankin scores at 90 days performed to determine level of disability post stroke.

IT-4.10 Other: Door-to-needle time for the administration of IV tPA < 60 Minutes. IV tPA is the only FDA approved treatment for ischemic stroke patients in the first 4.5 hours from first onset of symptoms to restore blood flow in the brain. Because of the importance of rapid treatment, national guidelines recommend that hospitals complete the clinical and imaging evaluation of acute ischemic stroke patients and initiate intravenous tPA therapy within 60 minutes of patient arrival in those without contraindications. Providing IV tPA with short door-to-needle time reflects acomplex clinical process requiring coordination across departments and disciplines to effect timely triage, diagnosis, decision making, and treatment of a critically ill acute ischemic stroke patient. The telestroke program goal is to provide specialty care access to faciliate triage , diagnosis and decision making. The speed with which the patient receives IV t-PA is inversely proportional to the patients outcome, thus decreasing door-to-needle times for the administration of IV tPA to less than 60 minutes in at least 50% of all patients who receive IV tPA via telestroke within 2 years will be a project goal.[8] Specific metrics measured: time of call to neurology expertise and time of consult to delivery of medication.

IT -4.10 Other: Decrease length of stay (LOS) by increasing treatment rates and decreasing unnecessary transfers. All telemedicine stroke consults will be tracked to ensure that LOS is positively impacted. Goal: to decrease LOS by 10% of the overall ischemic stroke patients.

The Telestoke program will also measure the Symptomatic intracerebral hemorrhage (sICH) rate. It will be assessed post IV t-PA using the following criteria: Any evidence of hemorrhage on imaging combined with NIHSS worsening > 4 points.[6] This will ensure that IV t-PA is given safely – all complications from sICH will be reviewed with hospital to verify that protocol adherence was not violated

Increase access to both the standard of care and cutting –edge therapies in acute stroke, while decreasing unnecessary transfers and costs to patients and the cerebrovascular healthcare delivery system. Specific metrics to measure: time of decision to transfer to arrival.

Relationship to other projects

This project supports reducing Category 4 population focused improvements 020943901.4.5 RD-4 Patient-centered Healthcare in improving the patient experience with timely and appropriate access to specialty care.

Relationship to other Performing Providers in the RHP and Plan for earning Collaboratives

Other proposed projects to address integrated primary and behavioral health services include:

- HCA Medical City 020943901.1.2
- Lakes Regional 121988304.1.2
- UTSouthwestern 126686802.1.4

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology Medical City Dallas defined the population that will be directly impacted by the project as patients receiving a neuro-specialist consult. To provide these consults, neuro-specialists will need to be secured and available 24/7 for 40 additional sites. The estimate value is $1,092,000 for 4 years of the project based on minimum 30 minute time per consult valued at $78 each -annual income of specialist 650k year and volumes ,DY2-2000,DY3-3000, DY4-4000, DY5-5000. It will be necessary to continue to train physicians and

staff on stroke protocols, treatment and use of technology. This is estimated at $183,00 per year for 4 years for a total value of $732,000.
It is also projected a 15% Treatment Rate for IV tPA in targeted population will result in less disability or severe disability in patients. We estimate 25% of the patients will be eligible for IV tPA (3500 patients, DY2-500, DY3 -750, DY4-1000, DY5-1250) and treatment rate at 15% by DY 5, total 365 patient would receive treatment who would not have otherwise(DY2-25, DY3-52, DY4-100, DY5-188). Of these 120 patients, 33% would have not long term disability bases on trial studies (DY2-8, DY3-17,DY4-33,DY5-62). It is estimated based on a British study, annual direct cost of disabled stroke patients and lost productivity was $30,600, for a total of $3,672,000.
In addition, length of stay will be reduced for stroke patients. We estimate this to be approximately 945 days with internal cost estimates per day of $1,000. This is a total value of $945,000.
The remainder of $23,085 for total value was reduced to balance total funding.

The total value of the project then was estimated at $6,417,915. Approximately 80.62% of the total value was assigned to Category 2 project ($5,174,491) and the remaining value was assigned to Category 3 outcomes 6.46% IV TPA Treatment Rate ($414,470), 6.46% for Average Length of Stay ($414,471) and 6.46% for Door To Needle Time ($414,483.

Rationale/Justification: Outcome improvement targets are dependent on the target population served, size (e.g. if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that to treat stroke patients.

Project Option 1.7.1 - Implement telemedicine program to provide or expand specialist referral services in an area identified as needed in the region. (Implement a Telepsychiatry program to improve Specialty Care Access for Behavioral Health)

Unique Project ID: 020943901.1.2
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas, Texas serving a Primary and Secondary Service area population of approximately 3.2million.

Intervention(s): This project will expand telemedicine to provide consultations by a psychiatrist to emergency room or internal medicine physicians for patients with psychiatric diagnosis to facilitate appropriate and timely treatment for behavioral health /substance abuse diagnoses.

Need for the project: Currently psychiatrists are not available to treat patients in Emergency rooms and are limited for inpatient treatment of patients with psychiatric conditions present at an acute care hospital. ED and internal medicine physicians are limited in their ability and comfort in treating psychiatric disorders. It takes 24 hours to 3 days for hospitals in the region to get patients appropriate treatment including but not limited to placement.

Target population: The target population is patients that need psychiatric assessment and treatment who present to acute care emergency rooms. Approximately 70% of patients at the hospitals served by this project that present to an ED a with a behavioral health primary diagnosis are Medicaid eligible or indigent. We expect at least 60 % of the consults for behavioral health will be delivered via telemedicine by DY 5.

Category 1 or 2 expected patient benefits: The project seeks to provide psychiatric medicine consults to patients in ED. It is expected there will be consults of DY3-2,991, DY4-3,595 and DY 5-3,703. It is expected that a percentage of these consults will be consult via telemedicine cameras verus phone or in person consults from a mid-level practioner. We expected these ot be DY3- 1500, DY 4-2,300 andDY5-2,400.

Category 3 outcomes: IT-2.4 Our goal is to reduce the Behavioral Health/Substance Abuse Admissions by 152 admission. We estimate the rate as defined by protocol to be .505% in the region. This would reduce the rate by1%by DY5.

Project Description

This project will implement a telemedicine program with psychiatric specialists to be able to consult, evaluate and treat patients at remote sites. For this program Medical City Dallas will contract with Green Oaks Hospital in Dallas will provide access to psychiatric providers to hospitals in the region and across the state to obtain the services necessary from these specialists. These specialists may be located in the region but due to travel and distance limitations they cannot see patients in multiple locations in an efficient manner. The

telemedicine program would allow access to those specialists for consultations and treatments. Medical staff credentialing and program policies and procedures will be developed as well as equipment procurement in order to implement the program.
A team of behavioral health specialists will be available to be onsite as well to do an assessment to determine if a telemedicine psychiatric consult is appropriate. If appropriate, a consult with a psychiatrist will take place. The outcome of the psychiatric consults will vary but they can determine appropriate medications, treatment courses, clearance for discharge and appropriate level of care for discharge.

DY 2 would serve as a baseline period to measure the number of patients in the target population. Although we have information on patients from the hospital with behavioral health diagnosis, these would not be the total target population as coding variations and a range of behavioral diagnosis do not accurate report patients that this program would serve. We are currently estimating volumes based on coded claims and estimates of patient that will need psychiatric care versus mid-level practitioner care will need further baselining in DY2.

Goals and Relationship to Regional Goals

The goal of the project is to have psychiatric consults available for evaluation and treatment of patients so we can decrease the time to obtain a consult, obtain appropriate and timely treatment as necessary and discharge and place patients in the appropriate level of care. Acute care hospitals have limited or no available medical staff with this specialty. Also, there is an acute shortage in the metro area for psychiatric providers thus the entire region is underserved. By implementing the telemedicine option, hospitals will be able to access consults by psychiatrist for patients in emergency rooms and hospitals. Currently due to the lack of specialty care access, emergency room physicians and internal medicine physicians due their best to stabilize patient while waiting for psychiatric beds or treatment. Telemedicine supports efforts to enhance, expand and improve the efficiency and timeliness of specialty care services in the community

This project supports the regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care.

Challenges

Like many communities in the country, the Dallas-Fort Worth is experiencing a growing patient demand for behavioral health care services. In addition, the prevalence of co-occurring behavioral health conditions with medical encounters has increased the complexity of care and need for coordination with mental health professions in the acute care setting. The current mental health workforce shortage limits the availability of psychiatrist to be on medical staffs at acute care hospital providers. Because there are no available medical staff with this specialty, access to care can be delayed. It can take anywhere from 24 hours to 3 days for hospitals in the region to get patients appropriate treatment including but not limited to placement in psychiatric hospital. In some instances, in order to obtain necessary evaluation for acute

patients, they may be transferred to multiple hospitals for a single episode of care, resulting in increased cost and service duplication, with more opportunities for errors and coordination problems. In implementing a telemedicine program it will be important that the technology is user friendly, regular training session take place, and physicians are comfortable with knowing when to use the service.

The purpose of performing this project is to facilitate the access to psychiatric specialists for consults and treatment.

5-Year Expected Outcome for Provider and Patients:

This project will address the need for timely specialist consults for patients by access specialist via telemedicine options. Apercentage of these consults will be via telemedicine cameras verus phone or in person consults from a mid-level practioner It is expected at the end of waiver we will have at least 60% of behavioral health consults will be delivered via telemedicine.

Starting Point/Baseline:

DY 2 would serve as a baseline period to measure the number of patients in the target population. Although we have information on patients from the hospitals with behavioral health diagnosis, these would not be the total target population as coding variations and a range of behavioral diagnosis do not accurate report patients that this program would serve.

Rationale

The use of technology to deliver health care from a distance, or telemedicine, has been demonstrated as an effective way of overcoming certain barriers to care. In addition, telemedicine can ease the gaps in providing crucial care for those who are underserved, principally because of a shortage of sub-specialty providers. The hospital experiences a growing number of patients presenting with mental and behavioral health illness that cannot be appropriately assessed and treated by Emergency room physicians and hospitalists.
As noted in the 2009 California HealthCare Foundation report, Telepsychiatry in the Emergency Department: Overview and Case Studies "mental health-related patients in the ED disproportionately affects the operation of the ED for other patients in terms in space, staffing and resources. Safety issues arise for these patients, other patients and staff. To further complicate matters, many EDs are not properly equipped to handle most mental health emergency patients, which has led to improper diagnoses, prolonged ED stays, and misuse of physical restraints.[18,19]"
Giving these physicians and staff access to appropriate specialist in the hospital setting will allow for timely, appropriate assessment, treatment and proper discharge planning. An additional benefit is the increased psychiatric knowledge of the ED physicians and staff after implementing the program from their continued contact with psychiatrists. With improved access to specialists, we expected increased quality and patient satisfaction with care, improved clinical outcomes, improved emergency room throughput and cost savings.

Project Components

The core components of Project 1.7.1 will be implemented:

a) Provide patient consultations by medical and surgical specialists as well as other types of health professional using telecommunications

b) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

It will be necessary to have a baseline number of patients who are in need of a psychiatric consult. Today we only have limited information on consults ordered by medical records. Medical City Dallas currently contracts with Green Oaks Hospital to provide assessments at the hospital sites via behavioral health specialists or transports patients to the hospital to be assessed. In 2011 they assessed over 150 patients at Medical City Dallas and 7,000 in the region. However, the behavioral health specialists used at remote sites are not psychiatrists and limited in their ability of services to provide. A needs assessment will be conducted identify volume /baseline of patients that need a psychiatric consult that can be delivered via telemedicine. Specific protocols will be put in place for how and when to use telemedicine consults. Once the need is quantified, telemedicine program can begin a project plan to implement the program. The implementation will involve policy and procedure development, medical staff credentialing, procurement of equipment, and training of staff and physicians. Continuous quality improvement activities will be utilized ensure successful implementation. Metrics to measure volume of consults and timeliness of patient disposition on consult is obtained will assist in measuring the effectiveness of the program.

Unique Community Need Identification Numbers the Project Addresses

This project addresses the shortage of Specialty Care in the region as well as access to Behavioral Health services. These are identified in the community needs assessment as CN.9 Specialty Care and CN.5 Behavioral Health.

How the Project represents a new initiative

The project is a new initiative for Medical City Dallas and Green Oaks Hospital as they are currently piloting the telemedicine program for behavioral health care 2012. Green Oaks Hospital is an inpatient psychiatric acute provider in Dallas, Texas and part of the NorthSTAR provider network. The NorthSTAR Behavioral Health program has been jointly administered by

the Texas Department of Mental Health and Mental Retardation (TDMHMR) and the Texas Commission on Alcohol and Drug Abuse (TCADA) as a 1915(b) Medicaid Waiver program in a seven-county area around Dallas. The program serves the medically indigent and most Medicaid recipients who reside within this region. Green Oaks Hospital also performs the screening of patients before admission to inpatient treatment for ValueOptions. ValueOptions NorthSTAR is the BHO (Behavioral Health Organization) who is responsible for the maintenance of the provider network and care management for the enrollees. This telemedicine program would be a new initiative to serve NorthSTAR and non- NorthSTAR patients and hospitals in the region.

Related Category 3 Outcome Measure(s)

IT-2.4 Behavioral Health/Substance Abuse (BH/SA) Admission Rate (Standalone measure)

Due to lack of access to specialists, patients are often admitted until consult can be obtained. By giving physician and staff access to specialist, they can determine appropriate treatment and level of care necessary to reduce admission rate. Patients admitted require more intense service such one on one care leaving other resource stretched and other care exposed position to care for other patients.

Relationship to other projects

This project supports reducing Category 4 population focused improvements 020943901.4.2 RD-1 Preventable admissions and 020943901.4.3 RD-2 30- day readmissions by allowing specialist to assess and patients timely and in the appropriate setting. This project also supports 020943901.4.5 RD-4 Patient-centered Healthcare in improving the patient experience with timely and appropriate access to specialty care.

Relationship to other Performing Providers in the RHP and Plan for earning Collaboratives

Other proposed projects to address integrated primary and behavioral health services include:

- HCA Medical City 020943901.1.2
- Lakes Regional 121988304.1.2
- UTSouthwestern 126686802.1.4

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared

learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology

Medical City Dallas defined the population that will be directly impacted by the project as patients receiving a psychiatric consult. To provide these consults, psychiatric specialists will need to be secured and available 24/7. The estimate value is $1,825,000 for 5 years of the project based on daily value of $1,000. Additional 5 year values for resources needed for the project include 1) administrator $500,000 2) staff $300,000, 3) IT equipment , IT resources and IT lines $1,000,000, and 4) training $83,000. In addition, it is projected 91 Behavioral Health/Substance abuse admission will be avoided. These are valued at $170,898 based on internal cost per admission of $1,878.

An additional 15% value was added for overhead for administering the program (CEO time, Medical staff etc.), $584,470.

The remainder of $6810 for total value was added to balance total funding.

Another approach for project value was reviewed based on estimated DY3, DY 4 and DY 5 additional capacity from timely discharge resulting from telemedicine consults (DY3-1500, DY 4-2300, DY5-2400). We estimated additional visits of 12,400 were would be possible from decreased holding and turn around time for ED visits. We used the average contribution margin for Medicaid visit from internal data of $360/ per visit for a total of $4,464,000. We believe this supports the overall valuation of $4,471,278.

The total value of the project then was estimated at $4,471,278. Approximately 80.65% of the total value was assigned to Category 2 project ($3,606,157) and the remaining 19.34% of value assigned to Category 3 outcome for Behavior Health/Substance abuse Admission Rate ($865,121).

Rationale/Justification: Behavioral health outcome improvement targets are dependent on the target population served (behavioral health), size (e.g. if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (boarded in ED/placing patients under observation instead of admitting them due to lack of behavioral health services).

Project Option 1.1.1- Establish more primary care clinics
(Expand Primary Care for Pediatrics by establishing a new clinic)

Unique Project ID: 020943901.1.3
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas, Texas serving a Primary and Secondary Service Area population of approximately 3.2 million. Medical City Dallas operations include pediatric services with a dedicated 11 bed Pediatric Emergency Room, 60 bed Pediatric Med/Surg unit, 20 bed Pediatric Intensive Care Unit and 55 bed Neonatal Care Intensive Care unit.

Intervention(s): This project will establish a pediatric clinic in the north Dallas area to provide access to pediatric care for preventative and primary care.

Need for the project: Currently pediatric providers in the region have limited the number patients or do not accept Medicaid/CHIP patients. The current pediatric physician demand is more than 80% of the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment.

Target population: The target population is Medicaid/CHIP and uninsured pediatric patients that need a primary care provider and medical home. Approximately 90% of patients referred to the clinic will either Medicaid eligible or indigent.

Category 1 or 2 expected patient benefits: The project seeks to provide 4,000 patient visits in DY4 and 6,000 in DY5 by providing a medical home to patients in DY1-0, DY2-500, DY 3-1,000, DY4-2,000 and DY5 3,000

Category 3 outcomes: IT-9.3 Our goal is to reduce the Pediatric/Young Adult Asthma Emergency Department Visits by 15% by DY5. In DY3-5% ,DY4-15%, DY5- 15% for a total 35% reduction from total baseline visits of 1100. We expected to reduce the rate of Medicaid and indigent patients (715 visit a year) by 55%,393 visit per year (which 35% of total visits,1100).

Project Description

Medical City Dallas will partner with PediPlace, a nonprofit organization to establish a new pediatric primary care outpatient clinic in the North Dallas area. This clinic will open with 2 medical providers and staff to see Medicaid/CHIP and uninsured pediatric patients. Medical City will develop a referral process for patients from ED for primary care and from the main hospital for newborn care. This will support patients for appropriate follow up care and have access to a provider for well child preventative visits.

The clinic will be located at a site in the North Dallas area based on:

1. zip codes of patient seen in ED and newborns for Medicaid and Uninsured
2. Pediatric providers availability in the area
3. Transportation access and other service availability (WIC, Public health etc)

Once a site is located and secured, detail planning for operations will begin. It is projected to take 6-9 months to open the clinic once a site is secured. Planning and development will include space build-out, EMR, staff hiring and training and in addition to recruiting 2 Nurse Practitioners. The clinic will have the capacity for 3-4 providers in total, so in the future additional providers and/or hours can be added.

As part of the referral process, Medical City Dallas will track and follow up with patients to see if they have utilized primary care services at Pedi Place. The clinic will also operate various programs to serve as a medical home for patients and families. These include the Illness to Wellness Program for children with acute and chronic diseases, Healthy Babies and Healthy Kids programs for preventive care, and appropriate parent education about providing proper care to new born children and proper instruction on how to and when to access services, particularly during a child's first two years.

Goals and Relationship to Regional Goals:

The goal of this project is to increase pediatric clinic sites and providers for Medicaid/CHIP and Uninsured patients in the North Dallas area. This will establish a medical home for patients with acute and chronic conditions so they diagnosed and treated early, resulting in less hospitalizations and specialty care. Providing families with a medical home will allow them to bring their children to a friendly, familiar place for routine preventative care, immunizations, and a comforting helpful facility when they are sick.

We believe we can reduce Emergency room visits for all pediatrics including those with asthma, and increase well child care for newborns.

Regional goals include having better health outcomes and reduced health cost. This project creates a pediatric medical home, to provide primary care and preventive well baby care. Improved primary care and preventative care will result in better health outcomes and reduced cost from less Emergency room visits resulting in the right care in the right setting.

Challenges

One of the challenges faced for pediatric patients is ensuring primary care availability. Currently pediatric providers have limited their panel of Medicaid/CHIP patients and fees for uninsured patients are a huge barrier leaving a gap in service to low income populations.

5-Year Expected Outcome for Provider and Patients

By the end of the waiver period, we expect to have 3,000 unique patients who will have a medical home at the clinic.

Starting Point/Baseline

The clinic would not open until mid-2013, so baseline would be established in DY 2.

Rationale

The community needs assessment identification CN. 4 Primary Care and Pediatrics support this project. The current pediatric physician demand is more than 80% of the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment. The capacity for pediatric primary care is further limited by the decline in pediatricians accepting Medicaid patients. Adding a new pediatric provider at a site that is closer to patients in the North Dallas area would be increase capacity to serve the Medicaid/CHIP and Uninsured patients

Project Option

Medical City sees over 3,600 level 4 and 5 visits for Medicaid/CHIP and Uninsured patients each year. However we believe the percent of visits to the Emergency Room that are Non-Emergent, Emergent but Primary care Treatable or Emergent but Preventable is much higher. Adding a primary care clinic for this patient population will reduce need for seeking treatment in emergency room.

This clinic will also provide comprehensive newborn care. Well child preventive visits for children ages three days – fifteen months are very important to both child and parent. The American Pediatric Society recommends that children receive eight well-child exams in their first fifteen months to monitor early development, receive timely recommended immunizations, educate parents and caregivers, and to allow for early diagnosis of medical issues if they occur.

Project Components

The clinic will be new clinic located in North Dallas area. It will be staffed by 2 medical providers dedicated to this clinic location as well as support staff. Strategic planning has occurred to identify primary care gaps and possible locations for the clinic that would best serve patients in need. Once a location is found, planning and implementation will start to open the clinic in 6-9 months. Hiring and training of staff will be necessary as well as. Patients will be referred from Medical City Dallas but the clinic will see any patients referred to their services regardless of financial status.

Unique Community Need Identification Numbers the Project Addresses

The community need identification number this project addresses is CN.4 Primary Care and Pediatrics. As documented in the Community Needs Assessment for RHP 9, the current pediatric demand is more than 80% of the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment. Medical City Dallas pediatric emergency room provides are for 3,600 urgent care level visits each year with limited referral capacity for patients who need care in a more appropriate and cost effective setting.

How the Project represents a new initiative

Medical City does not currently have a clinic site for pediatric care in this service area. This clinic will enhance delivery system by increasing pediatric provider for low income populations and improving their health outcomes with preventative care.

Related Category 3 Outcome Measure(s)

This project will impact outcome IT-9.3 Pediatric/Young Adult Asthma Emergency Department Visits- NQF 1381. It is important for the region to improve ED utilization as patients have had to utilize most the costly setting for care due to lack of access to primary and preventative care. By providing a primary care provider and medical home to pediatric asthma patients along with patient and caregiver education in asthma management will help reduce asthma morbidity in children and decrease the substantial costs of pediatric asthma. The majority of patients being served by this project qualifies for Medicaid/CHIP or is uninsured. Improving asthma outcomes for these patients will improve health of low-income populations.

Relationship to other projects

This project supports the reduction of 020943901.4.2 RD-1 Potentially Preventable Admissions (Pediatric Asthma) and 029043901.4.3 RD-2 30 Day readmissions (Pediatric Asthma) by providing a medical home to patients with acute disease.

Relationship to other Performing Providers in the RHP and Plan for Learning Collaboratives:

The following providers are also proposing projects to address pediatric primary care clinics:

- Children's Dallas 138910807.1.1

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may

enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:
Medical City Dallas defined the population that will be directly impacted by the project as patients receive a medical home at the pediatric clinic and those patients with pediatric asthma. There were 2 measures used for this project valuation, patient provided a medical home and pediatric/young adult emergency room visits. The population expected to be positively impacted by the project for primary care and medical home is 3,000 patients by DY 5, (DY3-1000, DY 4-2000, DY5- 3000). The estimated pricing for medical home was $650 per year per patient. This value was obtained from averages of various PCMH studies (Intermountain Healthcare, Blue Cross Blue Shield, etc.) The value is based on investing in primary care patient centered medical homes resulting in improved quality of care and patient experiences and costs compared to non-PCMH patients and reductions in expensive hospital and emergency department utilization. This totaled approximately $3,900,000 for 5 years.
The population expected to be positively impacted by the project for reduction in pediatric/young adult asthma patients is 385 visits by DY 5. The estimated cost for a pediatric/young adult ED visits from internal data is $1210. This totaled approximately $465,850

The remainder of $1,896 for total value was added to balance total funding.
The total value of the project then was estimated at $4,367,746. Approximately 80.63% of the total value was assigned to Category 2 project ($3,521,529)and the remaining 19.37% of value assigned to Category 3 outcome for Pediatric/Young Adult ED Visits ($846,217).

Rationale/Justification: Outcome improvement targets are dependent on the target population served and also current processes in place that already prevent avoidable ED visits and hospitalizations.

Project Option 1.1.2 – Expand Primary Care Capacity – Grand Prairie Clinic

Unique Project ID: 127295703.1.1

Performing Provider Name/TPI: Parkland Health & Hospital System/TPI 127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. While Parkland's overall payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance, the Community Oriented Primary Care (COPC) clinic network's payer mix includes 62% Charity/Self Pay and 20% Medicaid.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Total Adult	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Parkland directly employs approximately 150 primary care physicians (pediatrics, family medicine, internal medicine) who provide services in the community health centers. Campus based physician services are provided mainly by UT Southwestern Medical Center faculty under a services contract.

Intervention: Expand primary care capacity for low income/indigent patients by rapidly scaling up operations at the newly opened Community Oriented Primary Care clinic (COPC) in Grand Prairie in Dallas County.

Need for the Project: There is a significant population (65,000 individuals) in Grand Prairie, Texas living at or below 200% of poverty level. There are limited primary care resources available to serve this population. By making primary care services available in a recognized medical home model, this vulnerable population will have access to services that can prevent illness, assist in the management of chronic disease, support episodic illnesses and contribute to the wellbeing of the community and the patients it serves.

Target Population: This clinic will serve residents of Grand Prairie (approximately 65,000 area residents) with income levels at or below 200% poverty.

Category 1 & 2 Expected Patient Benefits: Improved access to primary care services for patients in the Grand Prairie area (of Dallas County) as follows:

Volume	DY1	DY2	DY3	DY4	DY5
Baseline (FY 10.31.11)	1,889 (7,556 annualized)				
Additional visits		7,500	12,000	12,000	4,000
Cumulative additional visits		7,500	19,500	31,500	35,500
Cumulative annual visits	1,889	9,389	21,389	33,389	37,389

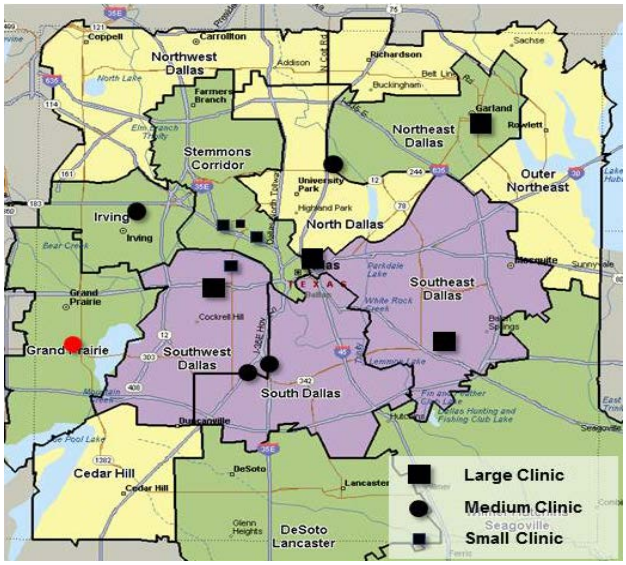
Category 3 Outcomes: The FY2016 outcomes for this project include the following:

- IT-1.2: Annual monitoring for patients on medications: ACE inhibitors or ARBS
    - Goal is to increase number of monitored patients
        - CHF: 83.7% (605 patients in FY12) to 88%;
        - Diabetes: 82.5% (2,282 patients in FY12) to 88%
- IT-1.12: Diabetes care: Retinal Eye Exam. Goal is to increase number of COPC patients who receive from 0 to 3,000
- IT-1.20: Other - % patient who by age 13 years up-to-date with recommended immunizations: 1) MCV4 and 2) one Tdap/Td. Goal to increase to 80% compliance. (1,617/2,456 = 66% compliance in FY2012)

Project Description

Parkland currently provides services in twelve Community Oriented Primary Care (COPC) health centers and eleven Youth and Family centers. Based on a study of demographics, existing provider availability and community need, Parkland planned and developed a new clinic in Grand Prairie, Texas to provide scheduled primary and preventive care services as well as same-day services via the Today Clinic model. The clinic was opened at a base staffing level in

June 2012 and at its maximum capacity could expand the existing Parkland community clinic system by more than 35,500 annual visits or nearly 8%.



As depicted in the Dallas County markets map, the Grand Prairie market segment is located on the western border of Dallas County consisting of three zip codes: 75050, 75051 and 75052. The roadway system and Mountain Creek Lake serve as natural barriers to services located to the east of the market segment. Accordingly, the residents of Grand Prairie are relatively geographically isolated from the existing Parkland system community resources noted by the black markers on the map. The new Grand Prairie clinic (denoted by the red circle) is centrally located in the market segment and provides good access to all residents.

In 2010, of the approximate 170,000 residents of the Grand Prairie market segment, about 40 percent or nearly 65,000 have incomes placing them below 200% of poverty. It is this population that this project is intended to serve. This project proposes to extend Parkland's primary care system model to serve this target market by enabling the Grand Prairie clinic to rapidly scale up its operations to its full capacity. The clinic will provide adult, pediatric and women's (initially maternal and family planning) primary care services and has the capacity to provide approximately 35,000-40,000 visits. Based on historic system experience, this would translate into service to approximately 14,000 – 16,000 new individual patients.

Goals and Relationship to Regional Goals

This project aligns directly to address the primary care capacity need identified in the Community Needs Assessment and specifically places the new primary care capacity in a location where existing primary care resources are in short supply and where natural barriers present access challenges to existing Parkland system resources. Further, this project aligns directly with the RHP 9 goal of improving access to health care services.

Challenges

As presented in the Community Needs Assessment, the State and region in which RHP 9 resides has significant shortages of primary care physicians. The rapid service scale-up envisioned by the project will challenge the system's physician and clinical staff recruitment efforts. However, Parkland has a well-established recruitment process and pipeline that should alleviate the recruitment challenges.

5-Year Expected Outcome for Providers and Patients

This project will provide a significant and valuable new primary care resource to the Grand Prairie market segment. By DY5, the clinic will be serving between 14,000 and 16,000 individuals and providing 35,500 new primary care visits. This project will provide a continuous source of primary care in a practice recognized as a primary care medical home. Patients will receive preventive, chronic disease management and same-day responsive services.

Starting Point/Baseline

Parkland opened Grand Prairie in June 2012 and in three months provided 1,889 visits. The baseline for this project is set at 1,889 visits (annualized 7,556) for FY2012 (October 1, 2011-September 30, 2012).

Rationale

In Dallas County as elsewhere, low income, uninsured, and minority populations disproportionately lack access to care. Dallas County has more than one million residents living at or below 200% poverty many of whom have very limited access to health services.[123] Parkland is the largest provider of care for the medically indigent in the region; however, the system is at capacity constraining care throughout the continuum including primary care clinics, the ED and the specialty clinics. Access to primary care services is demonstrated to offer a lower cost model for prevention, health maintenance, chronic disease management and episodic condition management. It supports the reduction of emergency service use for non-emergent conditions and contributes to reductions in readmission rates.

How this project significantly enhances an existing care delivery reform initiative

By introducing 35,500 new primary care visits, this project directly supports the need for expanded primary care services for the low income patient population in Grand Prairie. This new access will also provide access to a system of care including a primary care medical home through which same day appointments, episodic and chronic disease management services will provide a comprehensive system of primary care.

The project has no related activities funded by U.S. Department of Health & Human Services.

Project components

Required core components for Project Option 1.1.2 are as follows:

[123] US Census Bureau.*2009 American Community Survey.* http://www.census.gov/acs/www/data_documentation/summary_file/

a) Expand primary care clinic space. *This was a new clinic built in 2012 and sized for approximately 35,000-40,000 visit capacity at maturity. Through this project, the clinic will rapidly scale up its operations to the clinic's capacity*

b) Expand primary care clinic hours. *The scheduled slots will increase through the scale – up making expanded scheduled appointment time available. The hours of operation will be adjusted to meet demand.*

c) Expand primary care clinic staff. *New staff will be hired to support scaled-up operations.*

Milestones and Metrics

- P-1: Establish additional/expand existing/relocate primary care clinics
  - P-1.1: Number of additional clinics, expanded hours or space
- P-5: Train/hire additional primary care providers and staff and/or increase number of primary care clinics for existing providers
  - P-5.1: Documentation of increased number of providers, staff and/or clinic sites
- I-12: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services
  - I-12.1: Documentation of increased number of visits

Unique community need identification numbers the project addresses

- *CN.4 – Lack of Primary Care and Pediatric Care*

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.2: Annual monitoring for patients on persistent medications: ACE inhibitors or ARBS for CHF and Diabetes patients
- IT1.12: Diabetes care: Retinal eye exam – NQF 0055
- IT-1.20: Other NQF 1407 - Percentage of patients who by age 13 years were up-to-date with recommended adolescent immunizations: MCV4 and Tdap/Td

Reasons and rationale for selecting outcomes

The tasks for primary care providers are many, including but not limited to – medication management for persistent mediations, appropriate preventive services for chronic disease such as retinal scanning for diabetics and preventive services for adolescents.[124] Among other

[124] American Diabetes Association, Position statement: standards of medical care in diabetes - 2012 Diabetes Care, 2012. 35 (Supp 1): p. S11-S63.

chronic disease and acute care issues, this project will specifically address diabetes retinal exams, monitoring for patients on ACE inhibitors or ARBs, and preventive services for children and adolescents (patients who by age 13 years were up-to-date with recommended adolescent immunizations NQF 1407).

Annual monitoring for patients on persistent medications (ACE inhibitors or ARBS). Congestive heart failure (CHF) and diabetes are our most common diagnoses, resulting in a significant number of patients on chronic medications needing to be monitored to decrease risk of adverse drug events from long-term medication use or misuse of medications. Persistent use of ACE Inhibitors or ARBs warrants monitoring and follow-up by the medical home to assess for side-effects, particularly loss of kidney function, and adjust drug dosage/therapeutic decisions accordingly.[125] The costs of annual monitoring are then offset by the reduction in health care costs associated with complications arising from lack of monitoring and follow-up of patients on long-term medications[126].

Diabetes: Retinal Eye Exam. Diabetic retinopathy, one of the leading causes of blindness in adults, can be treated if detected and addressed in the early stages.[127] Medical teams, using the Wagner Chronic Care Model, will ensure patients with diabetes receive retinal eye exams. Additionally, patients with diabetes who will have access to primary and preventive care that can be coupled with other Parkland services including ADA-certified diabetes self-management classes and pharmacy services provided by pharmacists who are certified diabetes educators.

Primary Care and Prevention: Adolescent Immunizations. Vaccines recommended for children ages 11-12 by the American Academy of Pediatrics, the American Academy of Family Medicine, the Centers for Disease Control and Agency for Healthcare Research and Quality include:

- TDaP vaccine which protects against tetanus, diphtheria and pertussis[128]
- Meningococcal conjugate vaccine, which prevents meningococcal disease (10-14% of invasive meningococcal infections are fatal, and 11-19% result in long-term disability such as deafness, brain damage, or an amputated arm or leg[129]; in the U.S., prevalence of invasive meningococcal disease peaks in infants, with a second peak in adolescents[130])

Relationship to other Projects

This project expands primary care access for the indigent in Dallas County. Parkland intends to balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place. Specific projects related to primary care access include the following:

Unique Project	Project Option	Project Description
127295703.1.2	1.1.2	Expand existing primary care capacity
127295703.1.6	1.1.1	Establish new primary care clinic – Acute Response Clinic
127295703.2.1	2.1.1	Expand Medical Home model
127295703.2.4	2.2.1	Expand chronic care management model

Category 4 related outcomes

- RD-2: Potentially Preventable Readmissions for CHF and Diabetes
- RD-5: Emergency Department
- RD-6: Optional Initial Core Set of Health Care Quality Measures for screenings
    - Annual monitoring for patients on persistent medications
    - Diabetes Care

Relationship to other Performing Providers' Projects and Plan for Learning Collaborative

Other performing provider projects that focus on expanding primary care capacity (Project Option 1.1) include:

126686802.1.2	UT Southwestern Medical Center Faculty Plan

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method to project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.10 on a scale of 9.0. Influencing factors included:

- The large impact this project will have on the Grand Prairie low income population by introducing capacity growth of 40,000 visits over the five years of the project
- Alignment with the community need for primary care capacity expansion
- Cost avoidance providing increased opportunity for patients in this community to obtain the right care in the right place at the right time
- This project is targeted to serve the 65,000 residents of Grand Prairie with income levels less than 200% of poverty.

Benefits of primary care include: prevention, early intervention, fewer preventable ER visits, fewer hospital admissions, improved outcomes, reduced mortality, increased trust and treatment compliance.[131] These benefits have been demonstrated to associate with lowering costs of care from between 20 and 33 percent.[132]

The following sketches the potential range of value that could be produced through the expansion of primary care as contemplated by this project. From this broad reasonableness review, this project value is demonstrated to fit below the comparative value range.

Project Option 1.1.2 – Expand Existing Primary Care Capacity

Unique Project ID: 127295703.1.2

Performing Provider Name/TPI: Parkland Health & Hospital System/TPI 127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. While Parkland's overall payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance, the Community Oriented Primary Care (COPC) clinic network's payer mix includes 62% Charity/Self Pay and 20% Medicaid.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Total Adult	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Parkland directly employs approximately 150 primary care physicians (pediatrics, family medicine, internal medicine) who provide services in the community health centers. Campus based physician services are provided mainly by UT Southwestern Medical Center faculty under a services contract.

Intervention: Expand hours and increase staff and space at select the COPC clinics (Vickery, DeHaro, Garland, and Youth and Family locations) to provide additional access for low income/indigent patients.

Need for the Project: There is significant unmet need for primary care services for the indigent in Dallas County. There are more than one million in Dallas County with income levels at or below 200% FPL (Federal Poverty Level). This project will make a substantial contribution to the new primary care visit capacity in Dallas County. The value of the additional access is leveraged because it will be provided through extended hours of operation provided greater flexibility and convenience to the patients served.

Target Population: The target population includes more than one million residents of Dallas County with income levels at or below 200% FPL, particularly those patients in the catchment areas of De Haro, Garland and Vickery clinics and the Youth & Family (Y&F) clinics. Currently those clinics provide more than 138,000 visits per year.

Category 1 & 2 Expected Patient Benefits: This project will improve access to primary care services for patients with incomes less than 200% FPL in the catchment area of the specified clinics (De Haro, Garland, Vickery and Y&F) by 14,000 visits, broken down as follows:

Volume	DY1	DY2	DY3	DY4	DY5
Baseline (FY 10.31.11)	139,042				
Additional visits		0	7,000	7,000	6,000
Cumulative additional visits		0	7,000	14,000	20,000
Cumulative annual total visits	139,042	139,042	146,042	153,042	159,042

Category 3 Outcomes: The FY2016 outcomes for this project include the following:

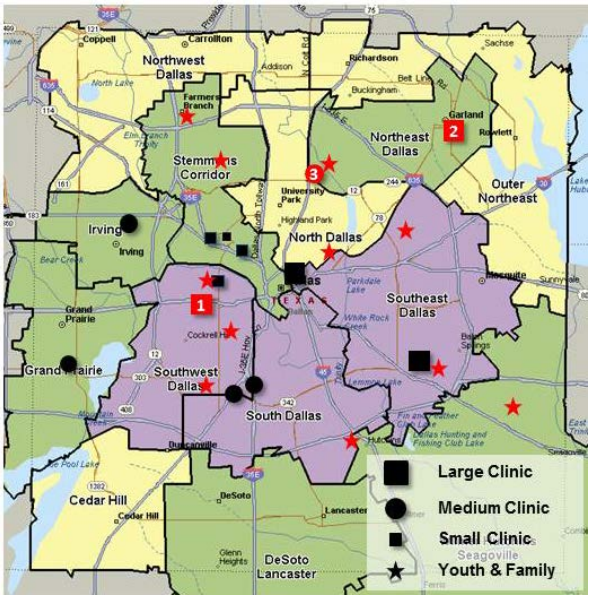
- IT-1.2: Annual monitoring for patients on medications: ACE inhibitors or ARBS
    - Goal is to increase number of monitored CHF and Diabetes Patients
        - CHF: 83.7% (605 patients in FY12) to 88%;
        - Diabetes: 82.5% (2,282 patients in FY12) to 88%
- IT-1.12: Diabetes care: Retinal Eye Exam. Goal is to increase number of COPC patients who receive from 0 to 3,000
- IT-1.20: Other - % patient who by age 13 years up-to-date with recommended immunizations: 1) MCV4 and 2) one Tdap/Td. Goal to increase to 80% compliance. (1,617/2,456 = 66% compliance in FY2012)

Project Description

Expand Parkland's primary care capacity throughout the Community Oriented Primary Care (COPC) network for low income/indigent patients in Dallas County.

Parkland currently provides services in twelve Community Oriented Primary Care (COPC) health centers and eleven Youth and Family centers. This year, Parkland opened a new clinic at the Grand Prairie location and in addition to rapidly scaling up that clinic (127295703.1.1) Parkland has identified the following clinics for expansion of hours, staff and/or space:

- De Haro: recruitment of 1.5 FTEs and 1100 square feet expansion of clinic space
- Garland: recruitment of 2 FTEs
- Vickery: recruitment of 1.2 FTEs and expansion of evening hours of operation
- Youth and Family Centers (school-based) – open 1 clinic and expand hours for 2 others



The adjacent map (Dallas County markets) provides an overview of clinic sites. This expansion serves the Dallas County community, targeting those whose income levels fall below 200% FPL, through improved access to primary care and improved management of chronic disease for the low income/indigent population. Additional staff will provide the capacity to extend hours into evenings and weekends opening more appointment times.

Goals and Relationship to Regional Goals

The goal of this project aligns with the regional goal of increasing access. The expansion of service hours as well as adding providers and staff will increase appointment availability reducing unnecessary emergency department utilization. To increase capacity within the COPC network, this project intends to achieve the following:

- Increase staff, hours of operation and space accommodations for identified primary care clinics to provide an additional 14,000 primary care visits (~10% increase)
- Expand access to same-day service through the Today Clinic model to see patients in a more appropriate setting for their acute health needs
- Incorporate the benefits of several additional projects the chronic care model (127295703.2.4), and the enhancement of the Primary Care Medical Home model (127295703.2.1).

Challenges

Challenges include recruitment of providers to staff clinics through extended hours as well as funding additional costs to insure other resources are available for extended hours. Several of the COPC clinics are in neighborhoods where crime is high and the safety of the patients and staff must be paramount when extending hours into evenings and on weekends. However Parkland is determined to insure additional access and will develop an implementation plan that will address the challenges.

Parkland will address physician shortages by recruiting more mid-level providers and encourage top-of-license performance to insure more patients are treated and that they are provided high quality care.

5-Year Expected Outcome for Providers and Patients

Parkland expects to add capacity sufficient to provide 14,000 additional primary care clinic visits by DY5 for the identified clinics with expansion initiatives.

In addition to increasing the number of patients who can be seen within the COPC primary care clinic system the utilization of a medical home model will provide more coordinated care for patients.

Starting Point/Baseline

In fiscal year 2012, Parkland provided 139,042 visits at the clinics identified for expansion:

- De Haro clinic visits: 53,025
- Garland clinic visits: 50,823
- Vickery clinic visits: 17,858
- Youth & Family clinic visits: 17,336

Total visits: 139,042

Because Parkland is balancing volumes among the COPC network to deal with desperate capacity constraints, it is difficult to determine volume goals by specific clinic at this time. As the ambulatory strategy is more refined, it may be possible to determine goals for each COPC clinic but currently the demand is far beyond the capacity and patients are directed as capacity is available.

Rationale

In Dallas County low income, uninsured, and minority populations disproportionately lack access to care. Dallas County has more than a million residents living at or below 200% poverty, many of whom have very limited access to health services.[136] Parkland is the largest provider of care for the medically indigent in the region; however, the system is at capacity, constraining care throughout the continuum including not only the primary care clinics but the ED and the specialty clinics. In coordination with other Parkland projects, this project will:

1) Increase access at a key entry point – primary care
2) Extend the primary chronic disease management throughout the health system
3) Establish comprehensive care management program that includes a standardized discharge planning process to insure patients are discharged to the appropriate post-acute care setting

[136] U.S. Census Bureau. *2009 American Community Survey*.http://www.census.gov/acs/www/data_documentation/summary_file/

Improve the quality of care provided through sepsis management, decreased readmission rates, improved clinical outcomes for potentially preventable complications, etc.

This project is designed to leverage the investment in new capacity by providing that capacity through extended hours of operation – to provide access in a manner that will provide enhanced convenience and flexibility to the patients served by this project.

How this project significantly enhances an existing care delivery reform initiative

More than 80% of the patient visits provided by the COPC network are for indigent patients and Medicaid beneficiaries. By introducing 14,000 new primary care visits, this project directly supports the need for expanded primary care services for the low income patient population in the neighborhoods already served by the Parkland community health system. Expanding hours, space and staff will provide access to a system of care including a primary care medical home through which same day appointments, episodic and chronic disease management services will provide a comprehensive system of primary care.

The project has no related activities funded by U.S. Department of Health & Human Services.

Project Components

The required project components addressed in this project include the following:

a. Expand primary care clinic space. *Space will be increased for De Haro and Youth & Family clinics.*
b. Expand primary care clinic hours. *Vickery and Youth & Family clinics will extend hours of operation into evenings and/or weekend*
c. Increase primary care clinic staffing. *Recruitment for additional providers (mid-levels) is in process for Vickery, De Haro, and Garland clinics*

Milestones and Metrics

- P-2: Expand community/school-based clinic or expanded hours or space (Y&F)
    - P-2.1: Number of additional clinics or expanded hours or space
- P-4: Expand hours including evening and/or weekend hours (Vickery)
    - P-4.1: Increased number of hours at primary care clinic over baseline
- P-5: Train/hire additional primary care providers and staff (Vickery, Garland)
    - P-5.1: Increased number of providers and staff and/or increase in number of clinics for existing providers
- P-1: Establish additional/expand existing/ relocate primary care clinics (De Haro)
    - P-1.1: Number of additional clinics or expanded hours or space

- I-12: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services
    - I-12.1: Documentation of increased number of visits

Unique community need identification numbers the project addresses

- *CN.4 – Lack of Primary Care and Pediatric Services*

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.2: Annual monitoring for patients on persistent medications - ACE inhibitors or ARBs (Non standalone measure)
- IT-1.12: Diabetes care: Retinal eye exam (Non-standalone measure)
- IT-1.20: Other: % of patients who by age 13 years were up-to-date with recommended adolescent immunizations: MCV4 and Tdap/Td

Reasons/rationale for selecting the outcome measures

The tasks for primary care providers are many, including but not limited to – medication management for persistent mediations, appropriate preventive services for chronic disease such as retinal scanning for diabetics and preventive services for adolescents.[137] Among other chronic disease and acute care issues, this project will specifically address diabetes retinal exams, monitoring for patients on ACE inhibitors or ARBs, and preventive services for children and adolescents (patients who by age 13 years were up-to-date with recommended adolescent immunizations NQF 1407).

Annual monitoring for patients on persistent medications – ACE inhibitors/ARBs. Congestive heart failure (CHF) and diabetes are two of Parkland's most common diagnoses, resulting in a significant number of patients on chronic medications needing to be monitored to decrease risk of adverse drug events from long-term medication use or misuse of medications. Persistent use of ACE Inhibitors or ARBs warrants monitoring and follow-up by the medical home to assess for side-effects, particularly loss of kidney function, and adjust drug dosage/therapeutic decisions accordingly.[138] The costs of annual monitoring are then offset by the reduction in health care costs associated with complications arising from lack of monitoring and follow-up of patients on long-term medications[139].

Diabetes: Retinal Eye Exam. Diabetic retinopathy, one of the leading causes of blindness in adults, can be treated if detected and addressed in the early stages.[140]

Primary Care and Prevention: Adolescent Immunizations. National Quality Forum Endorsed Measure of adolescents 13 years of age who had recommended immunizations by their 13th birthday to include TDaP vaccine which protects against tetanus, diphtheria and pertussis[141] and Meningococcal conjugate vaccine, which prevents meningococcal disease.

Relationship to other Projects

As stated earlier, Parkland fully intends to utilize the opportunities set forth through the waiver to insure its sustainability and viability in the region as the major safety net public hospital serving Dallas County. Parkland will balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place. Without expanding the primary care system, Parkland would be unable to successfully balance the needs of the patients who must seek care throughout the entire health system, thus, all projects are inter-connected elements within Parkland's projects.

Projects specific to expanding primary care include the following:

Unique Project	Option	Project Description
127295703.1.1	1.1.2	Expand existing primary care capacity – Grand Prairie
127295703.1.6	1.1.2	Establish new primary care clinics – Acute Response Clinic

Category 4 related outcomes

- RD-1: Potentially Preventable Admissions for diabetes and hypertension
- RD-2: 30-day Readmissions for CHF and diabetes
- RD-5: Emergency Department
- RD-6: Optional Initial Core Set of Health Care Quality Measures for screenings
    - Annual monitoring for patients on persistent medications
    - Diabetes Care

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 5.75 on a 9.0 scale. Influencing factors included:

- The moderate, but important, impact this project will have on the Dallas County low income population by introducing capacity growth of 14,000 visits over five years
- Alignment with the community need for primary care capacity expansion
- Cost avoidance by providing increased opportunity for patients in this community to obtain the right care in the right place at the right time

The benefits of primary care include: prevention, early intervention, fewer preventable ER visits, fewer hospital admissions, improved outcomes, reduced mortality, increased trust and treatment compliance.[142] These benefits have been demonstrated to be associated with

[142] Robert L Phillips, Jr. and Andrew W. Bazemore; Primary Care And Why It Matters For U.S. Health System Reform; *Health Affairs*, 29, no.5 (2010):806-810

lowering costs of care from between 20 and 33 percent.[143] The following sketches the potential range of value that could be produced through the expansion of primary care as contemplated by this project. From this broad reasonableness review, this project value is demonstrated to fit below the comparative value range.

	DY2	DY3	DY4	DY5	Total
Incremental visits from baseline	0	7,000	14,000	20,000	
Estimated cumulative incremental patients (2.74 visits per patient)	0	2,550	5,100	7,300	
Estimated per capita costs[144]	$8,952.8	$9,807.5	$10,327.3	$10,874.6	
Estimated target population cost	$0	$ 25,009,125	$ 52,669,230	$ 79,384,580	$ 157,062,935
Range of Potential Cost Reductions (20-33%)[145,146]					$ 31,412,587– $ 51,830,769
Project Valuation (Cat 1 + assoc. Cat 3)					$ 25,903,018

Project Option 1.3.1 – Implement Chronic Disease Management Registry

Unique Project ID: 127295703.1.3

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare, and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY 2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Health Center	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention: Parkland will design/ develop/ implement a patient registry that will provide support to providers in managing health care of those enrolled in Parkland's medical homes as well as those patients with chronic care conditions. The registry will support the implementation of an evidence-based chronic care model

Need for the Project: While Parkland has successfully implemented an Electronic Medical Record (EMR) system it is only one piece of the bigger puzzle. EMRs are designed for electronic charting for individual patient information. Their formats are generally hard-coded and are less flexible in expanding and integrating other systems whereas patient registries can integrate specific information from many systems including the EMR, clinical data systems such as lab, radiology and pharmacy systems and practice management systems such as scheduling, billing, online orders, etc. into a useful patient database. Parkland will review current market products and EPIC functionality to determine whether to buy or create a patient registry specific to the

needs of the patient population. According to the Agency for Healthcare Research and Quality, "the term 'patient registry' is generally used to distinguish registries focused on health information from other record sets, but there is no consistent definition in current use."[147]

Better management of patients with chronic conditions is high in the RHP9 region and at Parkland. Approximately 30,000 of Parkland's patient population have or are at high risk of being diabetic and patients with other conditions or comorbidities have also been identified for enrollment in a medical home and chronic care model. Implementing a registry will give providers the tools to monitor/track care of patients with specific needs. Such proactive management of patients will improve quality of care as well as decrease high cost utilization within the healthcare system.

Target Population: Parkland cares for 290,000 individual patients at any given time and approximately 120,000 of those patients are seen in the primary care clinics. Of that, approximately half will be eligible to be enrolled in a medical home and those patients who are enrolled in a medical home will be entered into the system-wide registry – initial projections include 12,000 adults and 12,000 children. Registry elements will be tailored to the medical home model of care for those patients.

A risk-stratification tool will also be incorporated into the registry tool that will segment the population into condition categories to identify those patients who will be enrolled in a chronic care model. As the registry is built, patients with Diabetes, Chronic Kidney Disease (CKD) and Congestive Heart Failure (CHF) and have specific utilization patterns will be enrolled into the chronic care registry – initial projections are estimated at approximately 13,600 - 15,000 patients. As the registry elements are built for specific target populations, patients with COPD, hypertension, pediatric asthma and special needs will be added to the registry.

Category 1 & 2 Expected Patient Benefits: Patients with specific chronic conditions will be identified and monitored through a patient registry that will enable improved care coordination through standardized care protocols, reminders, preventive measures and screenings as appropriate. Initially, the registry will be populated with patients with diabetes, CKD, CHF and will be expanded to include others as the chronic care model is set into place and is successful for the targeted population. By DY5, we anticipate 15,000 to be enrolled in the registry from the identified patient populations (those with Diabetes, CHF, CKD, etc).

Category 3 Outcomes: The goal of any chronic care model is to improve outcomes for patients with certain conditions. The number of patients who will be entered into the registry will be refined until the registry is set up appropriately and has been tested. Due to the initial focus on implementing the chronic care management model for patients with Diabetes, CHF and CKD, Parkland has targeted the following FY16 outcomes for improvement:

- IT-1.2: Annual monitoring of patients on persistent medications (ACE inhibitors/ARBs)
    - Goal is to increase the number of monitored patients on persistent medications

[147] AHRQ. Registries for Evaluating Patient Outcomes: A User's Guide.

        - Diabetes: 82.5% (2,282 patients in FY12) to 88%
        - CHF: 83.7% (605 patients in FY12) to 88%
- IT-1.12: Diabetes: Retinal eye exam
    - Goal: Increase number of diabetic COPC patients who receive from 0 to 3,000
    - Goal: Increase % of Family Medicine patients who receive eye exams from 48% (235/483 patients in FY2012) to 80% in FY2016
- IT-3.3: Diabetes 30-day Readmission Rate
    - Goal: Decrease percentage of readmissions from 9.2% (117 patients in FY12) to 8.7%

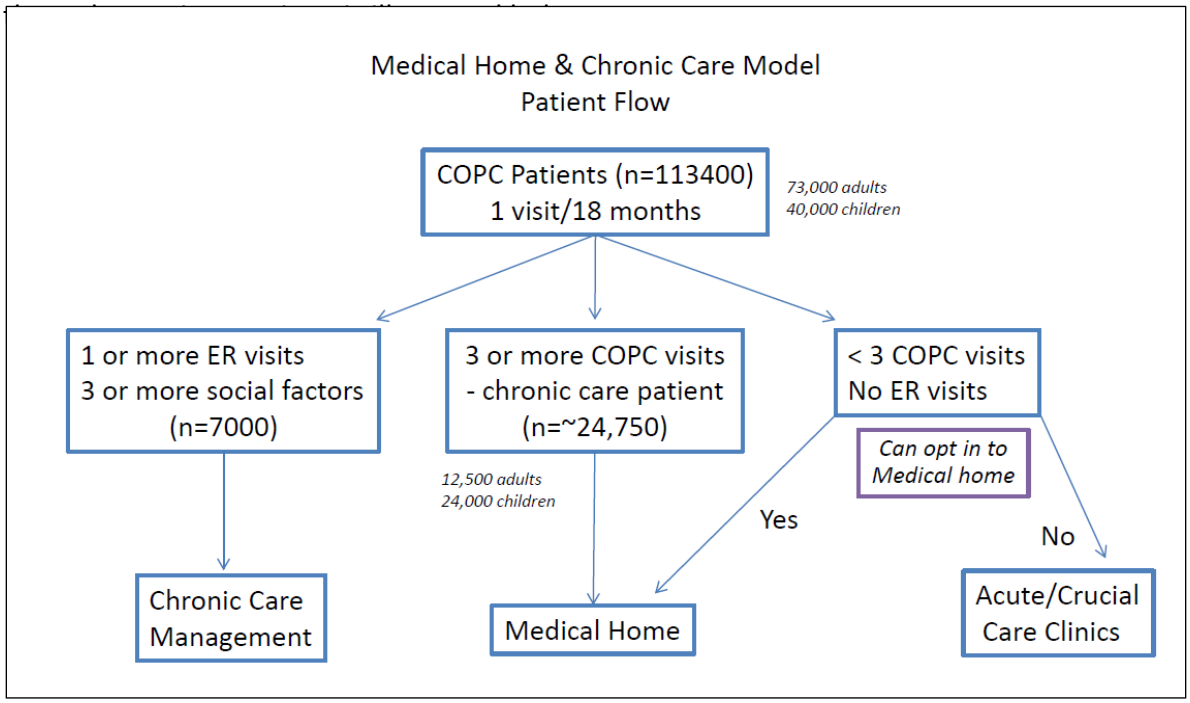
Project Description

Parkland will implement a chronic care registry for patients enrolled in a medical home and patients with targeted chronic conditions. Implementing a registry is a core component of implementation of the chronic care management model (127295703.2.4).

Based on evidence-based elements of chronic care models, a team including providers and nurses and representatives from IT, clinics administration and other stakeholders will focus on the design and implementation of a patient registry that will include registry elements specific to chronic conditions. The following steps will be taken to implement a patient registry:

1. Determine how the registry will be used and which patients will be enrolled
    a. Define targeted chronic conditions
    b. Determine stratification tools to be incorporated with the registry
    c. Determine systems to be integrated with registry (pharmacy, lab, etc.)
    d. Determine data elements required for each purpose of the registry and the current location of those data elements (other systems?)
    e. Tasks and timeline for expanding registry to other sites (specialty care, ED, etc.)

The manner in which patients will be enrolled in a medical home and chronic care model



2. Decide if the registry should be purchased, incorporated into the current EMR system (EPIC) or built. Parkland has implemented an EPIC system which has a library of pre-built registries and analytical Data Marts for prevalent chronic conditions however it is not as flexible and other available options may have the capability to be tailored in a more useful manner.

3. Determine resources required to implement registry. The costs of setting up and managing a registry can be significant and will be considered before committing to a tool. A patient registry requires ongoing collection, integration and management of data and will require resources to insure the registry is adequately supporting the implementation of medical home and chronic care models.

4. Develop an implementation plan (including objectives, tasks, accountability and time lines) that will address implications of implementing the chronic care registry system-wide (inpatient, outpatient, ambulatory, ED, etc.)

Currently, the team has identified 25,000 patients who could be enrolled into the medical home registry and of those, 15,000 with the specified chronic conditions (Diabetes, CHF, CKD, etc.) can be enrolled in the chronic condition registry.

Goals and Relationship to Regional Goals

The goal of this project is to improve care outcomes for patients with chronic conditions, such as diabetes and CHF through the use of an active tool that supports providers and patients in treating their conditions. The tool provides point of care, between care and post care information such as guideline-based intervals for assessment, testing and referrals (eg HbA1c every six months), interventions that are overdue according to clinical guidelines or text from guidelines recommending intervals for care or treatment. It provides information to build an outreach strategy to insure providers appropriately reach out to patients who may need follow up care and it provides reports that providers and their staff can use to insure patients get the right treatment at the right time in the right setting.

The goals for RHP 9 include improved access to care, improved care coordination and management and improved provider performance and outcomes. This project will support coordination of care through effective chronic care management, including the utilization of patient registries to monitor and track care for patients with specific needs.

Challenges

A major challenge in implementing a registry is determining who owns the data collection and ongoing maintenance for the registry. The registry will be utilized by primary care physicians located throughout Dallas County, specialists located in the specialty clinics onsite as well as providers in the hospital's ED and inpatient units. As an organizational strategic initiative, implementing a chronic care registry is at the top of the priority list and accountability for the registry must align with accountability for providing care through the medical home and chronic care models. The identified team is planning to submit recommendations to executive leadership.

With 40,000 inpatient visits and 1,000,000+ outpatient visits annually, another major challenge is the smooth integration of a system-wide registry such that providers across the care delivery system will be aware and utilize the system to insure all services are tracked as these patients are treated across the health system. This will require significant education for providers and staff and should be addressed in the implementation plan for the registry in recommendations to executive leadership.

Long-term, it would provide a community benefit to implement a region-wide registry; however, the challenge would be identifying those patients who need to be enrolled in the chronic care management model, especially as many who do need that treatment for chronic conditions only access care sporadically and may seek treatment at various EDs across the region. The DFWHC has a regional database that provides information on ED visits throughout the region and performing providers are able to review cases where patients are hitting various

EDs for service. This may be an opportunity for collaboration in finding regional solutions to providing chronic care management to patients.

5-Year Expected Outcome for Provider and Patients

The expected outcome will be a significant increase in the number of patients monitored through the registry. Based on the complexities of setting up a system-wide registry, piloting/testing it and then implementing it, the initial set of patients who will be enrolled in the registry will be those who are enrolled in a medical home. Additionally, those identified with diabetes, CHF and CKD will be enrolled. As the registry becomes functional, additional conditions will be targeted and patients with COPD, hypertension, pediatric asthma, etc. will be enrolled.

Starting Point/Baseline

The registry has not been built at this time so the baseline for the number of patients included in the registry is zero (0).

Rationale

While a chronic care management model can be incorporated into practice without a patient registry, the registry provides the key data repository for patient information specific to their condition.

The purpose of the registry is to[148]:

- Describe natural history of disease
- Determine clinical effectiveness or cost effectiveness of health care products/services
- Measure or monitor safety and harm
- Measure quality of care

Electronic registries can assist physicians in key processes for managing chronic disease:[149]

1) Printed patient reports used at point of care provide condition-specific information and prompt physicians/care teams to deliver recommended care/treatment

2) Registry-generated exception reports identify patients who have missed appointments, overdue for care or not meeting management goals

[148] Gliklich RE, Dreyer NA, eds. "Registries for Evaluating Patient Outcomes." (Prepared by the Outcome DEcIDE Center (Outcome Sciences, Inc. d\b\a Outcome), under Contract No. 290-05-0035-1.) AHRQ Publication No. 07-EHC001.Rockville MD: Agency for Healthcare Research and Quality

[149] NAS Consulting Services. Chronic Disease Registries: A Product Overview. California Healthcare Foundation. 2004.

3) Progress reports provide information regarding extend the care teams are doing in delivering care

4) Stratified population reports place patients in risk categories to target interventions for patients with specific needs/risks

Project Components

Required core components for Project Option 1.3.1 – Implement a chronic disease management registry include:

a) Enter patient data into unique chronic disease registry. *Providers leading this effort will identify specific patient populations/conditions that would benefit from being tracked and monitored through a registry*
b) Use registry data to proactively contact, educate, and track patients by disease status, risk status, self-management status, community and family need. *As the registry is being built, specific elements and report capabilities will be incorporated to assist providers in care management of identified patients*.
c) Use registry reports to develop and implement targeted QI plan. *Registry report capabilities will be built and integrated with reportable information that providers can use to improve protocols/treatments/etc.*
d) Conduct quality improvement for project using methods such as rapid cycle improvement. *Parkland will utilize registry information to target improvements in care and will share findings with other providers across health system including providers in subspecialty care clinics and the hospital care transitions team*.

Milestones and Metrics

- P-3: Develop cross-functional team to evaluate registry program
    - P-3.1: Documentation of personnel assigned to evaluate registry program
- P-1: Identify one more more target patient populations diagnosed with specific chronic diseases or with multiple chronic conditions
    - P-1.1: Documentation of patients to be entered into registry
- P-2: Review current registry capability and assess future needs
    - P-2.1: Documentation of review and assessment of future needs
- P-5: Demonstrate registry automated reporting ability to track and report patient demographics, diagnoses, patients in need of services or not at goal
    - P-5.1: Documentation of registry automated report
- P-4: Implement/expand functional disease management registry

    - P-4.1: Registry functionality is available at X% of Performing Provider sites and includes expanded number of targeted diseases/conditions
- P-12: Participate in bi-weekly interactions with other providers and RHP to promote collaborative learning around shared or similar projects
    - P-12.1: Number of bi-weekly meetings, calls, or webinars
    - P-12.2: Share Challenges and solutions
- I-15: Increase percentage of patients enrolled in registry
    - I-15.1: Percentage of patients in registry
- I-19: Spread registry functionality throughout Performing Provider facilities
    - I-19.1: Increase number of clinics/sites associated with Performing Provider's facility that are providing continuity of care for the defined population using the disease management registry functionality

Unique Community Need Identification Numbers the Project Addresses

- *CN.9 – Lack of care management resources for Chronic Disease*

How the Project represents a new initiative

Implementing a chronic care registry is a new initiative for Parkland. The registry will be in support of implementation of a chronic care model throughout the Parkland Health & Hospital System. This will not only provide opportunities for improved care outcomes for those patients but provide information to reduce unnecessary utilization of services by understanding unmet needs of those patients.
The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Care Management

- IT-1.2: Annual monitoring of patients on persistent medications – angiotensin converting enzyme (ACE inhibitors) or angiotensin receptor blockers (ARBs)

- IT-1.12: Diabetes Care: Retinal Eye Exam

OD-3: Potentially Preventable Readmissions

- IT-3.3: Diabetes 30-Day Readmissions

Reasons/Rationale for selecting outcome measures

The outcomes for this project align with those for the chronic care management model project (127295703.2.4) for consistency purposes. Initially, the implementation of the chronic care model will focus on patients with diabetes and CHF and those with Hypertension, thus the following outcomes were chosen:

Annual Monitoring of patients on persistent medications. Hypertension and diabetes are Parkland's most common diagnoses, resulting in a significant number of patients on chronic medications who need to be monitored in order to decrease risk of adverse drug events from long-term medication use or misuse of medications. The costs of annual monitoring are then offset by the reduction in health care costs associated with complications arising from lack of monitoring and follow-up of patients on long-term medications[150].

Diabetes – Retinal Eye Exam. Diabetic retinopathy, one of the leading causes of blindness in adults, can be treated if detected and addressed in the early stages.[151] The registry will provide immediate tracking reports to identify those patients who have and have not received certain tests/exams as recommended. Such immediate feedback will allow immediate notifications to patients to improve compliance with treatment.

Diabetes Readmissions. According to the Texas Health & Human Services 2012 report "Potentially Preventable Readmissions in the Texas Medicaid Population, Fiscal Year 2010" , Texas Medicaid paid for 710,233 inpatients stays (24% of all inpatient stays in Texas) at a cost of $3.3 billion. In the report, the diabetes readmissions rate across the state was 7.8% in 2010 (based on 2,773 initial admissions) and the rate of readmissions increased as the level of severity increased. Readmission rates may actually be higher for public safety net hospitals due to care complexities and costs may be significant as those patients tend to be indigent. The patient registry will provide reportable information to insure providers are prompted to provide recommended treatments that should assist in reducing unnecessary utilization of services.

Relationship to Other Projects

Parkland intends to balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place.

This project supports the project to implement a chronic care management model. Because patients enrolled in the medical home will be in the main patient registry projects related to expanding the medical home are also related. Specifically, projects related to implementation of a chronic care registry include the following:

Unique Project	Option	Project Description
127295703.2.1	2.1.1	Expand medical home model – COPCs
127295703.2.4	2.2.1	Expand chronic care management model

- RD-6: Optional Initial Core Set of Health Care Quality Measures for screenings
    - Annual monitoring for patients on persistent medications
    - Diabetes Care

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Projects to implement a chronic care management registry or care model for patients with certain conditions include the following (Project Option 1.3 or 2.2):

Performing Provider	Unique Project	Project Option
Baylor University Medical Center	139485012.2.2	Expand Chronic Care Management Model – Diabetes (HbA1c poor control, BP control, foot exam)
Baylor Medical Center at Garland	121790303.2.2	
Baylor Medical Center at Irving	121776204.2.2	
Baylor – Carrollton (Trinity)	195018001.2.1	
Children's Medical Center	138910807.1.3	Implement pediatric chronic disease registry
Denton County Health & Human Serv	136360803.2.1	Implement disease registry – diabetes
Methodist Charlton Medical Center	126679303.2.1	Expand Chronic Care Management Model – Diabetes (30-day readmission, Hba1c, BP control)
Methodist Dallas Medical Center	135032405.2.2	
Methodist Richardson Medical Center	209345201.2.2	
Texas Health Presb Hospital Denton	020967801.2.2	Expand Chronic Care Management Model: Diabetes (HbA1c poor control, Readmissions)
Texas Health Presb Hospital Kaufman	094140302.2.2	
UT Southwestern – Faculty Practice	126686802.2.2	Expand Chronic Care Management

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 7.65 on a 9.0 scale. Influencing factors included:

- Parkland serves more than 290,000 Dallas County residents annually, of which 48% are unfunded and 31% are Medicaid recipients
- The strong impact this project will have with respect to identifying, at the health system level, the patients among Parkland's vulnerable population, at highest risk for preventive and maintenance services
- Alignment with the community need for chronic disease management
- Cost avoidance by providing increased opportunity for patients in this community to obtain the right care in the right place at the right time
- Opportunities for partnership and collaboration with the many performing providers in RHP 9 that are pursuing the chronic disease management projects

This project facilitates the implementation of chronic disease models, protocols and disease-specific preventive and monitoring interventions. The value of this project is integrally related to the successful achievement of the chronic disease aspects of those projects and the value of their outcomes.

Project Option 1.10.4 –Quality Through Transformation Initiative ("QTTI")
Substantially Modified from December 31 Submission

Unique Project ID: 127295703.1.4

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention: This project implements the Quality Through Transformation Initiative ("QTTI") which will provide the infrastructure, governance and integrated oversight for Parkland's sixteen Waiver projects and will provide leadership and consultative support for the Region's transformational projects, learning collaboratives and integrated improvement outcome achievement.

Need for the Project:

This project will assure that the dedicated focus is applied and necessary resources are assembled to achieve successful Waiver project implementation inside Parkland and to provide coordinative and consultative support for the efforts of RHP 9 as a whole.

Target Population: Generally, the target population includes all Parkland patients (290,000 unique patients annually) with specific focus on inpatients (37,000 discharges) and ED utilizers (approximately 200,000 visits per year). Specifically, this project will impact the patients targeted by each of the Parkland Waiver projects and those of the region.

Category 1 & 2 Expected Patient Benefits: The main benefit includes a significant improvement in the care delivery system for patients who seek care at Parkland. Successful implementation of the transformational initiative through the waiver will insure that the barriers to care are addressed across the health continuum and aligned with organizational strategy to improve the care delivery system. The result will include improved patient outcomes through right care, right setting, right provider.

Category 3 Outcomes: The goals include the following FY16 outcome improvements:

- IT-9.2: ED appropriate utilization
    - Reduce number of low acuity ED visit by 50%

Project Description

Parkland will implement the Quality Through Transformation Initiative ("QTTI") to provide focused governance and resourcing to promote successful completion of Parkland's Waiver projects and to support transformation achievement across the RHP 9 region.

The Quality Through Transformation Initiative ("QTTI") will create, staff, and provide technology support for a core team that will guide, monitor and support each of the Parkland Waiver projects. Because this initiative embraces each of the Waiver's evidence-based project options 1.10.1, 1.10.2, and 1.10.3, Parkland requests that the three options be consolidated into a combined evidence-based project option characterized as 1.10.4. The core components of each of the individual options will be rolled up and addressed as core components for this project option.

The QTTI project activities will include:

Needs Assessment and Plan: A review of the Parkland Waiver projects and the RHP 9 Plan to produce a requirements definition for governance and oversight, project management, range and depth of content expertise, training and educational activities, technology requirements, collaborative process support and other related duties and functions. From this review, an implementation plan will be developed which will include: governance, project management

structure and staffing, content expert staffing, technology resourcing, training and education resourcing and facilities requirements. Within the plan, specific determinations will be made for each element as to whether to leverage existing or recruit/import new resources.

QTTI Activation: The implementation plan will be expeditiously completed and the initiative will be activated providing the internal and RHP 9 functionality as defined and required.

When activated, the QTTI team will:

- Formally charter each of the Parkland Waiver projects, establish appropriate resourcing for each initiatives including role, functions and accountabilities for each project team member.
- Review and prepare detailed work plans that align with and will successfully achieve the process milestones associated with each project
- Review the metrics associated with each project and associated outcome measure. Assure data capture methodologies are established, prepare data verification / validation procedures, and assure provision of reporting methodologies and resources. Create project performance dashboards and monitors that roll up to collective performance views.
- Establish a global and project-specific communication plans and assure provision of associated communication and sharing technologies. Provide for communication feedback loops for project team members and for Parkland system employees as large to identify issues that may impact project success or have impact on existing operational functionality.
- Establish and deploy performance improvement and change management experts, prioritize resourcing, customize Parkland-standard PI tools and methodologies to the individual characteristics of each project.
- Provide education and training regarding the PI methodologies, tools and expected outcome to Parkland senior leaders and project leadership and staff members. Provide just-in-time training, coaching and course correction mapping as appropriate.
- Consult on RHP 9 plan implementation; provide leadership for performance improvement, collaborative learning and other inter-institutional activities.

While this project is characterized as an initiative, through the course of DY2 through DY5, it is intended that the QTTI will model, bridge and become institutionally hardwired – the system transformational infrastructure and framework.

Goals and Relationship to Regional Goals

This project is intended to enable successful achievement of the Parkland Waiver projects and to provide integral support the achievement of the RHP 9 plan – at the individual entity level and for the collective performance of the region.

Challenges

The size and scope of this project presents a considerable challenge to the Parkland organization. It will require the serious direction of the Parkland executive leadership team to assure that it is vigorously supported, resourced well (people, supplies, expertise, technology) and enabled to function at a cross-system level. Given the importance of the Waiver program to Parkland and the region, it is anticipated that this challenge will be fully met.

It will also be important that this initiative become institutionalized in terms of its approach, function, methodologies and transformational thrust. The governance and oversight of the Waiver projects will provide the opportunity to trial, improve and perfect the functional performance of transformational project work. Interaction with teams from other RHP 9 entities and with RHPs across the state will further infuse collaborative learning and growth.

5-Year Expected Outcome for Provider and Patients

The 5-year expected outcome is a significant improvement in the care delivery system for patients who seek care at Parkland. Successful implementation of the transformational initiative through the waiver will insure that the barriers to care are addressed across the health continuum and aligned with organizational strategy to improve the care delivery system. The result will include improved patient outcomes through right care, right setting, right provider.

Starting Point/Baseline

This project is a new initiative. There is no current office to support implementation of strategic transformational initiatives. Thus, the starting point/baseline is zero. The projects being submitted are inter-related through the care continuum and the ultimate goal for the culmination of these projects is the right care, right setting, right time and right provider. The metric by which Parkland can measure this would be ED appropriate utilization. If patients are receiving care in the appropriate setting, unnecessary ED utilization will be reduced.

Rationale

The organized effort that will be required to successfully perform the Waiver projects at Parkland and for the region, will required a dedicated function/initiative that is well resourced and supported. This project will insure that the inter-related projects meet the ultimate goal which is insuring patients receive right care, right setting, right time and right provider. The metric by which Parkland will measure this would be ED appropriate utilization. If patients are receiving care in the appropriate setting, unnecessary ED utilization will be reduced.

Quality and performance improvement requires substantial initial investments in people, technology and systems. It is anticipated that the costs will be offset by the return through efficiencies and cost savings brought on by improved care. The Agency for Healthcare Research and Quality recommends hospital systems utilize strategic management of human resources (as

the largest expense for organizations) to make strategic choices about which improvement initiatives to pursue and how best to implement these initiatives.[152]

For Parkland to be successful in transforming the care delivery system, an organizational commitment to the oversight of the waiver implementation strategy will provide the enterprise the opportunity to align all initiatives in one direction which will ultimately result in a balanced care continuum.

Project Components

For Parkland, the function is being redesigned and thus intends to meet core components of the three project options (1.10.1-1.10.3) through Project Option 4 as an "Other" project option:

Enhance improvement capacity through people (1.10.1), technology (1.10.2), systems (1.10.3):

a. Provide training to clinical and administrative staff on PI strategies, methodologies and culture. *Initial investment in recruitment of staff will be made and as new employees are recruited, they will be trained and educated regarding best evidence-based practice regarding performance improvement. This training will provided will also be extended to Waiver project teams to inform and enhance their work.*
b. Develop employee suggestion system that allows identification of issues that impact work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement. *An open, bilateral communication plan will be deployed to solicit input and feedback among Waiver project teams, across the Parkland system and across the RHP 9 Waiver performing providers and stakeholders.*
c. *(1.10.2-specific):* Design data collection systems to collect real-time data used to drive quality improvement. *Data systems will be required to collect and organize data specific to the Waiver projects and their outcome measures.*

Milestones and Metrics

- P-1: Establish PI Office to collect, analyze, manage real-time data and monitor improvement trajectory and improvement activities
    - P-1.1: Establish office
    - P-1.2: Office engaged in collecting, analyzing real-time data
    - P-1.3: QI activities
- P-6: Hire and train "QTTI" staff in proven QI principles, tools, process

[152] Agency for Heathcare Research and Quality 2012. Using Workforce Practices To Drive Quality Improvement : A Guide for Hospitals http://www.ahrq.gov/qual/workforceguide.html

    - P-6.1: Staff trained
- P-5: Enhance/expand organizational infrastructure & resources to store, analyze, share patient experience and/or quality measures data; utilize them for quality improvement
    - P-5.1: Increased collection of patient experience and/or quality measures data
- P-X.1: Insure implementation plan aligns with New Parkland transition plan so sustainable implementation will be addressed through the transition to New Parkland
    - P-X.1 New Parkland Transition Plan addresses transformational initiative and vice versa
- P-4: Participate in/present to quality/performance improvement conferences, webinars, learning sessions or other venues
    - P-4.1: Number of learning events attended and number of learning events at which a presentation was delivered summarizing the providers improvement activities and results
- I-8: Create a quality dashboard to be shared with organizational leadership and at all levels of the organization on a regular basis that includes outcome measures and patient satisfaction measures
    - P-8.1: Submission of quality dashboard

Unique community need identification numbers the project addresses

- *CN.11 - Patient Safety and Quality*

How the project represents a significant enhancement to an existing delivery system

This project will leverage and extend current QAPI capabilities establishing and hardwiring the capabilities of the Parkland organization to tackle, successfully perform and achieve the intended outcomes of transformational projects. In addition to achieving the results of the Parkland Waiver projects and supporting the successful performance of the region, the Parkland system will have established a sustainable functional strength that will enable the organization to continue transformational improvement beyond the term of the Waiver.

Related Category 3 Outcome Measure(s)

- OD-9: Right Care, Right Setting
    - 9.2: ED appropriate utilization

Reasons/Rationale for selecting outcome measures

ED Appropriate Utilization is the main element of the Parkland care continuum. It determines the majority of admissions to the hospital as well as the referrals to the primary and specialty care clinics. A recent ED Study found that 40% of ED visits were for patients with low acuity

needs. At any given point, Parkland's ED is at 300-400 patients awaiting care. The ED has been at and over capacity causing backlogs at every point in the system. If access were available to patients at other appropriate settings such as primary care and specialty care clinics, and possibly urgent clinics, the ED congestion could be minimized providing access to those patients who truly need emergency services. This project focuses on balancing the care continuum and the ED is the scale pillar which determines the balance of patient flow. Addressing this will drive a significant opportunity to calibrate the other elements of the continuum.

Relationship to Other Projects

As stated above, Parkland intends to balance the care continuum. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place, thus this project directly relates to each of the Parkland projects.

Category 4 Related Outcomes

- RD-5: Emergency Department

Relationship to Other Performing Providers' Projects and Learning Collaborative
This project is intended to provide RHP 9 leadership and consultation for performance improvement, collaborative learning and other inter-institutional activities. There are no other similar RHP9 projects.

Parkland will be an active leader and participant in the development and ongoing conduct of Project Learning Collaboratives appropriate to this project, as organized by RHP 9 and described in Section IV - Stakeholder Engagement. Parkland will participate in any Outcomes Learning Collaborative associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.6 on a 9.0 scale. Factors that influenced this score included:

- The transformational impact that this project will have on the Parkland system and its ability to fulfill its mandate to provide excellent and safe care the medically indigent patients in Dallas County – more than a quarter of a million served annually

- Alignment with the community need to advance patient safety and reduce harm caused to patients in the health care setting
- Alignment with RHP 9 goals of improved provider performance and outcomes
- Cost avoidance through improvements in quality and safety that reduce error, duplication and rework
- Cost avoidance through improvements in quality and safety that reduce error, duplication and rework

Specifically, this project is anticipated to directly support the achievement of the Parkland Waiver initiatives, create a hub for transformational work within the Parkland system.

The extraordinary growth in Parkland's ED volume over the four year period from 2010 to projected 2013, presented in the chart below, is a demonstration of a regional health system that is out of balance.

	2010	2011	2012	2013P
ICC	18,566	19,324	20,578	22,137
Psych ED	9,516	10,027	6,819	6,989
Urgent ED	52,418	54,337	53,357	52,667
Main ED	96,928	109,663	115,193	128,752

Successful achievement of the Parkland and the regional Waiver projects will bend the curve of patients seeking care in the most expensive setting. With a conservative estimated excess cost per ED visit of $500, a reduction of approximately 19,000 inappropriate ED visits per year over 4 years would equate to the project value assigned to this project and its associated outcome measure.

Project Option 1.9.2 – Expand Specialty Care Capacity

Unique Project ID: 127295703.1.5

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention. In order to improve access to specialty care, Parkland is developing a data-driven gap analysis to determine the priority services to be expanded based on patient demand and barriers to access those services. With constrained capacity at every entry point, Parkland must balance the care continuum – as primary are access is increased specialty access must also increase to meet the demand of those patients who must be referred. Additionally, a percentage of inpatients get referrals to specialty services after discharge and as the initiatives for care transitions and patient navigation are implemented, the increased need for services must be considered.

Several clinics have already been identified for focused efforts to improve access and others will be included as appropriate. Implementation plans, including workforce plans and/or plans for recruitment of mid-levels providers, extended hours of operation, etc. will be developed to insure improved access to those services.

Need for Project. Parkland provides almost 1 million clinic visits (62% unfunded/19% Medicaid) and 200,000 ED visits (64% unfunded/22% Medicaid) annually. Currently referrals to specialty care are beyond capacity and patients experience long waits for appointments which drives many to seek care in the ED. The ED is at capacity with approximately 40% of the volume requiring a lesser level of care that could be provided in an ambulatory/outpatient care setting.

Target Population. The specialty clinics provided 345,000 visits in FY2012 and currently more than 80% of the patients seen in Parkland's ambulatory clinics are unfunded/Medicaid. Preliminary review has shown that the following specialty clinics have constrained access and will be the initial focus for this project: General Surgery/ Evaluation, Dermatology, Ophthalmology, Diabetes, GI/Liver, Cardiology, and Neurology. These clinics provided approximately 75,000 visits in FY2012 but demand is beyond capacity and many patients are on wait lists. Wait lists can be out as many as 400 days for some clinics. With improvements made through this project, projected capacity will be 91,000 visits in DY5.

Category 1 or 2 Expected Patient Benefits. This project seeks to increase specialty care access in accordance with the expansion of primary care, expanding the medical home model and the chronic care model throughout the Parkland care delivery system. This will provide not only better access but overall improved care coordination and management by providing necessary services in a more timely manner to alleviate unnecessary visits to the ED or readmissions to the hospital.

Category 3 Outcomes/Goal. Expanding specialty care should provide the following outcomes:

- IT.1.1: Improved access reported through third next available appointment. Goal is to decrease days to third next available as determined for each clinic.
    - General Surgery: 280 to 205
    - Surgery Evaluation: 280 to 205
    - Ophthalmology: 181 to 132
    - Dermatology: 211 to 162
- IT-9.2: Appropriate ED utilization. Goal is decrease inappropriate ED utilization of patients in medicine clinics (GI/Liver, Neurology, Cardiology, Diabetes) by 15% in DY5 (baseline 7,198 ED visits for patients in those clinics)

Project Description

This project will improve access to specialty care at Parkland through identification of highly demanded specialty service (gap analysis) and implementation plans to reduce barriers.

In FY2012, Parkland provided approximately 345,000 specialty clinic visits (an increase of 7% from FY2011) and although wait times for some clinics are within benchmark standards, others are not. Parkland has initially identified several specialty clinics that require a concerted effort to improve access. A data-driven gap analysis will determine other priority services based on patient demand and barriers to access those services. Implementation plans, including workforce plans, to expand services will be developed to improve access to those services.

Based on wait lists and appointment wait times, the number of requested referrals and demand from other clinics within and outside of Parkland's health system, the following medical and surgical specialty clinics have been identified for initial focus in improving access:

- Diabetes
- Cardiology
- GI/Liver
- Neurology
- Smoking Cessation
- General Surgery
- Ophthalmology
- Dermatology

The focus of this project is to implement plans to improve access in these clinics. Additionally, Parkland is focusing on prevention and a large majority of patients are smokers which is general knowledge that increases risk of cardiac, respiratory and other diseases as well as exacerbates conditions such as diabetes.

Goals and Relationship to Regional Goals

The goal of this project is to increase access to specialty care, especially for those with low incomes (<200% FPL).

Regional goals include improved access to care, care coordination and management and provider performance and outcomes. Expanding specialty services will meet the goals of improving access if the necessary resources can be obtained and will also improve care coordination and management. Many patients within Parkland's health system have learned their way around waits in certain clinics by finding other doors into the system (such as the ER) which causes backlog and inappropriate use of sites of care.

Through this project, implementation plans will be executed to insure better coordination of care to minimize patients having to find other ways to get the care they need when they need it. This will improve access in the appropriate care settings for everyone.

Challenges

One challenge for Parkland is the increasing demand for specialty care. Currently some of the specialty clinics have long waits for appointments and many patients seek care in the ED to avoid those waits, thus the ED is at capacity and the new hospital's ED will not be sufficiently expanded to meet increasing demand. Parkland is conducting a gap assessment that will direct a data-driven prioritization of the services that must be expanded and then develop a robust implementation plan with the appropriate financial projections

Another challenge is the regional physician shortage. With the physician shortage in Texas expected to increase from 30% to 50% by 2016, as identified in the Community Needs Assessment coupled with the substantial demand for care by the low income population, many seek care in the ED. This increases costs and causes capacity bottlenecks for emergencies. Parkland intends to do a comprehensive market assessment to determine specialty care needs for those who may seek care in the ED but have lower acuity needs that could be better addressed in an ambulatory care setting. Parkland is also recruiting mid-level providers to assist in providing care necessary in the specialty clinics.

Additional challenges include collecting accurate and consistent data to measure progress to goals and patient scheduling systems, policies and protocols. A team of data and clinical subject matter experts will determine the best way to quantify the next routine appointment indicator that is required for Metric 1 (I-30.1). This data must be standardized throughout the outpatient system and provided as a reportable outcome by which to measure performance.

5-Year Expected Outcome for Provider and Patients

Parkland's volume projections for outpatient care in FY2015 were approximated at 450,000 specialty clinic visits. This demand cannot be met with the current restraints (space, physician workforce, staffing, etc.), so Parkland is identifying those services that should be expanded and a time line for the expansions. The expected outcome will improve access for many patients who are waiting to get specialty care treatment. If the access to specialty care is improved, ED overutilization and readmissions will be reduced. Improving access to specialty services is one step in balancing the continuum at Parkland as more patients are directed to the appropriate setting for their care needs.

Starting Point/Baseline

In FY2012, there were 344,840 total specialty visits to the Parkland Outpatient Center on the main campus. The baseline clinic visit volumes for the identified clinics to be expanded are as follows:

Specialty Clinic	FY2012 Clinic Visits
Diabetes	4,091
Cardiology	10,488
GI/Liver	5,625
Neurology	6,813
General Surgery/Evaluation	3,219

Ophthalmology	32,574
Dermatology	12,987
Smoking Cessation	700
Total	**75,797**

Rationale

In Dallas County, few private specialist physicians accept Medicaid and indigent patients. Parkland is the main resource for specialty care and follow up for both medical and surgical subspecialties. As estimated below, the estimated demand for adult medical and surgical subspecialty care in Dallas County far exceeds the 345,000 visits currently provided.

Demand Elements	Medical Subspecialty	Surgical Subspecialty	Total
Rates of ambulatory care visits per hundred persons[153]	74.6	66.4	
Percent adult to total population in Dallas County (2011)[154]	72.2%	72.2%	
Estimated Dallas County population under 200% poverty[157]	1,063,000	1,063,000	
Estimated subspecialty visit demand	571,000	509,600	1,080,600
Parkland medical/surgical subspecialty visit volume			345,000
Subspecialty visit shortfall			735,600

As demonstrated, there is a critical shortage of subspecialty services for adults and, as a result, the emergency department often serves as the access point for needed services.

Additionally, a large percentage of Parkland patients have chronic conditions, such as diabetes and require ongoing treatment. With clinics at capacity, even if a patient can get in within a reasonable time once, their next appointment could be months out and that is not condusive to a regimented treatment schedule for patients who require ongoing care. Patients must be able to access services if clinical protocols for treating their condition are to be successful. This includes not only speicalty clinics but primary care medical homes, lab for blood draws, pharmacy, etc. For instance, some patients on specific medications must have a visit with their physician to get refills and if the physician's schedule can not accommodate, those patients will go to the ER to insure they get their medications or in unfortunate circumstances, they quit their medications which can have detrimental results. The backlog in referrals for speicalty services at PArkland thus contribute to unnecessary utilization of the ED.

Another issue has been related to scheduling and no shows. Some patients will make appointments months out and hold those appointments even if they end up not needing them

[153] Ambulatory Medical Care Utilization Estimates for 2007; US Department of Health and Human Services, Centers for Disease Control and Prevention; National Center for Health Statistics

[154] U.S. Census Bureau

any longer (just in case) – or they will forget the appointment – either way they may not show up for whatever reason. So appointment slots are held sometimes for months leaving other patients no choice but to shcedule even further out. No shows then cause negative effects on operations. This becomes a daily problem for the clinics, as well as for those patients who could have been seen had the appointment from the no show been cancelled.

With increased waits for specialty care at Parkland, more patients seek care in the ED and although Parkland's ED volumes are excessive at approximately 200,000 visits per year, the percentage of those who could be seen in a lower acuity setting is 40%. In order to alleviate the constraints on the ED and prevent other unnecessary utilization of services, Parkland is focusing efforts on expanding specialty care services that currently have long wait lists.

Project Components

Project components include the following from option 1.9.2 Improve Access to Specialty Care:

a) Increase service availability with extended hours. *The gap analysis identifies several medicine and surgical services that require extended hours of operation or additional physicians and staff. Additional clinics will be included in the project as appropriate.*
b) Increase number of specialty clinic locations. *The gap analysis identifies the services that may require additional space or locations. Facility plans for the new outpatient care building are in process* and depending on the decisions regarding facility planning the clinics that will be targeted for expansion may change and will be added to project.
c) Implement transparent, standardized referrals across system. *Improvement of the referrals system will be addressed through a team to include Patient Access Services, Information Technology and outpatient care leaders. Transition planning is also in process regarding New Parkland and operational changes that will be addressed as services are moved to the new facilities.*
d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned", opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *Learning collaboratives with other providers within the health system including primary care providers and ancillary providers will be utilized to share findings/lessons learned in continued improvement of the care delivery system and patient flow*.

Milestones and Metrics

- P-1: Conduct specialty care gap assessment for services based on community need
    - P-1.1: Documentation of gap assessment. Demonstrate improvement over prior reporting period (baseline for DY2)
- P-3: Collect baseline data for wait times, backlogs, and/or return appointments in specialties
    - P-3.1: Baseline for performance indicator
- P-12: Implement a specialty care access plan to include such components as statement of problem, background and methods, findings, implication of findings in short and long-term conclusions
    - P-12.1: Documentation of specialty care access plan
- P-X: Recruit mid-levels, providers and supporting staff for specified clinics
    - P-X1: Recruitment of identified staff per clinic
- I-23: Increase specialty care clinic visit volume; evidence of improved access for patients
    - I-23.1: Documentation of increased number of visits. Demonstrate improvement over prior reporting period (baseline for DY2)
    - I-23.2: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline DY2)

Unique Community Need Identification Numbers the Project Addresses

- *CN.8: Specialty Care*. Demand for specialty care services exceeds the current supply

How the Project significantly enhances an existing delivery system reform initiative

While Parkland has expanded some specific services in the specialty care clinics, this project provides the opportunity to perform a global assessment and gap analysis to develop a more comprehensive and focused strategy in addressing the specialty care capacity issues.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.1: Third next available appointment (Non-standalone Measure)

OD-9: Right Care Right Setting

- IT-9.2: ED Appropriate Utilization

Data driven reports that identify third next available appointment wait times is one method to show that expansion of services has been effective. While Third Next Available appointment is not a "good" measure for Parkland's system, it is the industry standard and one which Parkland

is attempting to define for its specialty services. It will provide some measure by which to determine success of initiatives to increase access to care. Another method to determine that is use of the ED for low acuity services. A recent report of ED utilization at Parkland showed 40% of ED visits were low acuity and could have been treated in an ambuluatory setting. If specialty access is improved, ED utilization for low acuity care should be reduced.

Both outcomes can be reported to measure Parkland's performance, which aligns with the regional goal to improve provider performance and outcomes.

Relationship to Other Projects

Parkland intends to balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place. Increasing specialty care is an integral component in the care continuum and constrained access increases unnecessary utilization of other services in the continuum (ED, inpatient, etc.)

Projects related to increasing access throughout the care delivery nclude:

Unique Project	Option	Project Description
127295703.1.1	1.1.2	Expand current primary care capacity – Grand Prairie
127295703.1.2	1.1.2	Expand current primary care capacity

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Related projects (Project Option 1.9) from RHP 9 performing providers include the following:

Performing Provider	Unique Project
Baylor Medical Center at Carrollton	195018001.1.2
Baylor Medical Center at Garland	121790303.1.2
Baylor Medical Center at Irving	121776204.1.2
Baylor University Medical Center	139485012.1.2
UTSW – Faculty Practice Plan	126686802.1.5
UTSW – Faculty Practice Plan	126686802.1.11
UTSW – University Hospital	175287501.1.1

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration.

This project had a weighted average score of 8.05 on a 9.00 scale. Factors that influenced this score included:

- The large impact this project will have on when aligned with the primary care expansions required to meet demand
- Alignment with the community need for specialty care capacity expansion
- Cost avoidance by providing increased opportunity for patients in this community to obtain the right care in the right place at the right time (avoid unnecessary ED visits and admissions, readmissions)

As discussed earlier, the significant capacity shortages for adult subspecialty services create a critical need in Dallas County. This project provides incremental capacity to mitigate this significant need.

Parkland directly employs approximately 150 primary care physicians (pediatrics, family medicine, internal medicine) who provide services in the community health centers. Campus based physician services are provided mainly by UT Southwestern Medical Center faculty under a services contract.

Intervention: Establish one or more new clinics to provide post-acute referral primary care to Parkland system patients who require post-discharge follow-up from inpatient, emergency or other episode of care but are not been established with a primary care provider or cannot secure timely primary care follow up.

Need for the Project: With an inadequate supply of primary care capacity available to individuals living at or below 200% of poverty, patients requiring primary care follow up from

acute or episodic conditions are unable to obtain timely care in the most appropriate setting. Parkland estimates indicate that the demand originating in the Inpatient and ED for such services could be at or greater than 50,000 annual visits.

Target Population: Parkland cares for more than 290,000 unique patients annually, of which 80% are indigent/Medicaid. This project will target Parkland system patients who require acute or episode-related primary care follow up care and who do not have a regular source of primary care or unable to secure a timely appointment with their regular source of primary care.

Category 1 & 2 Expected Patient Benefits: Parkland will create additional primary care access that will provide follow up care for patients discharged from the inpatient, emergency department, or other setting. The patient will obtain the right care at the right time in the right setting which will facilitate resolving the acute or episode-related condition. When concluding care in this setting and as appropriate, patients at high risk for recurrence or having unrelated health risks and who would benefit from continuous management will be risk stratified and referred, as appropriate, to Parkland or other community-based medical home settings.

Improved access to services through the acute response care clinics will trend as follows:

Volume	DY1	DY2	DY3	DY4	DY5
Baseline (FY 10.31.11)	0				
Total Clinic Visits	0	0	0	20,000	40,000

Category 3 Outcome: While the clinic will provide additional capacity of approximately 40,000 by DY5, the targeted outcome for FY2016 for this project has been identified as follows:

- IT-3.1: All Cause 30-day Readmission Rate – NQF 1789.
    - Goal is to decrease from 8.74% (2,770 patients in FY12) to 8.5%

Project Description

Establish one or more post-acute referral primary care clinics to provide primary care follow up from an acute or episodic condition to Parkland system patients who do not have a regular source of primary care or cannot secure a timely appointment from their regular source of primary care.

This project seeks to establish a coordinated solution to two related problems that affect both the Parkland health system and the patients it serves.

Problem 1 – There is a need to establish reliable access to post-discharge primary care follow up services for hospital inpatients which would contribute to reductions in hospital readmissions and/or returns to the emergency room. Evidence clearly demonstrates that inpatient readmissions within 30 days are frequent, preventable and costly. Further evidence

demonstrates that approximately 2% of all emergency department visits were made by persons discharged from inpatient care within the last 7 days.[155]

Problem 2 – There is a need to establish post-discharge primary care follow up appointments for emergency department patients which would contribute to reductions in post emergency department discharge returns to the ED. Of the 110 million annual ED visits in the United States, approximately 45% of patients are referred for outpatient follow-up ensuring treatment continuation. Appointments made at discharge from the ED have a significantly greater probability of follow-up compliance compared with patients given standard discharge instructions.[156]

This project proposes to introduce a new primary care resource that will provide a reliable supply of primary care follow up resources to patients being transitioned through the inpatient and emergency discharge processes – the targeted patients would be those for whom primary care follow up is appropriate and for whom there is no existing primary care resource or for whom that primary care resource does not have timely availability. Using broad indicators, these patients may appropriately require 50,000 primary care acute follow up visits annually.

Patients seen in this post-acute referral primary care clinic who have chronic disease conditions, are at risk for ongoing complications, or for whom a continuous primary care relationship would be valuable will be referred to a Parkland clinic or other community medical home setting, as available.

Goals and Relationship to Regional Goals

This project aligns directly to address the primary care capacity need identified in the Community Needs Assessment and specifically provides new primary care capacity to continue patient care management for patients who have presented with acute or episodic conditions requiring follow up. Adjunctively, this project will leverage the effectiveness of improved care coordination resources and facilitate standardized care transitions from inpatient and emergency settings.

Challenges

As stated in the Community Needs Assessment, the State and region in which RHP 9 resides has significant shortages of primary care physicians. When considered in the context of other primary care expansion projects, this endeavor will further strain Parkland's ability to recruit the provider and allied clinical staff required to implement this project. However, Parkland has a well-established recruitment process and pipeline that should alleviate those challenges.

[155] Emergency Department Visits by Persons Recently Discharged from U.S. Hospitals, National Health Statistics Reports, Number 6, July 24, 2008.

[156] Factors Affecting Outpatient Follow-Up Compliance of Emergency Department Patients, Journal of General Internal Medicine, 2005; 20:938-942.

5-Year Expected Outcome for Providers and Patients

This project will provide a significant and valuable new primary care resource to Parkland and the patients it serves. By DY5, it is estimated that the clinic(s) will be providing 50,000 or more new primary referral follow up visits. With additional new capacity, this project will contribute to reductions in all cause readmissions and returns to the Emergency Department.

Starting Point/Baseline

As a new primary care intervention specifically targeting post-acute discharge patients requiring primary care follow up, the baseline for visit volume is zero.

The baseline performance with respect to the percent of targeted discharge patients obtaining primary care follow up appointments will be developed in DY2.

Rationale

Primary care follow-up after acute care (inpatient or emergency) ensures proper treatment continuation of the initial condition; identifies misdiagnoses, treatment failures and complications; and supports patient compliance with the therapeutic plan. In a University of Michigan Health System study, the researchers found that only 22 percent of patients understood their diagnosis, the emergency care that was given, their post-ER care needs and what kinds of symptom would require immediate care.[157] Timely primary care follow up can mitigate understanding shortfalls and provide greater likelihood of a successful completion of a therapeutic plan.

In the current state, the Parkland system includes a 725-bed adult safety-net hospital that operates at or close to capacity throughout the year. It provides the largest emergency service in the region providing approximately 200,000 visits annually. With annual growth rates ranging from 6 to 13% over the last five years, the emergency service is operating at or above maximum capacity. Additionally, Parkland's community health clinic system also operates at functional capacity providing approximately 420,000 visits per year. In its current state, the referral flow between and among the inpatient, emergency and primary care system is at functional gridlock.

For patients being discharged in fiscal 2012, primary care referral orders were as follows: inpatient – 13,146 and emergency service – 27,072. While further study will be required to determine how many appointments were established and completed, it is well known within the Parkland system that is it very difficult to arrange for follow up primary care within the system. For the Parkland system, to have a primary care resource specifically positioned to provide post-acute primary care transitioning will be of invaluable importance to alleviating appointment gridlock and assuring timely follow up services to the patients who would have no other resource available.

[157] Annals of Emergency Medicine, doi: 10.1016/j.annemergmed.2008.05.016

How this project is a significant enhancement

This project provides a significant increase in primary care resources available to the Parkland system and the patients it serves. This project also serves as a lynch-pin to the success of three other Parkland projects. This project will provide dedicated post-acute primary care resources to alleviate demand pressure on the community health system enabling it to advance its aim to enhance the medical home model. And this project provides the resources that are necessary to support intensive care transitions investments and to leverage the investments being made in the care management arena. (These projects are outlined below.)

The project has no related activities funded by U.S. Department of Health & Human Services.

Project components

There are no required core components for Project Option 1.1.1

Milestones and Metrics

- P-X: Prepare a comprehensive plan for development of the Acute Response Clinic
    - P-X.1: Comprehensive business plan*. It will be important to study the size and the nature of the demand for services and determine which and how many geographic locations are best suited to match supply with the service demands. The model of primary care to be provided will need to be determined. Literature suggests that post hospital discharge follow up care may be best provided by the hospitalist service, but there is little evidence that this model has been used in conjunction with post emergency service care. Accordingly, it will be important to fully vet models of primary care that will yield the most productive result. The comprehensive business plan will detail the specific targets and measures that the project is intended to fulfill. This will provide the basis for performance improvement monitoring and course correcting activities. Upon completion and approval of the comprehensive business plan, facility lease space, an architect/space planner and contractor will be secured. While this project will require limited capital investment to build out the leased space, the capital investment is not contemplated to be a part of this project.*
- P-X: Determine the baseline metrics
    - P-X.1: *Define the target populations, and obtain historic metrics for primary care referrals, appointments established and completed appointments*
- P-5 Train/hire additional primary care provider and staff and/or increase the number of primary care clinics for existing providers

- P-5.1: Documentation of increase number of providers and staff and/or clinic sites. *While the facility space is being prepared for operation, Parkland will recruit and train the facility staff. During this time, the practice referral protocols and practice model will be refined. It is contemplated that by the middle to end of DY3, the new primary care clinic(s) will be readied to open.*

- P-1 Establish additional primary care clinics
    - P-1.1: Number of additional clinic(s) / scheduling slots. *Documentation will be provided of the number and location of Acute Response Clinic(s) added*

- I-12 Increase primary care clinic volume of visits and evidence of improved access for patients seeking services
    - P-12.1: Documentation of increased number of visits. *In DY4 the clinic(s) will be open and begin receiving referral appointments from the inpatient and emergency department care coordinators. This post-acute referral primary care clinic will begin to risk stratify and identify patients to the community clinics as appropriate for management in a medical home setting. During this year, performance relative to the visit volume targets and the percent of target population obtaining follow-up appointment access will be monitored. Progress barriers will be identified and addressed applying performance improvement methodologies.*

Unique community need identification numbers the project addresses

- *CN.4 - Primary Care and Pediatrics*. The RHP 9 Community Needs Assessment clearly identifies access to primary and preventive care as a significant need in Dallas, Denton and Kaufman counties. Expanding primary care access will also hopefully reduce unnecessary ED visits freeing capacity in the ED for more urgent needs.

- *CN.12 - Emergency Department Usage and Readmissions*. By supplying additional capacity targeted to post discharge inpatient and emergency follow up primary care, there should be an impact on reducing emergency department usage and readmissions.

Related Category 3 Outcome Measure(s)

OD-3: Potentially Preventable Re-Admissions – 30 day Readmission Rates

- IT-3.1: All cause 30 day readmission rate – NQF 1789 (Standalone Measure)

Reasons/rationale for selecting the outcome measures:

This project focus is on providing follow up after acute care (inpatient or emergency) to ensure proper treatment continuation of the initial condition; identifies misdiagnoses, treatment failures and complications; and supports patient compliance with the therapeutic plan. This intervention is intended to reduce readmission to the inpatient setting.

Category 4 Related Outcomes

- RD-2: Potentially Preventable Readmissions for All Cause
- RD-5: Emergency Department
- RD-6: Optional Domain: Initial Core Set of Health Care Quality Measures

Relationship to other Projects

Parkland will balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place.

This project will also produce the primary care resources that will be required to support Parkland project which is designed to provide the intensive intervention that has been demonstrated to improve primary care follow up compliance for uninsured emergency department patients.[158] Related projects include:

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method to project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.10 on a 9.0 scale. Influencing factors included:

- The large impact this project will have on the Grand Prairie low income population by introducing capacity growth of 40,000 visits over the five years of the project to this under-resourced community
- Alignment with the community need for primary care capacity expansion
- Cost avoidance by providing increased opportunity for patients in this community to obtain the right care in the right place at the right time

The following sketches the potential range of value that could be produced through the expansion of primary care as contemplated by this project. From this broad reasonableness review, this project value is demonstrated to fit below the comparative value range.

	DY2	DY3	DY4	DY5	Total
Potential Value of Avoiding Primary Care Clinic Crowd-Out					
Incremental cumulative visits that would have otherwise "crowded out" routine primary care clinic visit	0	0	20,000	40,000	
Ave. cumulative patients impacted	0	0	7,273	14,545	

Estimated per capita costs[159]	$8,952.8	$9,807.5	$10,327.3	$10,874.6	
Estimated target population cost	$0	$0	$ 75,110,453	$ 158,171,057	$ 233,281,510
Range of Potential Cost Reductions (20-33%)[160,161]					$ 46,656,302– $ 76,982,898
Project Valuation (Cat 1 + assoc Cat 3)					$ 36,939,956

Project Option 1.4.7 – Implement Health Literate Care Model and Enhance Interpretation Services and Culturally Competent Care

Unique Project ID: 127295703.1.7

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare, and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY 2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/Self-Pay/ Charity
Discharges - Adult - Neonatal	37,515 36,389 1,126	 17% 27%	 42% 39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits - Community Health Center - Women's Center - Subspecialty	1,031,311 446,646 239,825 344,840	n/a	n/a

Intervention.

Parkland will implement an evidence-based 'Health Literate Care Model' which incorporates health literacy strategies into the Care Model to better engage patients in their care. Several steps will be taken to implement this model:

1) Improvements and possible consolidation of appropriate interpretation services across the health system in order to better redistribute interpretation services to meet the needs of all the sites of care

The improvements will allow for the following elements to be addressed:[162]

- Care provided with a better understanding/respect for cultural values
- Recruitment, retention, and training of staff members who reflect and respond to the values and demographics of the communities served
- Consistent administrative, management, clinical and organizational processes and policies/procedures

2) Improved training/education requirements for all interpreters at Parkland regardless of assigned site of care

3) Health literacy guidelines and interventions provided by the Agency for Healthcare Research and Quality (AHRQ) Health Literacy Universal Precautions Toolkit will be implemented and incorporated into the Chronic Care Model through the Chronic Care Model and Chronic Care Registry projects. The tool addresses all elements of the Care Model including self-management delivery system design, decision support, clinical information systems and community partners.[163]

Need for the Project: As addressed in the Affordable Care Act, health literacy is the foundation to engaging patients in their health and improving health outcomes. Parkland's inpatient survey results for the HCAHPS questions related to explanations of care/treatment by nurses and physicians provided the following results (unadjusted results for the quarter of November 2012 through January 2013):

1) Nurses explain things in a way you can understand: 8.7% stated "never" or "sometimes" while 22.2% stated "usually" and 69.1% stated "always

2) Physicians explain things in a way you can understand: 5.9% stated "never" or "sometimes" while 17.6% stated "usually" and 76.5% stated "always"

From the results above, 30% of Parkland's patients do not "always" feel they understand the explanations of their caregivers and that means a significant number of patients may be missing very critical information regarding their health and recovery.

In addition, Parkland's patient population is very diverse with almost half who do not speak English or are very limited in their English proficiency. Parkland's patient population includes more than 53% Hispanic patients, of whom 39% state their primary language is Spanish. The Hispanic and other non-speaking English patient population at Parkland contribute to the need

[162] Health Resources and Services Administration. "Cultural Competence Works." US Department of Health and Human Services. 2000.

[163] Koh, Howard, et al. "A Proposed 'Health Literate Care Model' Would Constitute A Systems Approach to Improving Patient Engagement in Care." Health Affairs 32 (2). February 2013: 357-367

for 32,000+ encounters for interpretation services per month, topping out at almost 400,000 interpretation encounters per year at Parkland.

Target Population: Specific to this project, the target population includes all Parkland patients who require interpretation assistance/services. As stated above, of Parkland's Hispanic patient population (53% of total population), 39% state their primary language is Spanish and in one month, interpretation services at Parkland have more than 32,000 interpretation encounters including in-person encounters, language line calls and Texas Interpreting Service (ASL).

Category 1 & 2 Expected Patient Benefits: Expected benefits from implementing a Health Literate Care Model at Parkland include improved communication between the provider and patient such that the treatment plan is better understood, improving compliance and also improving outcomes for patients. Additionally, as this project will affect other projects through integration of the Health Literate Care Model into the Chronic Care Model, health literacy for those patients with chronic conditions will be improved, thus reducing waste through over utilized services (ED, etc.) throughout the health system and expanding capacity in the system for other patients.

Category 3 Outcomes/Goal. The following are identified for FY2016 outcomes:

- IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Establish that patients are receiving improved communication with their physicians (and nurses) based on related HCAHPS survey questions (Standalone Measure):
    - Nurses "always" explain in the way you can understand: 85%
    - Physicians "always" explain in the way you can understand: 90%

Project Description

Parkland will implement a Health Literate Care Model across the health system that will include expanding and enhancing interpretation services for the growing number of patients who require such services.

The Health Literate Care Model is defined by incorporating health literacy strategies and tools into the accepted Care Model (formally known as the Chronic Care Model).[164] The model is

[164] Koh, H., et al. "A Propose 'Health Literate Care Model' Would Constitute a Systems Approach to Improving Patients' Engagement in Care. Health Affairs 32 (2). February 2013.

based on "health literacy universal precautions", which is to say that providers approach every patient as if they are at risk of not understanding information relative to their care or treatment. Interventions of the Health Literate Care Model are identified in the 2010 Health Literacy Universal Precautions Toolkit, developed by the Agency for Healthcare Research and Quality (AHRQ).

Implementing the Health Literate Care Model will include the following steps:

1) Parkland will improve the current interpretation services program at Parkland. This may include consolidation of interpretation services staff across the system, recruitment of an appropriate number of interpreters (based on national benchmarks) and investment in new or improved technologies to meet current demand for interpretation services. Policies and procedures will be assessed to insure they meet national and state guidelines and current training/education will be assessed to insure a more robust and appropriately skilled labor force.

2) Training/education competencies will be defined across the health system and built into requirements for interpretation services.

3) Health literacy guidelines and interventions provided by the Agency for Healthcare Research and Quality (AHRQ) Health Literacy Universal Precautions Toolkit will be implemented and incorporated into the Chronic Care Model through the Chronic Care Model and Chronic Care Registry projects. The tool addresses all elements of the Care Model including self-management, delivery system design, decision support, clinical information systems and community partners.[165]

Goals and Relationship to Regional Goals

Parkland's main goal is to decrease health disparities and improve health literacy of all patients at Parkland, and especially those LEP patients whose primary language is not English in order to improve the patient's health status. This will be done through improving interpretation services and incorporating a Health Literate Care Model into the chronic care model and other program improvements for Care Transitions and Patient Navigation.

Regional goals include improved access to care, care coordination and management and provider performance and outcomes. Improving interpretation services will provide improved care management and will empower providers and patients to have better communications regarding treatment which will lead to improved patient outcomes.

Challenges

[165] Koh, Howard, et al. "A Proposed 'Health Literate Care Model' Would Constitute A Systems Approach to Improving Patient Engagement in Care." Health Affairs 32 (2). February 2013: 357-367

A major challenge will be addressing health literacy and implementing the Health Literate Care Model across such a large health system. This will require immediate improvements in interpretation services including possible and effective consolidation of all interpretation services and balancing the current staff with needs for the service. All interpreters are expected to have the appropriate level of skill/expertise – it will take time to determine who requires more education/training and recruit the necessary number of interpreters and educate them as well.

Another challenge is to insure all appropriate AHRQ guidelines are addressed such that the Health Literate Care Model is incorporated into the chronic care model and the chronic care patient registry. A plan will insure success and will include timelines and budget for function to be at highest level of efficiency and competence.

5-Year Expected Outcome for Provider and Patients

The 5-year expected outcome is to improve health literacy for Parkland patients whose primary language is not English (specifically whose primary language is Spanish), which will be determined through results of the patient survey around communication with their providers.

Starting Point/Baseline

In FY2012, Parkland Interpretation Services provided 380,000+ encounters including calls and in-person services, to patients throughout the Parkland health system. More than 120,000 Parkland patients (290,000 total patients annually) speak Spanish as their primary language. Of those, based on responses to the 2012 patient satisfaction surveys:

- 76.5% said their physician always explained things in a way they could understand
- 69.1% stated their nurse explained things in a way they could understand

Rationale

In the United States, the combined cost of health disparities and subsequent deaths due to inadequate and/or inequitable health care is $1.24 trillion and more than 30% of direct medical costs for Hispanics, Asian Americans and African Americans and are excess costs due to health inequities.[166] Deeper review established across the four major language groups, that 23% of those who spoke a language other than English at home were those aged 18 to 40 who spoke Spanish. According to the 2007 American Community Survey[167], 40-45% of the population in Texas speaks a language other than English at home and speaks English less than "very well." More specifically, 42% of Parkland patients have a primary language is other than English, of which 39% of the patients spoke Spanish. And studies have shown that health disparities for Spanish-speaking Latinos are far more likely than for Latino and non-Latino English-speakers.

[166] LaVeist, TA, PhD; Gaskin, DJ, PhD; Richard, P, PhD. "The Economic Burden of Health Inequalities in the United States." September 2009.
[167] U.S. Census Bureau. "Language Use in the United States." American Community Survey. 2007.

Literature documents that problems with health literacy are associated with poor outcomes and those with less than adequate health literacy have less knowledge about their medical conditions and treatment, worse health status and higher rates of hospitalization.[168] A 1995 study in a large public hospital indicated that 61% of Spanish-speaking patients had inadequate or marginal health literacy. Results showed 42% did not understand directions regarding their medications, 43% did not understand the Medicaid application, specifically regarding their rights and 60% did not understand informed consent.[169]

Providing appropriate interpretation services has shown to improve health outcomes through improved communication with providers. Patients who have interpretation services available are more likely to ask questions about their care and better understand their role in their treatment plan. Additionally, those patients are more satisfied with their health care experience. One study showed that patients who rated their interpreter as "excellent" or "very good" also rated the health care they received highly.[170] Moreover, health care literature indicates that patients prefer and satisfaction gains are more evident when a professional in-person interpreter is used to communicate with patients, rather than lay staff and/or family, or telephone "language lines."[171] Parkland's interpretation services can better meet the needs of the patients through a more consistent and comprehensive program that insures clinicians and interpreters are appropriately trained to communicate with patients who require such services.

Project Components

There are no components for 1.4.7 – Other Project: Implement Health Care Literate Model. However, there are components that will be addressed for Project Option 1.4.1 including the following:

a) Identify and address language access needs and/or gaps in language access. *A plan for improved interpretation services will be developed. This plan will include the gap analysis for current needs and an implementation plan with timelines and accountabilities*. *Additionally, health literacy will be a major element in implementing the chronic care model at Parkland and in establishing appropriate transitions of care for LEP patients.*

b) Implement language access policies and procedures (in coordination with statewide and federal policies to ensure consistency across the state). *A review of regulatory requirements and current policies/procedures will be done and will direct modifications*

June 2004; vol. 20 no 6; p. 373-378.

to current policies and procedures as well as development of new policies/procedures as appropriate.

c) Increase training to patients and providers at all levels of the organization (and organization-wide) related to language access and/or cultural competency/sensitivity. *A review of the current competencies and needed competencies will be done. As a result of that review, Necessary training/education will be defined and new as well as current staff will be trained to meet required competencies*.

d) Increase interpretation services. *Necessary services will be identified through the gap analysis and will be addressed in the implementation plan.*

Milestones and Metrics

- P-4: Expand qualified health care interpretation technology
    - P-4.1: Video or audio conferencing interpreter terminals and/or areas/units of Performing Provider with access to health care interpretation technology
- P-7: Train a number or proportion of providers (and other staff) to appropriately utilize health care interpreters (via video, phone or in-person)
    - P-7.1: Expand language access utilization
    - P-7.2: Increase number of staff using available, qualified health care interpreters
- P-X: Utilize the Health Literacy Universal Precautions Toolkit to improve communications with patients as well as improve self-management and supportive systems for patients
    - P-X.1: Education/training for all interpreters and clinicians
    - P-X.2: Effective use of educational materials for patients
- I-13: Improve language access
    - I-13.1: Number of qualified health care interpreter encounters per month, based on one of the reporting months within the prior year
- P-11: Review project data and respond to it with tests of new ideas, practices, tools, etc.
    - P-11.1: Number of new ideas, practices, tools, solutions tested

- I-17: Milestone: Reduce wait time for interpretation encounters
    - I-17.1: The percentage of encounters in which the patient wait time for an interpreter is 15 minutes or less, as specified in *Speaking Together, National Quality Forum or similar* measures, or Average wait time for interpretation encounter, as measured by *Straight Talk: Model Hospital Policies & Procedures on Language Access, National Quality Forum or similar.*
- I-18: Milestone: Implement intervention to increase access to language services and culturally competent care
    - I-18.1: Increase percentage of target population reached

Unique Community Need Identification Numbers the Project Addresses

- *CN.1 Demographics*. Approximately 44% of Dallas Fort Worth residents are New Americans – defined as either foreign born or the children of foreign born and English is not the language spoken at home in 39% of North Texas homes.
- *CN.11 Patient Safety and Quality*. Research on health disparities and quality of care proves a correlation between those with health disparities and the care they receive.

How the Project significantly enhances an existing delivery system reform initiative

Parkland intends to improve the effectiveness of current interpretation services through development of a plan that will assess current/future need and current capabilities as well as determine implementation steps, timelines and accountabilities to improve those services.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-6: Percent improvement over baseline of patient satisfaction scores (2) to determine how well their doctors and nurses communicated (Stand-alone Measure)

- IT-6.1: Percent improvement over baseline of patient satisfaction for patients whose primary language is Spanish specific to the following questions on the survey:
    - "Nurse explained in a way I could understand"
    - "Physician explained in a way I could understand"

Reasons/Rationale for selecting outcome measures

People go to the doctor to be treated for an acute or chronic illness. If the provider does not communicate in way the patient can understand, the patient can leave disheartened, confused, and unsure regarding treatment instructions, medication regiments, etc. Parkland has a large number of patients who have a non-English primary language and while many of Parkland's providers are bi- or multi-lingual, there are still opportunities for miscommunication. Measuring patient's satisfaction regarding specific questions related to that communication will provide the basis to insure we are meeting their needs.

Relationship to Other Projects

This project covers care across the continuum and for all patients who require interpretation services but there are no similar proposed projects.

Category 4 Related Outcomes

- RD-4: Patient-centered Healthcare: Patient Satisfaction

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

There are no other RHP9 performing providers who have similar projects due to the specific needs of the Parkland patient population.

As appropriate, we plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 7.45 on a 9.00 scale. Influencing factors included:

- The large impact this project will have on improved communication with patients regarding their treatment (which will lead to improved outcomes)
- Alignment with the needs of the Dallas County population, of which many have a non-English primary language and require interpretation services

As much as 30.6% of direct medical care expenditures for African Americans, Asians and Hispanics were excess costs due to health inequalities to which language barriers are a major contributor.[172] The above analysis is applied in the following table to describe the potential excess costs that could be mitigated through this intervention.

Parkland Annual Direct Medical Costs (2013)	LEP Percent of Patient Population	Excess Cost Factor	Potential Excess Costs
$1,069,283,113	40%	30.6%	$130,880,253 (annual)
		Potential excess costs over 4 years	$523,521,012
		Category 2 and associated Category 3 Total Project Value	$33,561,302 (over 4 years)
		Percent Project Value to Potential Excess Costs	6.4%

Project Title: 1.8.1 - Expansion of Senior Dental Student Externship Program

RHP Project Identifier: 009784201.1.1

Performing Provider: Baylor College of Dentistry / 009784201

Project Description:

This project addresses **RHP Planning Protocol section 1.8: Increase, Expand and Enhance Oral Health Services**, **project option 1.8.1**: *Development of academic linkages with the three Texas dental schools, to establish a multi-week externship program for fourth year dental students to provide exposure and experience in providing dental services within a rural setting during their professional academic preparation.*

Summary

- Texas A&M Health Science Center / Baylor College of Dentistry (BCD) is the largest single provider of oral health care services in the Dallas/Fort Worth metropolitan area and dedicated to combining higher education and research with community service. Almost two-thirds of the dentists in the Dallas/Fort Worth area received their education at BCD, and more than one-third of all dentists in Texas are graduates of the college. The college completes more than 103,500 patient care visits annually, 45% of which benefit low-income individuals, and donates $3.3 million in services to the community. BCD students and faculty working in sponsored outreach programs outside the college provided an additional $1,400,000 in donated dental services for approximately 37,000 patients in the Dallas area.

- BCD proposes to increase the number of dental trainees with externship experience in rural and underserved areas of Texas, increase the total amount of externship experience each individual student receives, and increase the percentage of new dental graduates entering practice in rural and/or underserved areas.

- The target population for this project will be the patient population at the FQHCs, IHS and other community clinics providing dental care to the underserved throughout the state where BCD has internship agreements. The vast majority will be Medicaid patients, Medicaid-eligible and/or poor or indigent. A secondary target population will be the BCD students themselves, who will receive community-based clinical training at the internship sites.

- Category 1 or 2 outcome: Approximately 8,000 additional unduplicated patients over four years. Approximately 200 additional students participating in the internship program.

Improvement Milestone I-11.1: Increase dental care training

Metric 1: I-11.1 Increase the number of fourth year dental students that have participated in externships that provide experience in a rural setting

Customizable Improvement Milestone I-15: Increase the number of patients treated by fourth year dental students during externships

I-15.1. Metric: Number of patients treated by fourth year dental students during externship training opportunities

a. Numerator: Total number of patients treated by fourth year dental students during externship opportunities (with appropriate faculty oversight)

b. Denominator: Total number of patients treated during externship opportunities (by site staff only)

c. Data Source: Billing and treatment records

d. Rationale/Evidence: The externship training opportunities should expand the capacity of the site to provide dental services.

- Customizable Category 3 Outcome: Increasing the percentage of BCD graduates entering practice in rural or underserved areas to 10%.

Lack of dentists in some Texas counties, particularly in the rural areas, is a barrier for many children and adults. From 1991 to 2000, the number of dentists grew by 8.3 percent, while the population grew by 20 percent. The result was a 7.4 percent decrease in the number of dentists per 100,000 people. As of October 2012, there were approximately 13, 400 active dentists in Texas, yielding a ratio of dentists per 100,000 of 52.2. Unfortunately, the geographical distribution of dental practices across the state is distinctly uneven. The vast majority of dentists practice in and around the four major metropolitan areas of the state – Austin, Dallas-Ft. Worth, Houston and San Antonio.

The number of health-care providers available to service an area impacts the quality and quantity of health care received. The number of dentists is the primary indicator used to determine if an area is a Dental Health Professional Shortage Area (DHPSA). Currently more than 34 state public health programs use the Health Professional Shortage Area (HPSA) designation to determine eligibility for funding. Across Texas, more than 80 entire counties have been designated as DHPSAs, and 27 counties have been designated as partial DHPSAs. Areas with a ratio of less than one dentist for every 3,000 residents meet the "dentist to population ratio" requirement as specified in the federal designation eligibility criteria for a DHPSA. Other eligibility criteria used to establish a DHPSA include the area's poverty and fluoridation rates. These eligibility criteria are used to determine if an area has insufficient capacity to meet existing needs. An area's insufficient capacity is indicated by the time needed in advance of an appointment, number of patient visits during a full-time work week, and the number of providers not accepting new patients. According to the National Health Service Corps, Texas would need in excess of 700 additional dentists to achieve the recommended ratio of one dentist for every 3,000 residents. Moreover, the dentist-patient ratio seen among rural dentists is lower than among urban dentists. Low-income populations in rural areas thus are

potentially less likely to have access to dental care than low-income populations in urban areas. There are three schools of dentistry in Texas: Baylor College of Dentistry; University of Texas Health Science Center at Houston Dental Branch; and University of Texas Health Science Center at San Antonio Dental School. It is worth noting that all are located in a major metropolitan area.

BCD proposes to expand the existing externship program incrementally, by identifying new sites for externship programs, increasing the average length of the externships and recruiting a larger percentage of the senior dental class to participate in the program. Currently, about 40% (42 students) of the senior class participates annually, and there are 20 different opportunities to participate. The primary limiting factors for the program are funding and the relatively limited opportunity to participate, due to other training obligations. Currently this program is funded entirely by the Baylor Oral Health Foundation (the endowment fund of the dental school) and local funds available to the BCD department of Public Health Sciences, which oversees the program. There is no federal funding currently available to BCD to support this program. BCD has instituted changes in the clinical training program to include more off-campus training, as well as efforts to identify additional new sites/opportunities for participation.

By providing more training opportunities for dental students, the project has the potential to enhance recruitment and retention efforts of current and future dental providers in the rural and underserved areas of the state. Increased familiarity with the areas, personal experience with the overwhelming need for services in some areas and populations, increased familiarity with practice settings and opportunities and the potential for loan repayment should serve to influence students' decisions on where and how to enter practice.

Goals and Relationship to Regional Goals

Project Goals:

- Increasing the number of opportunities for multi-week externship opportunities in rural and/or underserved areas available to senior dental students at Baylor College of Dentistry / Texas A&M Health Science Center
- Increasing the number of students that participate in the externship program
- Increasing the percentage of new dental graduates entering practice in rural and/or underserved areas

Related regional goals:

- Increasing health care capacity and addressing healthcare access
- Reducing the prevalence of chronic diseases presenting early in life, that become more prevalent and exhibit more severe complications

- Reducing the high volume of patients with preventable conditions seeking care in emergency departments

Challenges

There are three major challenges that must be addressed in order to maximize the success of the project: 1) the highly structured dental curriculum that can limit students' participation in externship programs, 2) a somewhat limited number of sites available statewide for clinical training in the state, and 3) limited funding for the program.
With regard to the first issue, BCD has recognized the value of community-based clinical training and over the past five years embarked on a program to develop clinical externship programs in rural and underserved areas of the state. Curriculum changes have been initiated that allow students, particularly in the senior year, to participate more frequently and for longer periods than ever before. In concert with the curriculum changes, the College has negotiated with a number of federal, state, non-profit, church and community-based dental providers. As a result, a network of externship sites has been developed to service the student population. The challenge to the proposed project on this front is to expand the number of available sites, in order to accommodate the increased number of students participating in externship programs, and the increased average length of the externships. We are also proposing, as part of this project, to increase the funding for the externship program.

5 – Year Expected Outcome
BCD expects to 1) have establish 60 externship opportunities, 2) see class participation in externship programs rise to 90% by DY5, with the potential of as many as 100-200 new dental graduates over four years that have participated in the program, and 3) increase the percentage of new graduates entering practice in a rural and/or underserved area to 10%. The total number of patient encounters by the students over four year will be approximately 9,000, on approximately 8,000 unduplicated patients. We also anticipate that the percentage of new graduates entering practice in rural and/or underserved areas to rise to approximately 10%.

Interrelated Projects (Regional Goals)
N/A

Starting Point/Baseline
At the present time, senior class participation in Baylor's clinical training externship program is approximately 40% annually (42 students). We are able to offer 20 different opportunities for participation (some accommodating multiple students). The percentage of graduates who begin practice in a rural and/or underserved area currently averages approximately 5%.

Rationale

Unique community need identification numbers the project addresses

- CN.3 Healthcare Capacity
- CN.10 Dental Health
- CN.12 Emergency Department Usage and Readmissions

As documented in the RHP 9 Community Needs Assessment section CN.10 Dental Health, the disease burden of dental decay is high is many sectors of the populations, particularly minorities and low-socioeconomic groups. Dental decay is the most prevalent chronic disease in man, five times more common than asthma in children. Oral health problems are a major cause of school absences among elementary school children, and the seventh leading cause of workdays lost nationally. With regard to CN.3 Healthcare Capacity, this burden is exacerbated by dental manpower shortages in many areas of the state. Increased externship experience in rural/underserved areas will facilitate care of these populations, increase trainees' experience and familiarity with these populations and presumably increase recruitment and/or retention in these areas. Finally, the combination of disease prevalence, strategic manpower shortages and difficulties in general with access to dental care, a growing number of patients seek treatment for dental problems in the emergency departments of hospitals, most of which are not equipped to manage the problems. This adds to the expense of treatment and compounds the problems of already over-burdened emergency departments. Efforts to increase dental manpower, particularly in rural and underserved areas will serve to prevent emergency department visits for dental problems, addressing CN.12 Emergency Department Usage and Readmissions.

Related Category 3 Outcome Measure(s)

OD-7 Dental Health

- 3.IT-7.10 Percentage of new dental graduates entering practice in rural and/or underserved areas

As mentioned above, the disease burden of dental decay is high is many sectors of the populations, particularly minorities and low-socioeconomic groups. This burden is exacerbated by dental manpower shortages in many areas of the state. Increased externship experience in rural/underserved areas will facilitate care of these populations, increase trainees' experience and familiarity with these populations and presumably increase recruitment and/or retention in these areas. The combination of disease prevalence, strategic manpower shortages and difficulties in general with access to dental care, a growing number of patients seek treatment for dental problems in the emergency departments of hospitals, most of which are not equipped to manage the problems. This adds to the expense of treatment and compounds the problems of already over-burdened emergency departments.

This project will provide more training opportunities for dental students, with the potential to enhance recruitment and retention efforts of current and future dental providers in the rural and underserved areas of the state. Increased familiarity with the areas, personal experience with the overwhelming need for services in some areas and populations and increased familiarity with practice settings and opportunities and the potential for loan repayment should serve to influence students' decisions on where and how to enter practice. Therefore, the number of senior dental students electing to participate in one or more externships each year is proposed as an appropriate outcome measure for this project.

Relationship to Other Projects in RHP Plan

This project is part of an overall effort to increase the amount of community-based clinical training for our dental students, while serving the needs of our community. BCD has proposed three projects for the RHP plan. The other two projects involved expanded hours for community dental clinics utilizing BCD student clinicians, and expanding BCD's existing school-based dental sealant program.

Relationship to Other Performing Providers' Projects in RHP

Because we are the only dental performing provider, there is little relationship between this project and other providers' projects.

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation of this project is based primarily on the value of the care provided by the students during their externship trainings. The population addressed will be patients in rural/underserved areas who will be treated by the trainees, and will number approximately 8,000 over the four years of the project. Estimating the number students participating annually, and their production capacity, we conservative estimate an annual total of 2,250 patient encounters. Based on data from non-profit providers in the Dallas area and some of the current externship sites, the average cost of each encounter is approximately $125. A multiplier of 2.7, based on data from The Original National Dental Advisory Service 2012 (Yale Wasserman, D.M.D. Medical Publishers, Ltd. NDAS 30th Edition), will be applied to the average encounter cost. Calculation of this multiplier is based on Medicaid dental reimbursements by procedure

code versus the NDAS Comprehensive Fee Report, which is a nationwide marketplace analysis of usual and customary fees. The multiplier is also a way to incorporate the benefit to the community, in terms of addressing a high-priority community need, the size of the population served and the cost avoidance, e.g. reduced school absences, improved academic performance in children and decreased workdays lost due to dental complaints. Taken together, these figures estimate a total of $759,375 in treatment rendered during each year of the project.

Project Title: 1.8.6 - Expansion of Dallas County dental clinic hours
RHP Project Identifier: 009784201.1.2
Performing Provider: Baylor College of Dentistry / 009784201

Project Description:

This project addresses **RHP Planning Protocol section 1.8: Increase, Expand and Enhance Oral Health Services**, **project option 1.8.6:** *The expansion of existing dental clinics, the establishment of additional dental clinics, or the expansion of dental clinic hours.*

Summary

- Texas A&M Health Science Center / Baylor College of Dentistry (BCD) is the largest single provider of oral health care services in the Dallas/Fort Worth metropolitan area and dedicated to combining higher education and research with community service. Almost two-thirds of the dentists in the Dallas/Fort Worth area received their education at BCD, and more than one-third of all dentists in Texas are graduates of the college. The college completes more than 103,500 patient care visits annually, 45% of which benefit low-income individuals, and donates $3.3 million in services to the community. BCD students and faculty working in sponsored outreach programs outside the college provided an additional $1,400,000 in donated dental services for approximately 37,000 patients in the Dallas area.

- BCD proposes to increase the hours of operation at three community dental clinics in the Dallas area by placing senior dental students in community-based clinical training programs at the clinics.

- The target population for this project will be the patient population at the community clinics. The vast majority are Medicaid patients, Medicaid-eligible and/or poor or indigent. Approximately 80% of the patient population are pediatric patients. A secondary target population will be the BCD students themselves, who will receive community-based clinical training at the clinic.

- Category 1 or 2 outcome: Approximately 35,000 patient encounters over four years. Approximately 200 additional number of students participating in the internship program

- Category 3 Outcomes: Increase the percentage of children age 6-9 with a dental sealant on a permanent first molar tooth as follows; DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%.

  Increase the percentage of children age 0-6 who received a fluoride varnish application during the measurement period as follows; DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%. Percentage of children, age 0-20 years who received a fluoride varnish application during the measurement period as follows: DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%.

- Project metrics will be assessed by collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators relating to project outcome milestones will be captured directly onsite at Dallas elementary school campuses for children enrolled in Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC's S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants, fluoride varnish applications and early childhood caries.

BCD proposes to expand the hours of operation in four clinics in the metropolitan area of Dallas, utilizing senior dental students in clinical externships.

Over the past two years, Baylor College of Dentistry has begun an initiative to increase the community-based clinical training program component of the clinic curriculum. The College has a long-standing collaboration with Community Dental Care, a non-profit dental provider operating 12 clinics in the Dallas area. In all, the program involves senior dental students rotating through four clinics; 1) Community Dental Care's Vickery Meadow dental center, 2) Community Dental Care's Grand Prairie dental center, 3) Community Dental Care's Bluitt-Flowers dental center, and 4) the dental clinic operated by Baylor College of Dentistry in the Dallas County Juvenile Detention Center.

Vickery Meadow dental center is currently open Monday-Friday, 8am-4:30pm. We propose to open the clinic 8am-4:30pm on Saturdays, with patients being seen by senior dental students under the supervision of BCD faculty. We conservatively estimate a total of 330 patient encounters annually, for a four-year total of 1,320.

Grand Prairie dental center will open in April of 2013, Monday-Friday, 8am-4:30pm, with one staff dentist. BCD dental students will rotate through the clinic one day per week year-round. We estimate the staff dentist will generate 3,000-4,500 patient encounters annually, with approximately 700 patient encounters by the dental students, for an annual total of 3,700 encounters. These rates will result in a total of between 15,000 and 16,000 patient encounters over the four-year course of the project.

Bluitt-Flowers dental center will expand hours in July 2013, Monday-Friday 8am-4:30pm, adding ten BCD dental students working in pairs. The students will generate approximately 1,200 patient encounters in DY2 and 5,700 annually thereafter, yielding a four-year total of approximately 18,000 encounters.

The Juvenile Detention Center clinic is currently operated four days per week, 10am-4:30pm, staffed by senior dental students working under the supervision of BCD faculty. We propose to

open the clinic an additional day per week, with a resultant increase of 312 patient encounters annually, for a four-year total of approximately 1,250 additional visits.

Clinic	Annual	Add'l patient encounters over 4 years
Vickery Meadow	330	1,320
Grand Prairie	3,700	15,000
Bluitt-Flowers	5,700	18,000
Juvenile Detention Center	312	1,250
Total	10,042	35,570

Expanding the hours of these clinics as described above will result in approximately 35,500 encounters more than currently provided.

Goals and Relationship to Regional Goals

Project Goal:

- Increasing access to dental care by extending the hours of operation of four dental clinics in the Dallas metropolitan area.

Related regional goals:

- Reducing the prevalence of chronic diseases presenting early in life, that become more prevalent and exhibit more severe complications
- Reducing the high volume of patients with preventable conditions seeking care in emergency departments

Challenges

The major challenges to the success of the project are the highly structured dental curriculum and crowded training program at the dental school, which limit students' participation in extramural training. BCD has recognized the value of community-based clinical training and over the past five years embarked on a program to develop clinical externship programs in rural and underserved areas of the state. Curriculum changes have been initiated that allow students, particularly in the senior year, to participate more frequently and for longer periods than ever before. In concert with the curriculum changes, the College has expanded its long-standing collaboration with Community Dental Care, a local non-profit dental provider with 12 clinics in the Dallas area. BCD proposes to expand its community-based clinical training program in order to provide student clinicians to staff the extended hours at Community Dental Care clinics and the Juvenile Detention Center clinic.

5 – Year Expected Outcome

Expanding the hours of these clinics as described above will result in approximately 35,500 encounters more than currently provided. All of these clinics serve primarily low socioeconomic status, underserved populations. A large majority (80%) of the patient population seen in the clinics are children age 5-20.

Interrelated Projects (Regional Goals)

N/A

Starting Point/Baseline

The current number of annual patient encounters at the Vickery Meadow clinic is approximately 4,000, for the Bluitt-Flowers clinic approximately 3000, and approximately 2,000 at the Juvenile Detention Center clinic. The Grand Prairie dental center is not yet open, so the baseline is effectively zero for that clinic.

Rationale

Unique community need identification numbers the project addresses

- CN.10 Dental Health
- CN.12 Emergency Department Usage and Readmissions

As documented in the RHP 9 Community Needs Assessment section CN.10 Dental Health, the disease burden of dental decay is high is many sectors of the populations, particularly minorities and low-socioeconomic groups. Dental decay is the most prevalent chronic disease in man, five times more common than asthma in children. Oral health problems are a major cause of school absences among elementary school children, and the seventh leading cause of workdays lost nationally. Finally, the combination of disease prevalence, strategic manpower shortages and difficulties in general with access to dental care, a growing number of patients seek treatment for dental problems in the emergency departments of hospitals, most of which are not equipped to manage the problems. This adds to the expense of treatment and compounds the problems of already over-burdened emergency departments. Efforts to increase dental manpower and improve access, particularly in rural and underserved areas will serve to prevent emergency department visits for dental problems, addressing CN.12 Emergency Department Usage and Readmissions.

Related Category 3 Outcome Measure(s)

OD-7 Dental Health

- IT-7.1 Dental Sealant: Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth
- IT-7.3 Early Childhood Caries (fluoride applications): Percentage of children age 0-6 who received a fluoride varnish application during the measurement period
- IT-7.4 -Topical Fluoride application: Percentage of children, age 0-20 years who received a fluoride varnish application during the measurement period

As mentioned above, the disease burden of dental decay is high is many sectors of the populations, particularly minorities and low-socioeconomic groups. This burden is exacerbated by dental manpower shortages in many areas of the state. The combination of disease prevalence, strategic manpower shortages and difficulties in general with access to dental care, a growing number of patients seek treatment for dental problems in the emergency departments of hospitals, most of which are not equipped to manage the problems. This adds to the expense of treatment and compounds the problems of already over-burdened emergency departments. A large majority (80%) of the patient population seen in the clinics targeted in the project are age 5-20, thus outcome measures related to sealants, early childhood caries and topical fluoride application are appropriate.

Project metrics will be assessed by collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators relating to project outcome milestones will be captured directly onsite at Dallas elementary school campuses for children enrolled in Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC's S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants, fluoride varnish applications and early childhood caries.

Relationship to Other Projects in RHP Plan

This project is part of an overall effort to increase the amount of community-based clinical training for our dental students, while serving the needs of our community. BCD has proposed three projects for the RHP plan. The other two involve increasing the number of dental students participating in internships in rural and/or underserved areas of the state, and expanding BCD's existing school-based dental sealant program.

Relationship to Other Performing Providers' Projects in RHP

Because we are the only dental performing provider, there is little relationship between this project and other providers' projects.

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation of this project is based primarily on the value of the care provided by the students during their rotations. The population seen in the clinics is overwhelmingly disadvantaged, underserved and of low-socioeconomic status, and will number approximately 10,000 over the four years of the project. Estimating the number students participating annually and their production capacity, we estimate an annual total of 3,300 patient encounters in DY2 and approximately 10,500 each year thereafter. Based on data from non-profit providers in the Dallas area and some of the current externship sites, the average cost of each encounter is approximately $125. A multiplier of 2.7, based on data from The Original National Dental Advisory Service 2012 (Yale Wasserman, D.M.D. Medical Publishers, Ltd. NDAS 30th Edition), will be applied to the average encounter cost. Calculation of this multiplier is based on Medicaid dental reimbursements by procedure code versus the NDAS Comprehensive Fee Report, which is a nationwide marketplace analysis of usual and customary fees. The multiplier is also a way to incorporate the benefit to the community, in terms of addressing a high-priority need, reducing school absences, improving academic performance in children and decreasing workdays lost due to dental complaints, the size of the population served and cost avoidance, as well as the benefit of additional clinical training for the dental students. Altogether, these figures estimate a total of over $1M in treatment during the first year of the project, and in excess of $3.6M each year thereafter.

Project Title: 1.8.9 - Expansion of school-based dental sealant program
RHP Project Identifier: 009784201.1.3
Performing Provider: Baylor College of Dentistry / 009784201

Project Description:

This project addresses RHP Planning Protocol section **1.8: Increase, Expand and Enhance Oral Health Services, project option 1.8.9:** *The implementation or expansion of school-based sealant and/or fluoride varnish programs that provide sealant placement and/or fluoride varnish applications to otherwise unserved school-aged children by enhancing dental workforce capacity through collaborations and partnerships with dental and dental hygiene schools, local health departments (LHDs), federally qualified health centers (FQHCs), and/or local dental providers.*

Summary

- Texas A&M Health Science Center / Baylor College of Dentistry (BCD) is the largest single provider of oral health care services in the Dallas/Fort Worth metropolitan area and dedicated to combining higher education and research with community service. Almost two-thirds of the dentists in the Dallas/Fort Worth area received their education at BCD, and more than one-third of all dentists in Texas are graduates of the college. The college completes more than 103,500 patient care visits annually, 45% of which benefit low-income individuals, and donates $3.3 million in services to the community. BCD students and faculty working in sponsored outreach programs outside the college provided an additional $1,400,000 in donated dental services for approximately 37,000 patients in the Dallas area.

- BCD proposes to expand its school-based sealant and fluoride varnish program operating in the Dallas Independent School District and other suburban school districts.

- The target population for this project will be elementary school students (2nd and 3rd graders) in the Dallas Independent School District and various suburban school districts. More than 80% of DISD children are considered economically disadvantaged, far higher than the state figure of 59%. School campuses with an enrollment of at least 70% economically disadvantaged children will be eligible for participation. According to Basic Screening Survey data collected by the Texas Department of State Health Services in 2008, the last year for which data is available, 34% percent of Texas third-grade children had a sealant on at least one permanent molar tooth. In Dallas County, the figure was 28%. Children enrolled in Texas Medicaid and CHIP as well as those who are not eligible for public insurance will be served through the project. A secondary target population will be the BCD students themselves, who will receive community-based clinical training at the internship sites.

- Category 1 or 2 outcome: Project goals include incremental increases in DY3, DY4 and DY5, as measured by the number of unduplicated patients seen by the sealant program, and the number of elementary schools added to the program. Approximately 5,800 additional children will be screened and receive fluoride varnish applications, and more than 17,000 sealants will be placed over four years. The sealant program will be expanded from 45 to 60 or more elementary schools, and approximately 200 additional dental students will participate in the program.

- Category 3 Outcomes:

    - Increase the percentage of children age 6-9 with a dental sealant on a permanent first molar tooth: DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%.

    - Increase the percentage of children age 0-6 who received a fluoride varnish application during the measurement period: DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%.

    - Increase the percentage of children, age 0-20, who received a fluoride varnish application during the measurement period: DY2: 28%, DY3: 29%, DY4: 31% and DY5: 32%.

- Project metrics will be assessed by collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators relating to project outcome milestones will be captured directly onsite at Dallas elementary school campuses for children enrolled in Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC's S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants, fluoride varnish applications and early childhood caries.

BCD proposes to expand its school-based sealant and fluoride varnish program operating in the Dallas Independent School District and other suburban school districts. Currently, the sealant program operates four days per week, with a staff of four dental students and a faculty supervisor. Over the past ten years, the program has visited approximately 45 schools each year, providing sealants and fluoride varnish applications for an average of 2,000 children annually. In DY2, operation of the program will expand to five days per week, with a target of 50 schools and 700 additional children treated. In DY3, we propose to purchase an additional vehicle and equipment, operating two sealant program teams five days per week. The number

of additional children seen annually in years DY2-DY5 will be approximately 1,800, for a total of 5,850 additional children screened and receiving fluoride varnish applications and more than 17,000 sealants placed over four years.

Goals and Relationship to Regional Goals

Project Goals:

- Increasing the number of elementary schools participating in the sealant program
- Increasing the number of patients seen in the sealant program

Related regional goals:

- Increasing health care capacity and addressing healthcare access.
- Reducing the prevalence of chronic diseases presenting early in life, that become more prevalent and exhibit more severe complications
- Reducing the high volume of patients with preventable conditions seeking care in emergency departments

Challenges

The challenges that must be addressed in order to maximize the success of the project are: 1) the highly structured dental curriculum that can limit students' participation in community-based clinical training programs, 2) the additional equipment required to expand the scope of the program, and 3) increased recruitment of students. With regard to the first issue, BCD has recognized the value of community-based clinical training and over the past five years embarked on a program to develop clinical externship programs in rural and underserved areas of the state. Curriculum changes have been initiated that allow students, particularly in the senior year, to participate more frequently and for longer periods than ever before. BCD proposes to purchase additional equipment in DY3, and to operate two sealant teams simultaneously. Finally, we have begun a program of education and training for Dallas Independent School District nurses, explaining the program and emphasizing the importance of oral health, the benefits of sealants, and encouraging the nurses to aid us in recruiting children for the program.

5 – Year Expected Outcome

BCD expects to deploy two sealant program teams, each operating five days a week, visiting approximately 60 elementary schools each year. The total number of patient receiving

screenings, fluoride varnish sealants over four years will be approximately 5,800, and more than 17,000 sealants.

Project metrics will be assessed by collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators will be captured directly on site at Dallas elementary school campuses for children enrolled in Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC's S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants, fluoride varnish and early childhood caries.

Interrelated Projects (Regional Goals)

N/A

Starting Point/Baseline

At the present time, the sealant program visits approximately 45 schools each year, treating an average of 2,000 children annually.

Rationale

Unique community need identification numbers the project addresses

- CN.10 Dental Health
- As documented in the RHP 9 Community Needs Assessment section CN.10 Dental Health, the disease burden of dental decay is high is many sectors of the populations, particularly minorities and low-socioeconomic groups. Tooth decay (dental caries) is the most common chronic childhood disease. Dental caries can have serious consequences, including the loss of tooth structure, inadequate tooth function, unsightly appearance, pain, infection, and tooth loss. If left untreated, the pain and infection of tooth decay can lead to problems in eating, speaking, and learning. Annually, an estimated 51 million school hours across the nation are lost because of dental-related illness (U.S. DHHS 2000a). Tooth decay is five times more common than asthma and seven times more common than hay fever (U.S. DHHS 2003). The prevalence of tooth decay is not uniformly distributed in Texas. Some groups of children, such as those from low-income or minority families, are more likely to experience the condition. Past research consistently shows an inverse relationship between parents' socioeconomic status and children's tooth decay. Children from low-income and minority families often have poorer oral health outcomes, fewer dental visits, and fewer protective sealants. The prevalence of the caries experience, including untreated decay, is higher among six-to-

eight-year-old children in Texas compared to six-to-eight-year-old children in the United States. For dental care by racial/ethnic category, Texas is lower than national averages among white and Hispanic children and adolescents. National averages for preventive dental visits among children and adolescents are higher for both boys and girls as compared to boys and girls in Texas. School-based dental sealant programs have been identified by the CDC as a preventive measure that has strong evidence demonstrating effectiveness in the prevention of dental caries and allow for low-income high risk children to receive dental sealants that otherwise may not have the opportunity to receive them. Measuring increases in special high risk populations accessing dental services reflects the goals of addressing health disparities in access to dental care.

Related Category 3 Outcome Measure(s)

OD-7 Dental Health

- IT-7.1 Dental Sealant: Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth
- IT-7.3 Early Childhood Caries (fluoride applications): Percentage of children age 0-6 who received a fluoride varnish application during the measurement period
- IT-7.4 -Topical Fluoride application: Percentage of children, age 0-20 years who received a fluoride varnish application during the measurement period

Community water fluoridation is by far the most cost-effective means of preventing dental decay. Since the public water supply in Dallas is fluoridated, the next most cost-effective measures are sealants and topical fluoride. In children for whom access to care is problematic, sealants and fluoride varnish are the most practical and cost-effective preventive treatments, particularly when delivered in school-based programs. The patient population targeted by the sealant program is children age 6-9, thus outcome measures related to sealants and topical fluoride application are appropriate.

Project metrics will be assessed by collection of oral health surveillance data using the appropriate module of the Basic Screening Survey. Key oral health status indicators relating to project outcome milestones will be captured directly onsite at elementary school campuses for children enrolled in Kindergarten, second and third grade. Direct data entry will be performed in the school-based sealant program using the SmilesMaker software, a modified version of the CDC's S.E.A.L.S. data collection tool. In both modules of the Basic Screening Survey, the assessment includes age-appropriate oral measures of oral health status including: untreated decay, urgency of care, caries experience, dental sealants, fluoride varnish applications and early childhood caries.

Relationship to Other Projects in RHP Plan

This project is part of an overall effort to increase the amount of community-based clinical training for our dental students, while serving the needs of our community. BCD has proposed three projects for the RHP plan. The other two involve increasing the number of dental students participating in internships in rural and/or underserved areas of the state, and expanded hours for community dental clinics utilizing BCD student clinicians.

Relationship to Other Performing Providers' Projects in RHP

Because we are the only dental performing provider, there is little relationship between this project and other providers' projects.

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation of this project is based primarily on the value of the care provided by the students participating in the school-based sealant program. The population addressed will be second and third grade elementary students in the Dallas and suburban school districts, and the added number treated over the four years of the project will be approximately 5,800. Data from the sealant program, collected over the past ten years, indicates that an average of three sealants are placed in each patient encounter, yielding a total of 17,000 additional sealants placed over the four years of the project, relative to baseline. Based on data from non-profit providers and private practitioners in the Dallas, the average fee for sealants is approximately $30 each. For purposes of this valuation, the cost of screenings and fluoride varnish application is not included. A multiplier of six, higher than for restorative treatment, will be applied to the cost of each sealant. The multiplier incorporates the additional benefit of the fluoride varnish application, the benefit to the community in terms of addressing a high-priority need, reducing school absences and improving academic performance in children, the size of the population served and cost avoidance. Cost avoidance, in terms of treatment averted, is particularly high for sealants. Data from studies of the efficacy, cost-effectiveness and cost-benefit of dental preventive interventions estimate that preventing decay on a tooth can avoid restorative treatment that, over a period of as short as ten years, can total as much as $2,800 per tooth,

more than 90 times the cost of the sealant. Calculations based on cost, the number of sealants placed annually and the value multiplier estimate a total of $355,509 of care delivered in DY2 and approximately $928,000 each year thereafter.

Project Option 1.1.2 – Increase access to primary care – Continuing Care Clinic

Unique Project ID: 020908201.1.1
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Dallas/020908201

Provider: Texas Health Presbyterian Hospital Dallas, part of the Texas Health Resource system, serves a 621.5 square mile area and a population of approximately 2,054,356 people.

Intervention(s): This project will reduce the use of the emergency department by targeting specific individuals with high utilization rates.

Need for the project: We have one physician who will only work specific hours. Need additional staff and resources.

Target population: The target population is patients with three or greater inappropriate ED visits within 1 year, inpatients who need appropriate follow-up care post discharge, and patients who visit the ED that could avoid an inpatient observation admission if there was appropriate follow-up care available.

Category 1 expected patient benefits: This project seeks to provide a bridge from the emergency room to primary care offices.

Category 3 outcomes: IT-3.3 our goal is to reduce the 30-day Diabetes readmission rate by 15%

- IT-3.10 our goal is to reduce the 30-day Adult Asthma readmission rate by 15%
- IT-9.2 our goal is to reduce inappropriate ED utilization by 18%

Project Description

The Continuing Care Clinic (CCC) will provide an alternative lower cost setting of care for patients in the emergency department that are there inappropriately. The patient population will be a convenience sample of unfunded patients with 3 or more visits to the ED in one year. The patients will be directed to an internist, Physician Assistant, or Nurse Practitioner by the ED physician for follow-up care. When the patient does not need urgent or emergent are in the ED or be admitted, the physician will direct them to the CCC. The clinic setting will be in the fast track location of the ED. The Continuing Care Clinic will serve several groups of self-pay patients:

- Patients with 3 or greater inappropriate ED visits within 1 year
- Inpatients who could be discharged sooner if there was appropriate follow up care available

- Patients with an ED visit who could avoid an inpatient or observation admission if there was appropriate follow up care available

Goals and Relationship to Regional Goals

Project Goals

The goals of this project are:

- Reduce inappropriate ED utilization due to lack of access to PCP care
- Enhance timely, safe discharge from inpatient/observation admission/provide follow up care
- Avoid "soft admissions" i.e. patient who are admitted to the hospital due to lack of adequate follow up care because of financial constraints

This project meets the following regional goals:

The plan is to expand the capacity of primary care to better accommodate the needs of the regional patient population and community, as identified by the RHP needs assessment, so that patients have enhanced access to services, allowing them to receive the right care at the right time in the right setting. Our five-year target goal is to substantially decrease the number of emergency department visits, costs associated with visits, and the number of admissions for ED frequent flyers by 18% over the next 5 years. There are a number of patients who are frequent flyers to our ED and are admitted to the hospital within 30 days of their last admission for the same condition. This clinic will provide follow-up care to unfunded patients in a timely manner in an outpatient setting (instead of an ED setting) or assure navigation to another medical home. The overall goal of the project is to reduce ED utilization and readmissions.

Challenges

Texas Health Dallas faces several challenges because THD has a large number of patients who utilize the ED as their source of primary care due to a lack of insurance. The Continuing Care Clinic (CCC) will serve as primary care and will assure referral to another available resource for primary care.

5-Year Expected Outcome for Provider and Patients

The 5-year expected outcomes are:

- Improvement in patient outcomes due to improved compliance with treatment plans

- Decrease in volume of inappropriate uninsured ED visits
- Decrease in self-pay, bad debt and write offs for this population due to a decrease in inappropriate ED utilization

Starting Point/Baseline

The Continuing Care Clinic opened an original location within our ED on October 30, 2012 as an extension of the ED "fast track" location but decided due to space and lack of staff, to move the Continuing Care Clinic to our THD JIMC (Jackson Internal Medicine Clinic) in one of our Professional Buildings connected to the hospital. This new location has ample space for privacy with 15 exam rooms and a nurse's station. It is staffed 6 hours/day 5 days a week by a bilingual internal medicine physician and ED SW Case Managers as needed. The hours of operation are yet to be determined.

We will use 2011 data for the baseline and look at the number of patient visits, associated cost, and number of admissions of the patients who frequently come to the ED.

Continuing Care Clinic	2012	2013 YTD
# of Patients Seen	36	31

Rationale

This project will provide a model for health care delivery of the unfunded, patient population and will achieve a higher quality of life for these patients (decreased sick days, decreased work days missed, decreased cost, decreased risk of complications and decrease in utilization of ED for primary care). In addition, it will demonstrate a decrease in unfunded readmissions and in bad debt load for the hospital.

As cited in the Texas Medical Association – Physicians Caring for Texans, 2009-2010 publication, Texas is the uninsured capital of the United States. For adults (ages 19-64), Texas ranks highest in uninsured rates. The CCC can help by providing primary care for the uninsured population by providing primary care directly or by assuring that the patient is secure in a medical home.

Project Components

The CCC will meet both patient and institutional needs by providing a place for patients that over utilize the ED to receive care in the right setting at a lower cost.

Unique community need identification numbers the project addresses

- CN.3: Healthcare Capacity
- CN.4: Primary care and pediatrics

- CN.8: Specialty care
- CN.11: Patient Safety and Quality

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project would utilize case findings and preventative care for this patient population. It will allow for meeting patient needs before a crisis occurs and teach the patient how to avoid a future crisis.

Related Category 3 Outcome Measures

- IT-3.3: Diabetes 30 day readmission rate
- IT-3.10: Adult Asthma 30 day readmission rate
- IT-9.2: Appropriate ED Utilization

Reasons/Rationale for selecting outcome measures

The prevalence of diabetes and therefore the associated mortality and morbidity have steadily increased (Texas Behavioral Risk Factor Surveillance System 2010) and with increasing numbers of unemployed and uninsured in Texas, there is every reason to believe this population will continue to be uninsured and to use the ED for primary care. A study completed at Columbus Regional Medical Center , Columbus, Georgia , published in "Clinical Diabetes" July 2003, vol 21, no 3, 136- 139, developed a model of inpatient diabetes support designed to reduce inpatient lengths of stay, but more importantly to reduce recidivism rates. This study stratified the diabetic patient needs into 5 "needs" categories. They found that the biggest need was "social and economic service rather than diabetes education." Their program was successful readmission decreased by 74%. This approach will decrease readmissions and visits to the ED.

Asthma is one of the most prevalent chronic diseases in Texas with an estimated 2.2 million (12.2%) reporting lifetime asthma and 1.3 million reporting current asthma. The hospitalization rate in Texas in 2007 was 10.9 per 10000 Texas residents and accounted for an estimated $446.8 million in hospital charges (TX Dept. of Health Services, 4/12). Goals of a study done at Presbyterian Hospital of Dallas in 1997 were to enhance patient self-management through education and follow up, decrease ED visits and support physician treatment plan. All three of the goals were met by using the Asthma Management Program as an adjunct after ED care. The CCC patients will be referred to this program post ED visit. This approach will decrease readmissions and visits to the ED.

Currently in 2012, THD ED staffing is being overwhelmed by large increase of patients entering our ED on a daily bases. The needs of the patients stay consistent but becoming increasingly difficult to manage when specific patients regularly enter our facility for minor or easily manageable health issues. To manage the volume of patients that are coming through our

facilities door, THD ED will need to improve how we utilize our clinical staff as well as reorganize and reprioritize how our clinical staff cares for our patients. Not to minimize the amount of care given but to focus ED's resources to increase care for critical care patients and divert low acute care patients to appropriate staff. The graph below shows the increase in patients as well as how much uninsured patients cost THD.

ED Volume	**2011**	**2012**
# of Patient Visits / Mthly Avg.	76,427 / 6,368	83,888 / 6,990
ED Patients with 3 or < Visits	**2011**	**2012**
# of Patients / # of Visits	3,936 / 16,170	4,627 / 19,486
# of Uninsured / # of Visits	1,112 / 4,644	1,407 / 5900
Direct Cost of Uninsured	$1,912,345	$1,824,190
Charity Sum of Uninsured	$5,297,373	$7,627,350
Staffing	**2011**	**2012**
Staffing OT Cost / Mthly Avg.	$526,443.4/ $43,810	$360,382.3/ $45,047

Relationship to other Projects

This project is related to the Faith Community Nursing/Health Worker Project (020908201.2.2) and Healing Hands Ministries (020908201.2.3). Both of these project goals are to reduce admissions and lower the overall cost of healthcare to the individual and system. These projects will work in tandem with each other to provide access to care unfunded patients.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

This project is establishing a continuity clinic within the ED and is related to other projects that address primary and specialty care but no other project is specific to providing such services within the ED. Baylor Garland (121790303.1.1), Baylor Irving (121776204.1.1), BUMC (139485012.1.1), Children's (1389100807.1.2), and UTSW (126686802.1.2) all have projects in the same category.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable use to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

For every inpatient readmission avoided, $6,285 in cost is saved by the healthcare system[173]. Healthcare costs are calculated by multiplying $6,285 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

For every inpatient readmission avoided, $8,297 in cost is saved by the healthcare system[174]. Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.
For every inpatient readmission avoided, $8,297 in cost is saved by the healthcare system[175]. Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs. Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g. aging populations will have increased admissions due to higher incidence rates), size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g. keeping lower acuity patients under observation instead of admitting them).

Project Option 1.1.1 - Establishing a New Primary Care Community Outreach Center

Unique Project ID: 126686802.1.1
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy Hospitals and 40 clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. Between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 16,175 visits which were specifically at UT Southwestern outpatient practices.

Intervention(s): UTSW will establish a new Primary Care Clinic staffed by two General Internal Medicine physicians and at least two physicians in Obstetrics & Gynecology. As volume and demand warrants it, evening and weekend hours are planned to improve access and capacity.

Need for the Project: As an academic medical center, we currently have a limited capacity in primary care services. The Community Needs Assessment for RHP 9 identifies the lack in primary care capacity, in addition high emergency department utilization for ambulatory conditions, to be areas of particular concern to the Region.

Target Population: The primary service area is everyone living within a 5 mile radius of the clinic. Approximately 5% of our patients are either Medicaid eligible or indigent, so we expect they will benefit from about 5% of the primary care services.

Category 1 or 2 Expected Patient Benefits: The project seeks to provide increased primary care access with approximately 20,000 patient visits each year, with approximately 8,000 unique patients becoming part of the Clinic's panel. Approximately 1000 visits and 400 patients are projected to be Medicaid and low income patients.

Category 3 Outcome Measures:

- IT-12.1 Breast Cancer Screening— By DY5, our goal is to increase the number of women aged 40 to 69 that have received an annual mammogram by X% (TBD) above the DY2 baseline.

- IT-12.3 Colorectal Cancer Screening—By DY5, our goal is to increase the number of adults aged 50 to 75 that have received colorectal cancer screening by X% (TBD) above the DY2 baseline.

- IT-12.4 Pneumonia Vaccination Status of Older Adults—By DY5, our goal is to increase the number of patients who are older adults receiving a pneumonia vaccination by X% (TBD) above the DY2 baseline.

Project Description

UT Southwestern Medical Center is in the process of establishing a new multispecialty clinic in Dallas County that is comprised of both Primary Care and Specialty Care Services. **This proposal addresses solely the Primary Care Clinic Services.** The Primary Care Clinic components are planned to provide two physicians in General Internal Medicine and at least two physicians in Obstetrics & Gynecology. The Primary Care Clinic area will be approximately 6,500 square feet and will include ultrasound, blood drawing space, plain film x-rays, and mammography.

The new clinic will have an electronic medical record that immediately will be integrated into the main UT Southwestern electronic medical record system. This will facilitate and increase referrals to other UT Southwestern specialists, clinics, and sophisticated diagnostic capabilities. Referrals within the system will be tracked.

UT Southwestern will recruit additional physicians to the Faculty Practice Plan to staff this clinic, which in turn will increase the capacity of UT Southwestern Medical Center and RHP 9 to see more patients in new locations. The new location, at Hillcrest and Northwest Highway, will make it easier for patients to access the new providers and services. Parking at the new location is free and easily accessible. The site is also convenient to public transportation from the DART System bus and train lines.

While we do not contemplate training residents at the new location during the first year, the clinic would provide an ideal setting to train medical students and residents in how to practice in a traditional community setting.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

The project goals are as follows:

- Add one additional primary care clinic to be located in the Hillcrest/Northwest Highway area, specifically Hillcrest Crossing.

- Train/hire additional primary care providers and staff.
- Expand the hours at the primary care clinic to include evening and/or weekend hours.
- Over time, increase primary care clinic volume of visits and number of unique patients seen.

This project also meets the following regional goals:

RHP 9 has a primary care provider and capacity shortage. This project addresses increasing access to primary care services and providing high quality, comprehensive care to patients in a less costly setting—a primary care clinic. Emergency Department utilization is unnecessarily high in RHP 9. By providing more patients with the accessible primary care they need, ED utilization should be less.

Challenges

New medical services in new locations face two substantive challenges. First, the community must be made aware of the new clinic and the types of physician services that are available. The second challenge is projecting the appropriate range and level of services to be provided based on demand/need assumptions. A marketing plan is being developed to announce the new Clinical Center that is designed to reach the target populations using web-based and print-based media targeted at service area referring physicians, households, and local newspapers. Based on the Community Needs Assessment, primary care services will be provided on a graduated basis and regulated by the response from the service area community. Other service enhancements will be evaluated based on patient feedback and market demands.

5-Year expected outcome for Provider and Patients:

By the end of Year 5, we hope to have at least three Internal Medicine and two Ob/Gyn physicians practicing full time. We project seeing up to 25,000 patient visits each year, with approximately 8,000 unique patients becoming part of the Clinic's panel. Given the patient-centered approach planned for the Clinic, we project improved outcomes consistent with our goals for Category 3 measures.

Starting Point/Baseline

The new "UTSW Clinical Center at Park Cities" is in the fast-track design-build process. The new clinic is scheduled to open in January 2013. As a result, the baseline is zero for the number of clients served by the project. Projections for unique patients and patient visit volumes in Year 1 of operations are still being determined.

The clinic will require UT Southwestern to recruit new physicians in Internal Medicine, Obstetrics & Gynecology, and selected other specialties depending upon demand. In addition, once the new clinic reaches certain growth projections, evening and weekend hours are planned to further improve access to services.

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by inadequate availability of primary care services.

The RHP 9 Community Needs Assessment Report states, "The demand for primary and specialty care services exceeds that of available medical physicians in these areas, thus limiting healthcare access for many patients needing low level management or specialized treatment for prevalent conditions." In addition, the top five prevalent conditions found in the Emergency Department encounters included hypertension and diabetes which are conditions that could be better managed in ambulatory clinics rather than episodically in hospital Emergency Departments. There is also a significant demand for access to prenatal care in our region. Finally, the report provides data showing that Dallas County has significant HPSA (Health Professions Shortage Areas) and MUA (Medically Underserved Areas) regions that overlap. In order to expand capacity, more primary care and specialty care physicians need to be trained in and/or recruited to Dallas County. At the same time, these physicians need to be distributed more widely to improve access by the patients of RHP 9.

UT Southwestern selected this project, because the project adds a new primary care clinic in the community, increases availability of primary care providers and selected specialists, improves access to primary care and selected specialists, and improves service availability. All patient populations have difficult gaining timely access to primary care physicians and specialists who provide care to patients with complicated or complex medical problems. This new clinic and the new providers address this challenge. The new clinic is part of an innovative strategy to create and operate multispecialty clinics away from the main campus. UT Southwestern Medical Center has limited ability to expand its services to the community due to limitations on its current campus. Travel to the primary care and specialty clinics on the campus can be difficulty due to traffic and complicated directions. Not insignificantly, parking is often difficult and patients must pay for their parking. This new clinic will result in expanded primary care services closer to the communities and populations that want and need improved access to UT Southwestern primary care physicians and specialists. The clinic will be located near several major highways and roads. It is also accessible by the DART System bus and train lines.

By providing a new clinic at Hillcrest/Northwest Highway, UT Southwestern will be able to expand primary care and increase access to selected specialists, as well as primary care physicians, at a location that is easier to find and navigate. Increasing the number of primary care providers will reduce the time it takes patients to obtain appointments, which can reduce the time to needed diagnosis and treatment. Furthermore, creating additional access away from the UT Southwestern Medical Center campus will relieve campus congestion and improve access primary care physicians, as well as improving access to the comprehensive spectrum of specialists and diagnostic services on the campus. Effectively, the new clinic improves access to primary care and specialty care in both the new clinic and to the existing clinics on the UT Southwestern campus.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.3-Healthcare Capacity
- CN.9-Chronic Disease
- CN.12-Emergency Department Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative:

Developing multispecialty clinics into the communities where our patients live is a new undertaking for UT Southwestern. The Medical Center has traditionally had a single campus focus where patients came for both primary care and specialty care. The Clinical Center will improve our ability to provide preventive services, basic primary care and specialty screening services to populations that want access to the quality of services offered by an academic medical center. Given the CNA stated shortage of access to primary care services, the ease of access to the Clinic will significantly improve our ability to meet the needs of the community.

Related Category 3 Outcome Measure(s):

OD-12 Primary Care and Primary Prevention
- IT-12.1 Breast Cancer Screening
- IT-12.3 Colorectal Cancer Screening
- IT-12.4 Pneumonia Vaccination Status of Older Adults

Reasons/rationale for selecting the outcome measures:

As part of a larger Chronic Disease Management strategy, monitoring indicators that will help detect problems and slow the progress of the disease are high priorities. The Community

Needs Assessment reported DFW Hospital Council data took note of the hospital admissions related to breast cancer and colorectal cancer. It also reported that admissions for diabetes sometimes had pneumonia as an accompanying complication. In order to provide these Primary Care Prevention outcomes, primary care providers must conduct regular basic health care examinations and help their patients develop a prevention-minded orientation to their health. The selected outcome measures are appropriate indicators of success in that effort.

Relationship to other Projects

This project relates to all of the other proposed projects in terms of improving access, capacity and performance across all primary care settings. The specific projects include:

126686802.1.1.2	Expand existing primary care capacity
126686802.1.7.1	Implement telemedicine program
126686802.2.1.1	Enhance/Expand Medical Homes

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

There are three other Category 1.1.1 projects in the RHP 9 Plan being proposed by Baylor Medical Center at Carrolton, CMC of Dallas, and Medical City Dallas Hospital. There are eight Category 1.1.2 projects seeking to expand existing primary care access. Furthermore, there are nine 2.1.1 projects that will develop or expand Patient-Centered Medical Homes. All of these efforts seek to provide better access and improved primary care prevention efforts.

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criterion rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using the criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criteria: 6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criteria: 3.85**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criteria: 4.0**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criteria: 5.0**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criteria: 7.0**

Total Valuation Score for this project: **4.8**

***Project Option 1.1.2* - Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics**

RHP Project Identification Number: 126686802.1.2
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern") Faculty Practice Plan/126686802

Summary Information:
Summary Description: The UTSCAP Primary Care Network (the "Network") is designed to expand access to primary care resources in RHP 9 and integrate community-based primary care physicians and UTSW faculty physicians. The Network is actively recruiting community-based primary care physicians to join UT Southwestern. The goal of the Network is to expand physician acceptance of all payor sources, improve capacity, improve access, and improve quality through use of a common EMR and numerous other quality initiatives . In addition, this project will create a nurse advise line for all patients of the UTSCAP Network.

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 40 hospital-based and ambulatory-based clinics on its Dallas campus. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas.

Intervention(s): The project will expand the primary care capacity in RHP 9: [1] by having physicians who don't currently avail themselves to certain payor segments (i.e. Medicaid) agree to open their panels to these patients; [2] by Network physicians agreeing to after-hours care and/or weekend hours; [3] by Network physicians adding new partners out of residency; and [4] by optimizing throuput. Project also adds primary care resources through new nurse advise line.

Need for the Project: Primary care capacity in our Region is limited, siloed and operating inefficiently. Finally, RHP 9 identified a lack of primary care capacity, coupled with high rates of ED usage and readmissions, as areas of great concern for our Region.

Target Population: The target population is the 2.416 million people living in Dallas County, 25.4% of whom are uninsured. Dallas County also includes over 413,000 Medicaid enrollees.

Category 1 or 2 Expected Patient Benefits: This project seeks (1) to expand access to primary care resources in the Region, 2) to increase the volume of primary care visits under the UTSCAP Network and (2) to increase the number of Network patients served by our new nurse advice line. Through this Network, our expectation is that UTSW will substantially add to the number of patients in RHP 9 that will have access to high quality, integrated care that has historically been unavailable. We anticipate adding 126 or more primary care physicians to this Network. UTSW expects that by DY5 approximately 44,000 Medicaid/low income patients per year would benefit from this Network expansion resulting in 111,000 office visits, 178,000 patient contacts,

and access to additional primary care resources through the new Nurse Call line. Adding and/or expanding practices will increase office hours, staff hours, and office space for Medicaid patients.

Category 3 Outcome Measures: IT-12.1 Breast Cancer Screening, IT-12.3 Colorectal Cancer Screening, and IT-12.4 Pneumonia Vaccination Status of Older Adults

Project Description

UT Southwestern proposes to expand the primary care capacity in the UTSCAP Primary Care Network to better accommodate the needs of RHP 9 patients and the community.

The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term objectives for the Network include:

- Expanding access to primary care resources for RHP 9 patient population.
- Expanding, strengthening and implementing a clinically integrated network;
- Creating and implementing a quality care model that will most efficiently utilize finite primary care resources for patients of RHP 9.
- Developing an infrastructure for effective care coordination of Network patients;
- Enhancing and continually developing a clinically integrated organizational structure in preparation of health care reform and value-based reimbursement; and
- Advancing the use of technology to improve health care and reduce medical errors.

This project will improve access to primary care services by creating a robust Network of efficient, quality primary care physicians for RHP 9 patients. Specifically, the Network intends to expand primary care capacity and enhance both efficiencies and quality performance by:

- Having physicians who don't currently avail themselves to certain payor segments (i.e. Medicaid) agree to open their panels to these patients. Therefore, although some may be existing community PCP resources, we will be expanding access to primary care resources for our targeted populations;
- Working with Network physicians to participate in after-hours care programs and/or weekend clinic availability along with additional primary care resources via the Nurse Call line;
- Adding new physicians to the Network and enabling patient panel expansion;
- Facilitating Network physicians adding new partners out of residency or outside the RHP 9;
- Requiring the use of an EMR for all network providers to help optimize throughput; and
- Requiring providers to participate in quality enhancement programs of Network (i.e. quality standards, protocol adherence, progressing towards PCMH principles, etc.).

As community-based primary care physicians join the Network, they will no longer be practicing in "isolation". Through clinical integration with UT Southwestern faculty physicians, these community-based primary care physicians will engage in the continual development and implementation of clinical "best practice" protocols for the diseases treated by all Network physicians that are also responsible for the largest percentage of medical costs, such as diabetes and hypertension. In addition, the project will also expand access to primary care services at the point of need by providing Network patients' access to a 24/7 nurse advice line. By developing a nurse triage line capability, we intend to help patients make better decision regarding whether an office visit or other care is necessary, expanding access to primary care services while potentially freeing up PCP office capacity. Overall, the Network is aimed at expanding access to primary care by adding PCP capacity and through the efficient and effective delivery of quality primary care.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relations to Regional Goals:

The project goals are as follows:

- Expanding access to primary care resources for RHP 9 patient population;
- Create an environment within the Network whereby community-based primary care physicians who don't currently treat certain patients (i.e. Medicaid), open their panel to a broader patient population;
- Expand primary care capacity through efficiencies and access to a shared Network population management infrastructure to address the primary care needs of our patient population;
- Implement a nurse advice line accessible to patients throughout the Network to enhance patient access to the right care, at the right time, in the right setting, and by the right provider;
- Offer clinical expertise and management support for new and existing primary care physicians that enable them to efficiently care for more patients.

All of these goals are aimed at patients receiving the right care, at the right time, in the right setting, and by the right provider

This project also meets the following regional goals:

RHP 9, and the Nation, has a primary care provider and capacity issue. This project aims to address increasing access to primary care and providing high quality, comprehensive care to patients in a less costly setting—an integrated primary care Network. Emergency Department

utilization is high in RHP 9 and by providing more patients with the primary care they need, a regional goal is to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges

One of the major challenges for RHP 9 and the healthcare market in general is a shortage of primary care physician capacity. This problem is likely to worsen in a healthcare reform environment where more people are expected to have insurance coverage. The primary ingredient in the cost reduction recipe is for more patients to be seen in a primary care setting in lieu of specialty offices, ER, urgent care, or inpatient facilities. Another major impediment in RHP 9 to enhanced productivity in primary care settings is the extensive number of solo to very small primary care practices that exists within our community.

Finally, many primary care physicians don't treat all types of insured patients, because the economics associated with some payor sources are a major challenge to the viability of practices. These are only a few of the many challenges facing the effort to expand primary care access in RHP 9. To address these challenges UT Southwestern intends to hasten the "virtual" consolidation of these private practices through their membership in the Network and into population management units with access to shared resources enabling the expansion of primary care access to RHP 9 patient populations. By creating a Network that incents broader payor participation and facilitates caring for these patients more efficiently, UT Southwestern will enable expanded primary care capacity, ensuring more patients have access to high quality, cost effective primary care.

5-Year expected Outcomes for Provider and Patients:

The 5-year expected outcome of this initiative will be enhanced access and quality for patients seeking primary care, as well as the Network physicians' ability to measure, monitor, and provide increased services to the patient population of RHP 9. Through this Network, our expectation is that UTSW will substantially add to the number of patients in RHP 9 that will have access to high quality, integrated care that has historically been unavailable. We anticipate adding 126 or more primary care physicians to this Network. UTSW expects that by DY5 approximately 44,000 Medicaid/low income patients per year would benefit from this Network expansion resulting in 111,000 office visits, 178,000 patient contacts, and access to a new Nurse Call line. Adding and/or expanding practices in the Network should result in 68,000 office hours, 238,000 office staff hours, and around 21,000 square feet of office space available to Medicaid patients. Overall, by DY5 UTSW expects approximately 277,000 patients per year will benefit from this Network expansion, resulting in 693,000 office visits, 1,100,000 patient contacts, and access to a new Nurse Call line. In total, adding and/or expanding practices in the Network should result in 242,000 office hours, 846,000 office staff hours, and around 151,000 square feet of office space. Due to the impact of health reform, the economy, patient migration, etc., it's impossible to predict how many new unique vs. existing market patients will utilize the Network. However, by adding primary care access through opening provider panels, increasing efficiency to allow expanded panel sizes, adding new physicians, and introducing

new primary care resources (e.g. Nurse Call line), UTSW will expand primary care access to patients of RHP 9.

Starting Point/Baseline

The development of a clinically integrated Network of community-based, primary care physicians and UT Southwestern faculty physicians supported by a robust population management infrastructure does not currently exist. Thus, the starting point for this project (the one-year period prior to December 1, 2011) is as follows. UT Southwestern has three (3) primary care clinics: the Aston Clinic, the Multi-Specialty Clinic and the Family Practice Clinic. The community-based, primary care clinics that are members of the UTSCAP Network totaled three (3). Neither the Network nor UT Southwestern has implemented a nurse advice line to assist patients with information and advice at their point of need.

Rationale

More often than not, patients receive services in urgent and emergent care settings for conditions that could be managed in a more coordinated manner if provided in the primary care setting. This often results in more costly care and sicker patients.

UT Southwestern physician services are directly impacted by the negative outcomes created by inadequate access to efficient, quality primary care services. By enhancing access points into an integrated primary care Network throughout the community, available appointment times, patient awareness of available services and overall primary care capacity, patients and their families will align themselves with the primary care system resulting in better health outcomes and appropriate utilization and reduced cost of health care services delivered.

For these reasons, UT Southwestern chose this project to address the shortage of primary care physicians willing to treat all patients under the current environment. We believe the problem is likely to worsen in the healthcare reform environment. If the objective is to improve quality, reduce cost, and improve outcomes, expanding access to primary care services is going to be a critical part of the solution. The more care that can be pushed towards primary care, the better we can decompress ER's, specialty clinics, and facilities.

In the RHP 9 market today, there has been little attention or resources provided to creatively engage independent, community-based primary care practices in a population management solution for all populations. For a number of the reasons outline above, providers and health systems have been focused on developing business strategies around commercial populations where investments of finite resources have a more reasonable chance of a return on the investment.

Project components, milestones and metrics:

Through this project, we propose to meet all the required project components:

- Expand primary care clinic space. The integration and expansion of community-based primary care physicians into the Network, along with the efficiency goals of the Network will create increased clinic space throughout the Network.

- Expand primary care clinic hours. The integration and expansion of community-based primary care physicians in the Network will include clinics with expanded/after-hours care.

- Expand primary care clinic staffing. The integration and expansion of community-based primary care clinics into the Network, will result in an increase in primary care clinic staffing within the Network devoted and trained to delivery efficient, quality health care services.

To accomplish UT Southwestern's ultimate goal to expand primary care capacity to accommodate RHP 9 patients receiving the right care, at the right time, in the right setting, and by the right provider, we must focus on key areas. Thus, UT Southwestern will expand primary care capacity and access through the following selected milestones for this project:

- Establish additional/ expand existing/ relocate primary care clinics;

- Implement a nurse triage software system to assist nurses in determining the acuity of patients;

- Establish a nurse advice line; and

- Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

Community Needs Addressed

The specific and unique community need identification numbers that this project addresses include the following:

- CN.2-Regional Healthcare Infrastructure and Patient Migration Patterns

- CN.3- Healthcare Capacity

- CN.4-Primary Care and Pediatrics

- CN.12-ED Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform:

This project represents a new reform initiative for UT Southwestern. UT Southwestern in collaboration with community primary care providers will support the delivery of quality, evidence-based, efficient primary care through this clinically integrated Network. This solution will be an enhancement over the existing, "silo" delivery system by addressing the challenges highlighted above, and embracing the challenges of all patient populations. By incorporating the needs of these populations in the development of a population management infrastructure, the system for delivering primary care will improve. UT Southwestern will work independently, with our campus partners, and with community partners to establish clinics capable of delivering high quality primary care and making appropriate referrals to specialists and facilities.

Related Category 3 Outcome Measure(s)

OD-12 Primary Care and Primary Prevention Outcomes:

- IT-12.1 Breast Cancer Screening (HEDIS 2012)
- IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
- IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Reasons/rationale for selecting the outcome measures:

Our expansion of existing primary care capacity in the UTSCAP network is aimed at improving the delivery of care, at the right time, in the right setting. We selected the above outcomes because expanding access to primary care services should result in the increased incidence of preventative services actually delivered to patients. We subscribe to the theory that screening programs should lead to a cost-effective reduction in disease burden. UT Southwestern will focus on this outcome for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects:

The success of this initiative is highly dependent on the implementation of the following other projects proposed by UT Southwestern:

- *126686802.2.1.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network: 126686802.1.1.4—Implement a Quality Incentive Program for Network Primary Care Providers:*
- *126686802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development*
- *126686802.2.9.1—Implement/Expand Care Coordination Programs:*

Relationship to Other Performing Providers' Projects and Plan for the Learning Collaborative

Other projects that focus on expanding primary care are: 121790303.1.1, 121776204.1.1, 195018001.1.1 139485012.1.1, 138910807.1.1, 138910807.1.2, 020943901.1.3, 127295703.1.1, 127295703.1.2, 020908201.1.1.

The providers of these projects have confirmed that: 1) we each serve distinct geographical areas and/or 2) populations of the underserved.

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criteria: 4.5 X 2 = 9**
2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criteria: 3.5 X 2 = 7**
3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criteria: 4.5 X 2 = 9**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criteria: 3.8 X 2 = 7.6**
5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criteria: 4 X 2 = 8**

Total Valuation Score for this project: **8.2.** These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option 1.1.4 - Implement a Quality Incentive Program for UTSCAP Network Primary Care Physicians

Unique Project ID: 126686802.1.3
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/126686802

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 40 hospital-based and ambulatory-based clinics on its Dallas campus. UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, 24% of UTSW patient charges were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will expand primary care capacity in the Region while simultaneously providing evidence-based care by developing and implementing a quality incentive program to improve the delivery of safe, quality primary care services in our community.

Need for the Project: Primary care capacity in our Region is limited, siloed and operating inefficiently. RHP 9 identified a lack of primary care capacity, coupled with high rates of ED usage and readmissions, as areas of great concern for our Region. The Community Needs Assessment for RHP 9 discusses the objective of implementing novel approaches to quality improvement for addressing the health needs of our community. It is not enough to expand the primary care capacity in our community. We must also improve the delivery of quality primary care services. Without the delivery of quality primary care, the occurrence of high emergency department utilization for ambulatory conditions and other inefficiencies in our Region will continue.

Target Population: The target population is all UTSCAP Network patients with an emphasis on Medicaid patients. There are 2.416 million people living in Dallas County, 25.4% of who are uninsured. Dallas County also includes over 413,000 Medicaid enrollees.

Category 1 or 2 Expected Patient Benefits: This project seeks to expand access to primary care resources in the Region, while simultaneously incenting high quality, evidence-based care. By DY5, UT Southwestern expects the majority of UTSCAP Network physicians will meet established "gateway" requirements and metrics - see Appendix A, B, and C. We expect patients will benefit from having enhanced access to primary care services and care givers who adhere to evidence-based practices. Results found in the literature of pay-for-performance are included in Appendix D.

We anticipate adding 126 or more primary care physicians to this Network. UTSW expects that by DY5 approximately 44,000 Medicaid/low income patients per year would benefit from this Network expansion resulting in 111,000 office visits, 178,000 patient contacts, and access to a new Nurse Call line.

Category 3 Outcome Measures:

- IT-12.1 Breast Cancer Screening.
- IT-12.3 Colorectal Cancer Screening
- IT-12.4 Pneumonia Vaccination Status of Older Adults

Project Description

UT Southwestern proposes to develop and implement a quality incentive program to improve the delivery of safe, quality primary care services in our community.

The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term objectives for the Network include:

- Expanding access to primary care resources for RHP 9 patient population (emphasis on Medicaid), while aligning incentives for quality outcome performance.
- Develop a quality incentive program for primary care providers focused on access and quality outcomes;
- Develop the infrastructure to effectively measure and monitor primary care provider adherence to established evidence-based protocols;
- Implement the quality incentive program to RHP 9 primary care physicians clinically integrated with UT Southwestern; and
- Monitor participating providers on a regular basis to ensure evidence-based, quality care is being provided.

This project is designed not only to expand access to primary care, but to increase the quality of primary care delivered to Network patients. It is also intended to create an environment whereby primary care physicians who don't currently treat certain patients (i.e. Medicaid, begin seeing all populations as a viable part of a broader patient population management program. This quality incentive program is expected to motivate community-based primary care

physicians affiliated with the UT Southwestern to become Medicaid providers, since only Network physicians who are Medicaid providers are eligible for the quality incentive program. We believe this quality incentive program will be good for the physicians, the community and the Medicaid program.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relations to Regional Goals:

The primary goal of this project is to expand primary care capacity and increase the *quality* of primary care through an incentive program rewarding Network physicians for the investments in and accomplishments made in delivering evidence-based quality care to Network patients. UT Southwestern will achieve this primary goal by attaining the following project goals:

- Developing a pay-for-performance program that is attractive to primary care providers because it incents quality and defrays the cost associated with participating.
- Establish Utilization and Quality Improvement Committees that includes representation of UTSCAP Network physicians—both UTSW faculty primary care physicians and affiliated community-based primary care physicians.
- Review nationally recognized quality measures and establish a menu of quality measures for the Incentive Program.
- Create an electronic "Network Clinical Protocol Library" that is readily available to Network physicians.
- Measure and report the menu of quality measures to Network primary care physicians
- Improve adherence to clinical protocols and achieve measureable, improved quality within the Network.
- Require providers submit electronic data to CDR to facilitate monitoring protocol adherence
- Require providers install an EMR.

This project also meets the following regional goals:

The project aims to expand Region primary care resources and deliver *quality*, comprehensive care to patients in a less costly setting—an integrated primary care Network. Emergency Department utilization is high in RHP 9 and by providing patients with the quality primary care

they need, when they need it, the regional goal can be attained to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges

The specific challenge facing many primary care providers is the cost associated with investing in quality programs that are simply not reimbursed in most of today's contractual arrangements. While new models are emerging to defray the costs associated with providers delivering services that lead to quality outcomes, these arrangements are either greatly fragmented or non-existent in RHP 9 today. RHP 9 needs to address this challenge by developing a program that encourages providers to make the investments necessary to measure, monitor, and improve evidence based performance that is applicable to all patient populations in RHP 9. Another major impediment in RHP 9 to enhanced quality in primary care settings is the number of solo to very small primary care practices that exists within our community. Finally, many of these primary care physicians don't treat all patients because the economics associated with some payor sources (i.e. Medicaid), are a major challenge for practices.

To address these challenges UT Southwestern intends to develop a robust program of measuring and monitoring provider performance within the Network against various nationally recognized quality measures/benchmarks for Network patients. UT Southwestern believes providers will make the quality care investments necessary if they have the opportunity to be compensated for meeting quality measures/benchmarks.

5-Year expected Outcomes for Providers and Patients:

The 5-year expected outcome of this project will be expanded primary care access and the development and implementation of a quality incentive program that financially rewards physicians who provide high quality patient care to all patient populations in RHP 9. To qualify for program participation, primary care physicians must participate in the Medicaid program. We anticipate adding 126 or more primary care physicians to the Network and that 25%-40% will participate in this quality incentive program. UTSW expects that by DY5 approximately 44,000 Medicaid/low income patients per year would benefit from this Network expansion resulting in 111,000 office visits, 178,000 patient contacts, and access to a new Nurse Call line. Due to the impact of health reform, the economy, patient migration, etc, etc.., it's impossible to predict how many new unique vs existing market patients will be impacted by this program. However, by adding primary care access through opening provider panels, increasing efficiency to allow expanded panel sizes, emphasizing evidence based quality metrics, rewarding primary care physicians for their quality results, and introducing new primary care resources (e.g. Nurse Call line), UTSW will expand primary care access to patients of RHP 9. This will lead to UT Southwestern simultaneously expanding access to primary care services to all populations while making the investments necessary to ensure and demonstrate the quality of those services being delivered. UT Southwestern feels the impact of this initiative in the overall success of UT Southwestern's efforts to expand primary care access in RHP 9 will be vital. Patients will

witness the significance of this project by the impact it will have on their ability to gain access to *quality* primary care services on a timely basis.

UT Southwestern believes this type of program has been successful in other parts of the country. For example, in 2005, Geisinger Health Plan introduced the web-based Physician Quality Summary, which compares the performance of contracted primary care practice sites on nine clinical quality and patient service metrics using a three-star rating system. Practices that achieve three-star rankings are eligible for financial rewards. From 2005 to 2007, Geisinger primary care clinic sites increased their three-star rankings threefold (from 22% to 69% of their rankings) as a result of improvements driven by systems such as patient registries and automated preventive care notifications (Exhibit 7). There was little change in rankings of non-Geisinger-contracted sites during this time, with their three-star rankings remaining at about 6 percent to 7 percent. Find the full case study and additional supporting information in Appendix D.

Starting Point/Baseline

UT Southwestern is actively engaged in creating a culture of patient safety and quality through educational means; this project will be the next step in the transformation towards a quality-driven and informed delivery of primary care services. The UTSCAP Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. In DY3, we will report on the number of Network physicians that will be the basis for measuring improvement through this project. As of December 1, 2011, UT Southwestern and its Network has not established a menu of nationally recognized, quality improvement measures, nor has it created a quarterly reporting mechanism to inform physicians of their status in delivering quality, primary care services. In addition, the Network does not have a quality incentive program for Network physicians. Thus, the starting point for this project is zero (0).

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, 24% of UTSW patient charges were attributed to Medicaid patients across Parkland, Children's and UT Southwestern. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inefficient, ineffective care delivery.

UT Southwestern is uniquely positioned to influence a practice's decision to participate in quality assurance programs to benefit all RHP 9 patient populations by virtue of our extensive and combined experience in teaching, research, and clinical performance. There are a number of other very tangible benefits associated with participating in UT Southwestern's clinically integrated network (the UTSCAP Network), and we believe community physicians will embrace

the opportunity to partner around this quality initiative. However, this influence alone will not be sufficient to have the impact necessary to meaningfully increase primary care capacity for this patient population. Making it economically feasible for practices to provide care in the right setting, at the right time, and by the right provider will hasten the transition towards the delivery of quality primary care in RHP 9. This program will better align provider incentives, with the quality care model they desire to provide, and provide high quality, cost effective primary care access to RHP 9 patient populations.

Finally, current reimbursement models represent a substantial obstacle for physician practices implementing evidence-based initiatives. Today's system can perversely encourage physicians to minimize access for certain patients and attempt to see extensive number of other patients each day in order to make ends meet. Under this scenario, physicians can't spend the amount of time necessary to deal with health issues they might otherwise be able to address in the primary care office. As a result, patients are often referred into specialists for care that could otherwise be provided in a primary care office. This leads to long waits in specialty clinics and a system cost that is higher than it needs to be. Even worse, long delays for specialty care often lead patients to seek care in hospital emergency departments, which further financially burdens the system. UT Southwestern anticipates that by providing this quality incentive program, all RHP 9 patients, including those not currently experiencing a fully integrated and incentive aligned model, will enjoy higher quality care and an enhanced patient care experience.

Project Component:

To accomplish UTSW's ultimate goal to expand primary care capacity to accommodate RHP 9 patients receiving the right care, at the right time, in the right setting, and by the right provider, we must focus on multiple key areas. The core element necessary for success is to implement an evidence-based quality assurance program that will incent primary care providers in RHP 9 to innovate on quality assurance for all patient populations. To progress towards this objective, UTSW has selected a number of milestones and metrics that are relevant to the community needs and priorities of RHP 9

Community Needs Addressed

The specific and unique community need identification numbers that this project addresses include the following:

- CN.9-Chronic Disease
- CN.11-Patient Safety and Quality
- CN.12-Emergency Department Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative:

Most experts agree that addressing reimbursement incentives is a key component significantly enhancing the existing delivery system. Said differently, we have to pay for what we want from

healthcare providers. Therefore, we believe an important part of the solution to expanding primary care access will be to financially enable finite primary care resources to make the investments necessary to provide evidence-based quality care to all patient populations. However, adding money to the system alone will not adequately resolve the issue. For this reason our proposed solution requires physicians to first open up their practice to patients, meet quality requirements, which will then result in the distribution of quality incentive payments. As described earlier, this is similar to other reform initiatives where physicians have to meet various objective quality standards before participating in financial incentives. The enhancement derived from this program is that it provides this incentive to provide quality care to the broader RHP9 patient population.

Related Category 3 Outcome Measure(s):

OD-12 Primary Care and Primary Prevention Outcomes:

- IT-12.1 Breast Cancer Screening (HEDIS 2012)
- IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
- IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Reasons/rationale for selecting the outcome measures

Our development and implementation of a quality incentive program available to UTSCAP Network physicians is aimed at increasing the likelihood of desired health outcomes. We selected the above outcomes because measuring, reporting and acting upon quality improvement measures for primary care should result in the increased incidence of preventative services actually delivered to patients. We subscribe to the theory that screening programs should lead to a cost-effective reduction in disease burden. UT Southwestern will focus on these outcomes for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects

The success of this initiative is highly dependent on the implementation of the following other projects proposed by UT Southwestern: This project is tightly linked to the following RHP projects:

- ***126686802.2.2.2—Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement.***
- ***126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics.***
- ***126686802.2.1.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network.***

- ***126686802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure.

- ***126686802.2.9.1—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

- ***126686802.2.12.1—Expanding Care Transition Programs:*** The development, implementation and evaluation under standardized protocols and evidence-based care delivery model through a network of post-acute care providers to improve the care delivered to people during transitions of care will rely heavily on robust population management infrastructure.

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criterion:

1. Transformational Impact (Weight=20%): Points were awarded for projects that meet the community benefit criteria. Score– 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criterion: 5 X 2 = 10**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criterion: 4.5 X 2 = 9**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criterion: 4.5 X 2 = 9**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criterion: 4.7 X 2 = 9.4**

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criterion: 5 X 2 = 10**

Total Valuation Score for this project: **9.4**
These values are provided for in the table below and are allocated equally amongst the milestones.

Appendix A

1.0 COMPREHENSIVE PRIMARY CARE INITIATIVE PHYSICIAN GATEWAY REQUIREMENTS (Prospective Incentive)

A practice must be a primary care practice and as such:

- Provide the first point of contact for patients and ongoing care;
- Led by a board-eligible PCP, geriatrician or advanced practice nurse (as allowed by state law);
- Composed of predominantly, but not necessarily exclusively, primary care providers;
- Provide predominantly, but not necessarily exclusively, primary care services;
- Have National Provider Identifiers (NPIs) and Tax Identification Numbers (TINs);
- Be geographically located in a selected market;
- Open to Medicaid beneficiaries;
- Building toward a critical mass of beneficiaries supportive of population management principles;
- Use an electronic health record (EHR) system and qualify for meaningful use incentives or successor programs;
- Implementation of applicable patient registry and/or point of care tools required to satisfy applicable reporting;
- Use of electronic system to write prescriptions;
- Meeting participation (regional meetings, governance, etc.);
- Cooperation with Care Coordination Program and Staff; and
- Endorse and integrate PCMH principles leading to future NCQA PCMH Recognition.

Appendix B

2.00	COMPREHENSIVE PRIMARY CARE INITIATIVE GATEWAY METRICS (Retrospective Incentive)		
2.01	Health Risk Assessment Completion / Submission	As Indicated - All Applicable Patients	Complete and submit specific risk assessment from with appropriate diagnoses and reimbursement codes
2.02	Percentage extended exam within past 12 months	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.03	Childhood Immunization	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.04	Adult influenza immunization	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.05	Patient education provided for obesity	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.06	Well-baby patients utilizing benefits	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.07	Medical assistance with smoking cessation	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.08	BMI assessed and documented	As Indicated - All Applicable Patients	As recorded in applicable EMR field
2.09	Medication monitoring (appropriate lab annually)	Patients on ACE/ARB, Digoxin, Diuretic, or Anti-convulsants	ACE/ARB, Digoxin, or Diuretic – Serum K+ yearly with either Cr or BUN Anti-convulsant – Drug level yearly
2.10	Generic medication utilization	Generic Rate % on All Prescriptions	Generic drug days as percentage of all drug days filled based on prescription data
2.11	Inpatient follow-up	All patients discharged from hospital	Office appointment or consult billed within 7 days of hospital d/c

Project Option 1.7.1 - Introduce, Expand, or Enhance Telemedicine/Telehealth

***Unique Project ID*:** 126686802.1.4
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s): This project will implement telemedicine to provide specialty care support and consultation throughout the UTSCAP Primary Care Network to better accommodate the needs of RHP 9 patients and the community.

Need for the Project: As we build the UTSCAP Network and actively recruit community-based primary care physicians and their practices into the Network, we must be able to provide the patients of these clinics with cost-effective specialty care access and services.

Target Population: The target population is our UTSCAP Network patients receiving primary care and potentially needing access to specialty care. Approximately 3% of our patients are either Medicaid eligible or indigent, so we expect they will benefit from 3% of the telemedicine consults.

Category 1 or 2 Expected Patient Benefits: UTSW will substantially add to the number of patients in RHP 9 that will have access to telemedicine services. We anticipate adding 126 primary care physicians to the Network and promoting telemedicine opportunities to these physicians and their patients. UTSW expects this will mean by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could avail themselves of some type of telemedicine services.

The project seeks to determine needs by specialty to increase access to primary care and referrals. This will include education of the providers and patient population as well as establish 2 or more UTSCAP Network telemedicine-enhanced clinics that include services such as evaluation, diagnosis, treatment and education by specialty physicians. We expect to provide 100 telemedicine visits and 10 or more visits per month in 2 or more clinics identified as 'high need' by DY 5. In addition, further extending the reach of the program will be

application of telehealth/telemonitoring activities for the more acute or complex patients that will keep their health monitored more closely and reduce or avoid acute and ER risk.

Category 3 Outcome Measures:

- IT-1.6 Cholesterol Management
- IT-1.7 Controlling high blood pressure
- IT-1.10 Diabetes Care: HgbA1C

Project Description

UT Southwestern proposes to introduce access to specialty care support and consultation via telemedicine to the UTSCAP Primary Care Network to better accommodate the needs of RHP 9 patients and the community.

The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term objectives for the Network include:

- Expanding, strengthening and implementing a clinically integrated network;
- Developing an infrastructure for effective care coordination of Network patients;
- Enhancing and continually developing a clinically integrated organizational structure in preparation of health care reform and value-based reimbursement; and
- Advancing the use of technology to improve health care, extend access, and reduce medical errors.

This project will improve access to specialty care services by defining and creating a robust telemedicine system connecting Network primary care physicians and their patients with Network specialists. As community-based primary care physicians join the Network, they will no longer be practicing in "isolation" and be given direct and consistent access to specialists for Telehealth evaluation and referral activities. Through clinical integration with UT Southwestern faculty physicians and access to the Network's telemedicine system, these community-based primary care physicians will engage in the continual development and implementation of clinical "best practices" with the Telemedicine enhancements for District patients. Overall, the telemedicine program is aimed at telemedicine encounters becoming an important part of introducing patients early into needed specialty care or, just as important, determining that specialty care is not needed at that time. Additionally, ongoing connectivity to specialty care

will improve outcomes by reducing the incidence of complications through early assessment, detection, and chronic-case monitoring.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relations to Regional Goals:

The goals of this project are as follows:

- Identify needed specialty services that can be delivered via telemedicine through the completion of a comprehensive needs assessment.
- Implement a telemedicine program for selected medical specialties, based upon regional and community need.
- Provide Network patients in need of selected medical specialty services access to these services via a specific telemedicine delivered service.
- Provide UTSCAP Primary Care clinics access to the telemedicine specialty services for specialty telemedicine visits.
- Partner with our community-based physicians to improve chronic disease management and reduce potentially preventable readmissions.
- Implement tele-monitoring of indicated patients to maximize avoidable deterioration of conditions and improve quality of life while reducing unnecessary acute / ER care.

This project also meets the following regional goals:

A goal of the region is to provide improved access to specialty care at the right time to meet the needs of our patients, to improve the health of our patients, and to create a "real system" of care delivery. This project would contribute to achieving that goal by expanding access to specialty care services via telemedicine. In addition, emergency department utilization is high in RHP 9 and by providing more patients with timely access to specialty care, this project helps achieve the a regional goal to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges:

Today, telemedicine services remain largely un-reimbursable and rules to change historical patterns or care are not fully finalized. Current solutions for cross-consultation are primarily informal peer-to-peer relationships established over time with appointment referrals directed for an office visit. The UTSCAP Network physicians (both UT Southwestern faculty physicians and the affiliated community-based primary care physicians) will require evaluation,

infrastructure, training and socialization into the improved access afforded through the proposed telemedicine program project.

Within the Network, telemedicine development would be introduced in phases as regional relationships are established and medical homes are expanded. A key challenge is the geography and large number of providers and health systems where patients may present themselves. Another challenge is the deployment of the technology necessary to support the geography and build a model responsive to the needs of patients and their physicians. Patients would have to be identified as candidates based on condition in advance or early within a visit to bring together the timing of a telemedicine events. UT Southwestern would overcome these challenges by carefully evaluating the necessary deployment of the technology, sharing information in a secured way, introducing Network physicians into the telemedicine environment and developed protocols specific to the use of telemedicine in the delivery of care, and educating patients to the benefits of access to specialty services via telemedicine. As there is more to the project than creating the technology, the investment in technology, integration, education, and cooperation of the providers will be a challenging task that has a high reward for the investment in building another entire channel to care that will not impede schedules or traditional visits for those confirmed to need a direct consultation or referral.

5-Year expected outcomes for providers and patients:

Between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. UTSW will substantially add to the number of patients in RHP 9 that will have access to telemedicine services. We anticipate adding 126 primary care physicians to the Network and promoting telemedicine opportunities to these physicians and their patients. UTSW expects this will mean by DY5 approximately 277,000 patient, including 44,000 Medicaid/low income patients, could avail themselves of some type of telemedicine services. While not all patients will utilize telemedicine services, there will be available access. We anticipate 1,100,000 overall and 177,000 Medicaid/low income primary care patient contacts per year in DY5. Over the course of this project we expect this enhanced care access will reduce unnecessary utilization and provide care that would otherwise be provided in higher cost settings.

The implementation of a telemedicine program will expand access to specialty care within our region. As we identify the specialty services in the greatest demand within our region and address this need through the telemedicine program, the 5-year expected outcome will be the establishment of UTSCAP Network telemedicine-enhanced clinics that provide at least ten telemedicine visits per month. Patients will have received access to Specialists within a Primary Care visit to diagnostic and treatment consultative services via a specific telemedicine delivered service. Direct Telemedicine visits for specialty services/evaluations will also be conducted at a decreased resource / time level relative to traditional visits. Finally, physicians will be educated and inclined to utilize an integrated Telemedicine approach into their practice patterns to improve efficiency while extending their reach for the community.

Patient outcomes will be improved by the resulting increase in access points to specialty services. We anticipate that patients will be engaged earlier and connected more frequently in a way that supports earlier specialist consultation and clinical evaluation, diagnosis and treatment, monitoring, and education on improving health.

Starting Point/Baseline

UT Southwestern has some experience with delivering telemedicine services. For example, UT Southwestern has provided teleradiology services and wound-care telemedicine services for residents of the Denton State Supported Living Center (DSSLC). DSSLC is the largest of 12 State Living Centers in Texas and home to over 525 intellectually and physically disabled individuals. DSSLC is located on 200 wooded acres in Denton County. However, the starting point for this initiative is zero (0) since this telemedicine program is designed to extend specialty services to primary care physicians and their patients within RHP 9.

Rationale

As an academic medical center, UT Southwestern physicians provide innovative, patient-oriented medical services ranging from preventive care to world-class treatment in a wide variety of specialties, including cardiology, cardiothoracic surgery, cancer, heart and lung transplantation, neurosurgery, orthopaedic surgery, otolaryngology, obstetrics and gynecology, urology, breast surgery, vascular surgery, pediatrics, infectious disease, and much more. Moreover, UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided outpatient services to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inadequate access to efficient, quality specialty care services.

With the region standing at the forefront of Healthcare Reform, coupled with the downward pressure on service utilization, cost, and reimbursement – UT Southwestern sees the need to make investments in technology that supports expanded access to specialty services. As we build the UTSCAP Network and actively recruit community-based primary care physicians and their practices to join UT Southwestern faculty physicians, we must be prepared to provide these Network physicians and their patients efficient, cost-effective specialty care access and services. Being centrally located and faced with a population that has geographical, monetary, and other restrictions in accessing healthcare, UT Southwestern needs to develop outreach programs that share ownership of the results and bridge areas where patients may not engage on their own. Our Network community-based primary care physicians need to focus on primary care issues, with strong specialty support provided by Network specialists (UT Southwestern faculty physicians) via telemedicine services that create an environment of knowledge sharing.

This environment is necessary to evaluate patients efficiently, make only targeted referrals to specialists, and then appropriately transition these patients back to their primary care physician as soon as medically appropriate.

Delayed referral to and assessment by specialists creates a patient population with greater levels of healthcare status acuity and invites complications from co-morbidities. Improved and timely access to specialists will engage more physicians quicker while limiting face-to-face specialty visits except for those cases deemed necessary through the telemedicine consultation. Telemedicine services will also avoid the duplication of diagnostic efforts and decrease unnecessary hospital readmissions, as well as engaging patients in referrals, evaluation, treatment, and monitoring activities to keep health, condition stability, and outcomes optimal.

Project Components

To accomplish UTSW's ultimate goal of implementing a telemedicine program, UTSW's project includes the following core elements:

1) Complete a comprehensive evaluation of Telemedicine and Telehealth needs for the population, considering the technical, professional, education, and patient needs to reach project goals.

2) Develop the necessary Telemedicine infrastructure, training, education, and professional support needed to extend meaningful access and results.

3) Provide patient consultations by medical and surgical specialists as well as other types of health professionals using telecommunications. Determine candidates and deploy Telehealth technology to engage patients, promote Telemonitoring specific conditions, and

4) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.2-Regional Healthcare Infrastructure and Patient Migration Patterns

- CN.3-Healthcare Capacity
- CN.8-Specialty Care
- CN.12-Emergency Department Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative:

Given the challenges noted above, telemedicine has not been effectively deployed or available to the majority of the patient population in RHP9. UT Southwestern feels that by committing the resources contemplated in this project and deploying them into the community as described herein, the RHP9 delivery system will be enhanced. With the potential to reduce ER visits, urgent care visits, specialty visits, and facilitating early intervention, a properly implemented telemedicine program could be very impactful to RHP 9.

Related Category 3 Outcome Measure(s)

OD-1 Primary Care and Chronic Disease Management:

- IT-1.6 Cholesterol management for patients with cardiovascular conditions
- IT-1.7 Controlling high blood pressure
- IT-1.10 Diabetes care: HgbA1c poor control (>9.0%)

Reasons/rationale for selecting the outcome measures

The primary goal of this project is to transform the delivery of specialty care, which should result in better access and clinical outcomes for our patients. Of great concern in our region and nationally, is the prevalence of diabetes and heart disease. Thus, we chose IT-1.6, IT-1.7, and IT-1.10 for the outcome measures associated with this project. Improving access and ability to "reach out" to patients is a key ingredient to effecting the outcomes expected.

UTSW will be focusing on this outcome for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects

The success of this initiative is highly dependent on the implementation of the following other projects proposed by UT Southwestern: This project is tightly linked to the following RHP projects:

- ***126686802.2.2.2—Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement:***

- ***126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics:***

- ***126686802.2.1.1—Expanding Medical Home Model in the UTSCAP Primary Care Network:***

- ***126686802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.2.9.1—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

- ***126686802.2.12.1—Expanding Care Transition Programs:*** The development, implementation and evaluation under standardized protocols and evidence-based care delivery model through a network of post-acute care providers to improve the care delivered to people during transitions of care will rely heavily on robust population management infrastructure.

Relationship to Other Performing Providers' Projects in the RHP

Other projects in RHP 9 related to telemedicine/Telehealth include the following:

121988304.1.2	Lakes Regional MHMR (Behavioral Health)
020943901.1.1	Medical City Dallas Hospital – Stroke
020943901.1.2	Medical City Dallas Hospital – Behavioral Health

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criteria: 4.5 X 2 = 9**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criteria: 4.5 X 2 = 9**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criteria: 4.5 X 2 = 9**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criteria: 3.9 X 2 = 7.8**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 3.5 X 2 = 9

Total Valuation Score for this project: **8.7**

These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option 1.9.2 - UT Southwestern Clinical Center: **Establishing a New Community Specialty Care Outreach Center**

Unique Project ID: 126686802.1.5
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW")/126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy Hospitals and 40 clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s): This project establishes a new Specialty Care Clinic providing cardiology and other selected specialties to be determined based on demand.

Need for the Project: The Community Needs Assessment for RHP 9 identifies the lack in specialty care capacity, in addition high emergency department utilization for ambulatory conditions, to be areas of particular concern to the Region. UT Southwestern desires to reach out to the community by providing points of access throughout the community. Thus, this project will provide patients with a point of access to UT Southwestern that is in addition to UT Southwestern's main campus.

Target Population: The service area for the clinic is all people living within a 5-mile radius. Approximately 3% of our main campus outpatient population is either Medicaid eligible or indigent, so we expect an increase to 5% to benefit from this increased specialty care capacity. Low income population of service area zip codes ranges from 9% to 27%, with an average of 20%. Patterns of care and population movement suggest that 5% is a reasonable target for this new clinic.

Category 1 or 2 Expected Patient Benefits: The newly established specialty clinic seeks to provide 5,000 patient visits from a panel of 2,000 unique patients by DY5. Patient Visits are projected to grow from 2000 in DY2, 2750 in DY3, to 3500 in DY4, to 5000 in DY5. Unique patients are expected to grow from 500 in DY2, to 1,000 in DY3, 1,500 in DY4, and 2,000 in DY5. Based on demand, office hours are project to grow from an average of 40 hours per week in DY2, to 44 hours in DY3 and 48 hours in DY4.

Category 3 Outcome Measures:

- IT-1.6 Cholesterol Management—Our goal is to increase the number of patients with cardiovascular conditions that have a received an LDL-C test with a measurement of less than 100 mg/dL by X% (TBD) by DY5 over the DY2 baseline.

- IT-1.7 Controlling high blood pressure—Out goal is to increase the number of patients with hypertension whose most recent BP is adequately controlled by X% (TBD) by DY5 over the DY2 baseline.

Project Description

UT Southwestern Medical Center is in the process of establishing a new multispecialty clinic in Dallas County that is comprised of both Specialty Care and Primary Care Services.

This *proposal addresses solely the Specialty Care Clinic components*. The Specialty Care Clinic is planned to provide Cardiology and other selected specialties to be determined based on demand. When the new Clinic opens in January 2013, it will be staffed by at least one Cardiologist. As demand builds, additional specialists will be recruited to the clinic. The Specialty Care Clinic area will offer access to laboratory testing, cardiac stress testing, plain film x-rays and mammography.

The new clinic will have an electronic medical record that immediately will be integrated into the main UT Southwestern electronic medical record system. This will facilitate and increase access to other UT Southwestern specialists, clinics, and sophisticated diagnostic capabilities, as needed. Referrals within the system will be tracked.

The new clinic will require UT Southwestern to recruit additional physicians to the Faculty Practice Plan, which in turn will increase the capacity of UT Southwestern to see more patients. The new location, at Hillcrest Road and Northwest Highway, will make it easier for patients to access the new providers and services. In addition, once the new clinic reaches certain growth projections, evening and weekend hours are planned to further improve access to services.

By providing a new clinic in the Hillcrest/Northwest Highway area, UT Southwestern will be able to increase access to selected specialists at a location that is easier to find and navigate. Parking at the new location is free and easily accessible. Importantly, the location is also accessible by DART bus and train routes. Finally, increasing the number of specialty care providers will reduce the time it takes patients to obtain appointments, which can reduce the time to needed diagnosis and treatment.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

The goals of this project are as follows:

- Increase access to selected specialists at a location that is convenient to patients and located close to public transit;
- As demand grows, offer evening and weekend hours;
- Recruit new specialist physicians to practice within the new clinic location; and
- Increase the number of new patients accessing needed specialty care.

This project also meets the following regional goals

RHP 9 has identified capacity and access to appropriate, timely specialty care as one of the major issues facing the region. This project aims to address this issue by increasing access to specialty care and providing high quality, comprehensive specialty care collocated with primary care to patients in a less costly setting—an outpatient clinic. Emergency Department utilization and potentially preventable readmission rates are high in RHP 9. The project meets a regional goal of providing the right care, at the right time, in the right setting.

Challenges

New medical services in new locations face two substantive challenges. First, the community must be made aware of the new clinic and the types of physician services that are available. The second challenge is projecting the appropriate range and level of services to be provided based on demand/need assumptions. A marketing plan is being developed to announce the new Clinical Center that is designed to reach the community using web-based and print-based media targeted at service area referring physicians, households, and local newspapers. Based on the Community Needs Assessment, expanded cardiology services will be provided on a graduated basis and regulated by the response from the service area community. Other Internal Medicine sub-specialties will be evaluated based on patient feedback and community needs.

5-Year expected Outcomes for Provider and Patients:

Within the 5-Year period, we plan to have at least one full-time equivalent cardiologist, in addition to selected other specialists and sub-specialists as demand warrants. The service area for the clinic is all people living within a 5-mile radius. Approximately 3% of our main campus outpatient population is either Medicaid eligible or indigent, so we expect an increase to 5% to benefit from this increased specialty care capacity. Low income population of service area zip codes ranges from 9% to 27%, with an average of 20%. Patterns of care and population movement suggest that 5% is a reasonable target for this new clinic. The newly established specialty clinic seeks to provide 5,000 patient visits from a panel of 2,000 unique patients by DY5. Patient Visits are projected to grow from 2000 in DY2, 2750 in DY3, to 3500 in DY4, to 5000 in DY5. Unique patients are expected to grow from 500 in DY2, to 1,000 in DY3, 1,500 in DY4, and 2,000 in DY5. Based on demand, office hours are project to grow from an average of 40 hours per week in DY2, to 44 hours in DY3 and 48 hours in DY4.

Starting Point/Baseline

This new UTSW Clinical Center is in the fast-track design-build process. The specialty services, initially cardiology, are scheduled to become available in January 2013. Other specialties may be represented depending on demand. As a result of this being a new clinic, the **baseline is zero** for the number of clients served by the project. Projections targeting unique patients and patient visit volumes are still being developed.

The new specialty clinic will require UT Southwestern to recruit new physicians in Cardiology and selected other specialties, such as Oncology, depending upon demand. While we do not contemplate training residents at the new location during the first year, the clinic would provide an ideal setting to train medical students and residents in how to practice in a traditional community setting.

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 outpatient visits, of which 16,175 of these outpatient visits were specifically at UT Southwestern practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inadequate access to specialty care for the patients of RHP 9.

In addition, the RHP 9 Community Needs Assessment Report (April 2012) identifies increasing Primary Care and Specialty Care as first on their list of five priorities. More specifically, it states that "The demand for primary and specialty care services exceeds that of available medical physicians in these areas, thus limiting healthcare access for many low level management or specialized treatment for prevalent conditions. The top five prevalent conditions found in the Emergency Department are conditions that could be better managed in ambulatory clinics rather than hospital Emergency Departments.

In addition, the RHP 9 Community Needs Assessment Report notes that Dallas County has significant HPSA (Health Professions Shortage Areas) and MUA (Medically Underserved Areas). In order to expand capacity, more primary care and specialty care physicians need to be trained and/or recruited to Dallas County. At the same time, these providers need to be distributed more widely with the addition of new clinic sites to improve access by the targeted populations. The new Clinical Center is within commuting distance of several MUA-designated areas. The Community Needs Assessment addresses the need for more access to specialists but there are no designated geographic areas defined.

All patient populations have difficult gaining timely access to primary care physicians and specialists who provide care to patients with complicated or complex medical problems. This new clinic and the new providers address this challenge.

The new UT Southwestern Clinical Center represents a new initiative for UT Southwestern. The new clinic is part of an innovative strategy to create and operate multispecialty clinics away from the main campus. This will result in being able to provide expanded primary care services closer to the communities and populations that want and need improved access to UT Southwestern primary care physicians and specialists. The clinic will be located near several major highways and roads. It is also accessible by the DART System bus and train lines.

By providing a new clinic in the Hillcrest/Northwest Highway area, UT Southwestern will be able to expand primary care and increase access to selected specialists, as well as primary care physicians, at a location that is easier to find and navigate. Increasing the number of primary care providers will reduce the time it takes patients to obtain appointments, which can reduce the time to needed diagnosis and treatment. Furthermore, creating additional access away from the UT Southwestern Medical Center campus will relieve campus congestion and improve access primary care physicians, as well as improving access to the comprehensive spectrum of specialists and diagnostic services on the campus. Effectively, the new clinic improves access to primary care and specialty care in both the new clinic and to the existing clinics on the UT Southwestern campus.

Project components:

Through this project, we propose to meet all the required project components:

a) *Increase service availability with extended hours*

   Once the new clinic is established and growth projections are achieved, evening and weekend hours are planned.

b) *Increase number of specialty clinic locations*

   This project is selected because it will add a new specialty care clinic in the community, increase availability of Cardiology care providers and other selected specialists, improve access to specialty care.

c) *Implement transparent, standardized referrals across the system*

   UT Southwestern currently has the capability through its electronic medical record system. This system will be implemented in the new clinic.

d) Conduct quality improvement for the project using methods such as rapid cycle improvement (Shewhart Cycle: PDSA).

Community Needs Addressed

- CN.3-Healthcare Capacity
- CN.8-Specialty Care
- CN.9-Chronic Disease

- CN.12-Emergency Department Usage and Readmissions

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management:

- IT-1.6: Cholesterol Management (standalone measure)
- IT-1.7: Controlling high blood pressure (standalone measure)

Reasons/rationale for selecting the outcome measures:

The RHP 9 Community Needs Assessment Report (April 2012) identifies the top five prevalent conditions found in the Emergency Department encounters, which include hypertension and diabetes. These are conditions that could be better managed in the continuity of ambulatory clinic settings rather than episodic setting of hospital Emergency Departments. As part of a larger Chronic Disease Management strategy, monitoring indicators that will help prevent complications and slow the progress of the disease are high priorities.

In addition, the annual Behavioral Risk Factor Survey (BRFSS) is a valuable national source of ongoing data regarding the key risk factors for diabetes in Texans 18 years of age or older. High blood pressure, high blood cholesterol levels, and obesity are the top three risk factors associated with diabetes prevalence, heart disorders, and other conditions. Diabetes prevalence in Dallas County is significantly higher than the national average.

Relationship to other Projects

This project relates to all of the other proposed projects in terms of improving access, capacity and performance across all primary care settings. The specific projects include:

126686802.1.1.2 Expand Primary Care Capacity
126686802.1.1.4 Implement evidence-based projects to enhance primary care capacity
126686802.1.7.1 Implement telemedicine program
126686802.2.1.1 Development of PCMH standards
126686802.2.9.1 Develop patient navigation services

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

195018001.1.2 Baylor Medical Center at Carrollton (Trinity)
121790303.1.2 Baylor Medical Center at Garland
121776204.1.2 Baylor Medical Center at Irving
139485012.1.2 Baylor University Medical Center
127295703.1.5 Parkland Health & Hospital System

Learning Collaboratives: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain

additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criterion rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using the criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criteria: 6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criteria: 6**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criteria: 5.9**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criteria: 4**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criteria: 4**

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criteria: 5**

Total Valuation Score for this project: **5.5**

Project Option 1.10.2 - Implement UT Southwestern Population Management Infrastructure Development

RHP Project Identification Number: 126686802.1.6
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan /126686802

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s): This project will create a population management infrastructure that will enhance improvement capacity through technology, and allow the measuring, reporting and driving of quality improvement.

Need for the Project: UT Southwestern does not have the current technological capability for predictive modeling, patient risk stratification, or access to point-of-care tools. Thus, the ability to manage and track UTSCAP Network patient outcomes across the Network does not exists, resulting in an inability to provide the most efficient, quality care in the right setting at the right time.

Target Population: The target population for project is all patients seen within the UTSCAP Network (our patients). Approximately 3% of our patients are either Medicaid eligible or indigent, so we expect 3% to benefit from this increased primary care capacity.

Category 1 or 2 Expected Patient Benefits: The project seeks to increase collection of quality measure data, increase the number of reports generated through quality management data systems and increase the submission of quality dashboard/scorecards throughout UTSW by 10% in DY5 above the DY2 baseline. Patients are expected to benefit by reduced duplicative testing, reduced readmissions and better health via the project's systematic reporting of quality indicators. UTSW will substantially add to the number of patients in RHP 9 that have access to high quality, integrated care that has historically been unavailable. We anticipate by DY5 that approximately 277,000 covered lives, including 44,000 Medicaid/low income patients, will benefit from this program. We expect these patient populations to benefit from 1,100,000 patient contacts, including 178,000 Medicaid contacts, regarding their health and ways to improve their health as a result of the development and implementation of this program.

Category 3 Outcome Measures:

- IT-1.10 Diabetes Care: HbA1c— Out goal is to decrease the number of patients with diabetes who had a HbA1c greater than 9.0% by X% (TBD) by DY5 over the DY2 baseline.

- IT-12.1 Breast Cancer Screening—Our goal is to increase the number of women aged 40 to 69 that have received an annual mammogram by X% (TBD) by DY5 over the DY2 baseline.

- IT-12.3 Colorectal Cancer Screening—Out goal is to increase the number of adults aged 50 to 75 that have received colorectal cancer screening by X% (TBD) by DY5 over the DY2 baseline.

- IT-12.4 Pneumonia Vaccination Status of Older Adults—Out goal is to increase the number of patients who are older adults receiving a pneumonia vaccination by X% (TBD) by DY5 over the DY2 baseline.

Project Description

UT Southwestern proposes to create a population management infrastructure that will enhance improvement capacity through technology, allow the measuring, reporting and driving of quality improvement.

This population management infrastructure will be implemented in the UT Southwestern Clinical Affiliates Program (UTSCAP) Network. The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth. It is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term objectives for the Network include:

- Expanding access to primary care resources for RHP 9 patient population;
- Expanding, strengthening and implementing a clinically integrated network;
- Creating and implementing a quality care model that will most efficiently utilize finite primary care resources for patients of RHP 9;
- Developing an infrastructure for effective care coordination of Network patients;
- Enhancing and continually developing a clinically integrated organizational structure in preparation of health care reform and value-based reimbursement; and

Advancing the use of technology to improve health care and reduce medical errors.

This project will take critical steps towards linking existing silos of information to improve quality and efficiency. UT Southwestern will utilize innovative tools and programs to evaluate the use of resources, measure the value to patients, compare and contrast to other like providers, and attempt to eliminate wasteful spending.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

The goal of this project is to implement process improvement methodologies and systems to improve safety, quality, and efficiency. Through UT Southwestern's population management infrastructure investments, we intend to accomplish the following:

- Develop and implement a program of continuous improvement that will increase communication;
- Integrate system workflows;
- Provide actionable data to providers;
- Identify and attempt to reduce inefficiencies and waste;
- Facilitate the flow of patients and information;
- Enhance quality, drive down cost; and
- Identify and improve models of patient-centered care that address issues of safety, quality, and efficiency.

This project also meets the following regional goals:

A major goal of the region is to provide the right care, at the right time, in the right setting in an effort to reduce unnecessary emergency department and hospital utilization. This project would contribute to achieving that goal by providing Network physicians with the tools necessary to accomplish this goal. In addition, emergency department utilization is high in RHP 9 and by improving the quality of care patients receive through the Network, this project helps achieve the regional goal to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges

In today's healthcare environment there continues to be a serious lack of communication and electronic linkages amongst providers, a lack of quality performance data, infrequent data mining, and relatively little prospective analysis. Due to the costs associated with the

development of this infrastructure, the complexities associated with establishing these links, and the economic realities of healthcare, the provider community has historically not optimized investments in this type of infrastructure. As a result, the challenge for UT Southwestern will be developing an environment where providers recognize the benefits associated with population management infrastructure and embrace the required changes to improve the quality and cost efficiency for all patient populations.

UT Southwestern intends to overcome these obstacles by making the investments necessary to enhance provider connectivity. In fact, a pre-requisite of community-based primary care physicians to joining the UTSCAP Network is agreeing to electronically connect to UT Southwestern faculty physicians. As outlined in other UT Southwestern DSRIP projects, an important part of the solution will be to help offset the cost of these infrastructure investments.

5-Year expected outcomes for providers and patients

Through the implementation of this project, the 5-year expected outcomes include improved quality and adoption of efficiency principles, better analytic and forecasting capability, enhanced performance improvement capabilities, substantially improved quality data measurement, and improved physician reporting throughout the Network. The anticipated outcome for patients will be reduced duplicative testing, reduced readmissions, improved provider handoffs, and a higher compliance with evidence-based criteria. UTSW will substantially add to the number of patients in RHP 9 that have access to high quality, integrated care that has historically been unavailable. We anticipate by DY5 that approximately 277,000 covered lives, including 44,000 Medicaid/low income patients, will benefit from this program. We expect these patient populations to benefit from 1,100,000 patient contacts, including 178,000 Medicaid contacts, regarding their their health and ways to improve their health as a result of the development and implementation of this program.

Starting Point/Baseline

UT Southwestern has a robust electronic medical record system in both its inpatient and outpatient facilities. However, UT Southwestern does not have the current technological capability for predictive modeling, patient risk stratification, or access to point-of-care tools. In addition, for the UTSCAP Network clinics that are community based, despite having an electronic medical record, the ability to manage and track Network patient outcomes across the Network does not exist. Thus, the starting point for this initiative, prior to December 1, 2011, is zero (0).

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid

patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inefficient, ineffective care delivery.

UT Southwestern views performance improvement and reporting as foundational to the success of virtually all health reform initiatives. Quality health care is defined as "the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge." The development of capabilities contained in this project is critical for UT Southwestern to be able to implement process improvement methodologies across the UTSCAP Network to improve safety, quality and efficiency.

UT Southwestern selected this project because it is essential to improving the quality and cost efficiency of caring for our patient population. Without this infrastructure, expanding primary care would increase access but contribute to the inefficient use of resources. Expanding medical homes would be substantially less effective. Coordinating patient care for chronic care management would be nearly impossible. Reducing unnecessary referrals, admissions, readmissions, procedures, and testing would be substantially less effective. Communicating with other providers and coordinating patient care amongst other providers would be severely hampered, and aligning providers via a contracting strategy and quality incentive program would be impractical.

Processes that are inefficient and variable, changing case mix of patients, health insurance, differences in provider education and experience, and numerous other factors contribute to the complexity of health care. The aims of effectiveness and safety are targeted through process-of-care measures, assessing whether providers of health care perform processes that have been demonstrated to achieve the desired aims and avoid those processes that are predisposed toward harm. The goals of measuring health care quality are to determine the effects of health care on desired outcomes and to assess the degree to which health care adheres to processes based on scientific evidence or agreed to by professional consensus and is consistent with patient preferences.

Since errors are caused by system or process failures, it's important to implement various tools and programs to identify inefficiencies, ineffective care, and preventable errors to then influence changes in care processes. Each of these techniques involves assessing performance and using findings to inform change.

Project components

To accomplish UT Southwestern's ultimate goal of implementing process improvement methodologies and systems to improve safety, quality, and efficiency, this project includes the following core elements:

1) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture,
2) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement, and
3) Design data collection systems to collect real-time data that is used to drive continuous quality improvement.

UT Southwestern has selected a number of milestones and metrics that are relevant to the community needs and priorities of RHP 9.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.2-Regional Healthcare Infrastructure and Patient migration Patterns
- CN.9-Chronic Disease
- CN.11-Patient Safety and Quality
- CN.12-ED Usage and Readmissions

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative

We think this will represent a substantial enhancement over the current delivery system by helping the UTSCAP Network of care teams actively manage patients with targeted chronic conditions, which should improve rates of preventive care. Having the functionality in as many sites as possible will enable care coordination for patients as they access various services throughout the system. These enhancements will allow the Network to better target clinical conditions/diseases most pertinent to the RHP 9 patient population (e.g., diabetes, hypertension, chronic heart failure).

Related Category 3 Outcome Measure(s)

OD-1 Primary Care and Chronic Disease Management

- IT-1.10 Diabetes Care: HbA1c poor control (>9.0%)

OD-12 Primary Care and Primary Prevention Outcomes:

- IT-12.1 Breast Cancer Screening (HEDIS 2012)
- IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
- IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Reasons/rationale for selecting the outcome measures

Our development and implementation of a population management infrastructure available throughout the UTSCAP Network is aimed at increasing the likelihood of desired health outcomes. We selected the above outcomes because measuring, reporting and acting upon quality improvement measures for primary care should result in the increased incidence of preventative services actually delivered to patients. We subscribe to the theory that screening programs should lead to a cost-effective reduction in disease burden. UT Southwestern will focus on these outcomes for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

In addition, we selected the outcome measure of HbA1c because diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. RHP 9 has similar opportunity to benefit from improvements in identifying and managing patients with this condition.

While the ultimate goal of this initiative is implementing process improvement methodologies and systems to improve safety, quality, and efficiency, we selected diabetes care as our outcome measure because of the prevalence of diabetes in our region. UT Southwestern will be focusing on this outcome for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on this outcome will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects

The success of this initiative is highly dependent on the implementation of a number of other UT Southwestern DSRIP Projects. Likewise, developing this foundation will be critical to the success of most of the other projects included in the UT Southwestern RHP program. The success of this project is highly dependent on the implementation of the following other projects proposed by UT Southwestern:

- ***126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics***

- ***126686802.1.1.4—Implement a Quality Incentive Program for Network Primary Care Providers***

- ***126686802.2.1.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network:***

- ***126686802.2.9.1—Implement/Expand Care Coordination Programs***

- ***126686802.2.12.1—Expanding Care Transition Programs***

Relationship to Other Performing Providers' Projects

Parkland Health & Hospital System has a related project for performance improvement (127295703.1.4)

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the criteria listed below as being most significant to differentiate between projects. Second, we began with a 5-point scale for each criterion rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using the criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 3.5 X 2 = 7

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 3.5 X 2 = 7

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criteria: 2.5 X 2 = 5**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criteria: 3.5 X 2 = 7**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 3.5 X 2 = 7

Total Valuation Score for this project: **6.5**

These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option: 1.2.1 – Update primary care training programs to include training on the medical home and chronic care models, disease registry use for population management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement.
Title of Project: UT Southwestern Office of CME Initiative: Increasing CME Training of Primary Care Physicians
RHP Project Identification Number: 126686802.1.7 (Pass 2)
Performing Provider Name/TPI: UT Southwestern Medical Center/ TPI 126686802

Summary Information
Summary Description: UT Southwestern Medical Center (UTSW) proposes to develop a significant number of CME and MOC courses for primary care physicians and supporting clinical professionals across the region to better prepare them for participation in DSRIP Program projects. The course topics would include Patient-Centered Medical Home, Chronic Disease Management, Culturally Competent Care, using Telemedicine to improve their practice, Practice Performance Improvement, Medication Management, Disease Prevention, and other topics relevant to the RHP Community Needs Assessment.

Intervention: UTSW Office of CME will significant expand the volume of continuing medical education offerings with relevant DSRIP topic content targeted to primary care providers in the Region, particularly providers providing services to Medicaid and low-income populations. In addition, the CME will be offered in a variety of modalities, from live conferences and symposia, grand rounds, and live webinars, to on-demand on-line webinars and on-line courses, as well as on-site hands-on training and consultations. CME is the ideal opportunity to provide training and education because it is a basic, conditioned obligation of all providers to maintain their license to practice.

Need for project: A great many behavior change and practice pattern alterations are being asked of the primary care providers in Region 9. The many project options and suggested milestones/metrics will require knowledge and skills that generally are not present in the primary care providers at sufficient levels to allow for success of the delivery system reform goals. Adult behavior change at the proposed magnitude suggested in the DSRIP Program necessitates someone providing the requisite education and training opportunities to the entire population of providers in the Region.

Target Population: According to data from The Texas Department of State Health Services, there are 2,512 primary care physicians in Region 9. We are focusing on all primary care providers in the Region, particularly those who serve Medicaid and low-income populations. 24% of physicians in Dallas County accept all Medicaid patients who present, while 21% only accept a limited number. 44% of physicians do not accept Medicaid. All primary care providers will benefit from the targeted CME and MOC programs focusing on the targeted topics.

Category 1 and 2 Expected Benefits: At least 22 new CME programs will be developed across multiple modalities for the 2,512 primary care physicians and approximately 10,000 clinical

professionals who support their patients within the Region, which are affordable and more accessible. The number of attendees for all modalities could easily approach 25,000 by DY5. The new programs will provide a convenient platform for providers to acquire the knowledge and skills to adapt and thrive in the delivery system reform programs being mandated across the Region and Texas, particularly those service Medicaid and low income populations.

Category 3 Outcomes: OD-1: Primary Care and Chronic Disease Management,
IT-1.20: Educated Primary Care Workforce.

Project Description:

UT Southwestern Medical Center (UTSW) proposes to develop a significant number of CME courses for primary care physicians across the region to better prepare them for participation in DSRIP Program projects. The course topics would include Patient-Centered Medical Home, Chronic Disease Management, Culturally Competent Care, using Telemedicine to improve their practice, Practice Performance Improvement, Medication Management, Disease Prevention, and other topics relevant to the RHP Community Needs Assessment. The UTSW Office of CME and Public Education at UT Southwestern Medical Center currently provides a wide range of CME to all physician specialties. Physicians across the region can access educational programs through attendance at Ground Rounds, live conferences and symposia, live webinars, on-demand webinars, on-demand on-line programs. The expansion of the CME programs will include in-office, on-site education programs and consultations. A particular focus for promoting and offering relevant programs will be to providers and their staff who treat Medicaid and low-income patients, particularly if they are in HPSAs and MUAs.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals of the Project and Relationship to Regional Goals:

The goal of expanding the type and accessibility of CME programs to primary care providers, particularly those who deal with Medicaid and low-income populations, is to prepare them to understand, implement, and participate in the delivery system reform initiatives that will improve care to the target populations, reduce costs, and improve outcomes. With adequate education, understanding, and preparation, primary care providers will be much more likely to embrace the kinds of behavior and practice changes that are fundamental to transforming how the deliver services to their patients. Absent adequate knowledge and skills, basic acceptance of proposed delivery system changes and the likely level of success will be inadequate to achieve the goals of the 1115 Waiver and Transformation initiatives. Regional goals across Texas propose to achieve substantive improvements in many areas. There is nothing in the Community Needs Assessments that propose to prepare providers to make the many significant reforms expected of them. This project proposes to remedy that gap by offering accessible and affordable CME, in many different ways, to improve provider understanding, acceptance, and ability to implement the proposed reforms.

Challenges:

Many studies have look how difficult it is to change behavior in adults. The DSRIP Program's goals set challenging timeframes to achieve behavior change and to measurably impact the costs of care and the outcomes of transformed services. The challenge will be providing sufficient educational resources in a timely manner to prepare enough primary care providers across the region to be successful in reforming how they deliver care. To meet that challenge, the UTSW Office of CME will offer an expanded menu of course content relevant to the Region's goals. UTSW will offer CME in a variety of ways to make it affordable and more accessible to all primary care providers regardless of the schedules and busy practices. The courses will be offered through live conferences, webinars, on-demand on-line programs, and in-office consultations for hands-on education.

5-Year Expected Outcomes for Provider and Patients:

By the end of DY5, there will be a significant increase in the knowledge and skills of the primary care provider workforce across the Region as demonstrated in pre-CME and post-CME evaluations. This project will support almost all regional goals by insuring that primary care providers have acquired the knowledge and skills to accommodate the behavioral changes needed to transform their delivery behaviors. According to data from The Texas Department of State Health Services, there are 2,512 primary care physicians in Region 9. The DY2 will determine how much education is taking place among the Region's primary care providers relevant to the region's goals. The planned outcome is to have the region's primary care providers participating in relevant CME programs of one kind or another, with demonstrated improvements in knowledge and skills. New courses will be added to address the particular needs of healthcare transformation in RHP 9: 4 new courses in DY2, 6 new courses in DY3, 6 more new courses in DY4 and DY5, for a total increase of 22 new courses. It is important to note that members of the primary care provider team, including physicians, mid-level providers, nurses, physical therapists, and other, particularly if they serve Medicaid and low income populations, have the biggest challenge affording the expense and the time to attend CME and MOC programs. The project will have a substantial focus on developing CME and MOC opportunities for webinars, on-demand courses, and long distance options at lower cost than live seminars and conferences. While CME is only one factor in transforming the Region's delivery system, it is an essential one. PCPs who are now or who will be caring for Medicaid patients desperately need the skills and knowledge offered by these new programs. Medicaid patients will benefit from their providers knowing how to better manage their health problems. For patients, the outcomes will be reflected in the progress that primary care providers have made due to their acquired knowledge and skills.

Starting Point/Baseline:

During the first year of the project (DY2), UTSW hired a new AVP for the Office of Continuing Medical Education. UTSW will conduct surveys to determine the extent to which the Region's primary care providers are participating in CME and MOC relevant to the identified needs providing primary care providers in the community with the knowledge and skills related to developing and participating in patient-centered medical homes and chronic care models, disease registry use for population management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement. The results of this

survey will establish the baseline of participation and course content. The results also will help determine the resources that will be needed to improve the understanding and skills of primary care providers through expanding courses offerings and means of accessing them. At least 22 new courses will be developed beginning in DY2 and expanded through DY5 based on need and demand.

Rationale:

The Community Needs Assessment and the Project Options address the shortage of primary care providers and the need to train more of them. Many of the projects address the need to plan, develop and implement a dizzying array of new initiatives. All of these documents appear to assume that the providers and their staffs already have the knowledge and skills to carry out the new initiatives OR that all of these implementation plans include training and orientation of the existing provider population. The literature abounds with articles, studies and research outcomes showing the lack of understanding for how to carry out many of the new delivery system tactics. There is ample research to show that adult behavior change takes time, training, education and reinforcement to be successful. Most Performing Providers have some degree of internal resources that provide orientation, training and continuing education for their employees. The educational content that they offer is what they have correctly determined is the minimum requirements for their respective organizations to be successful. Very few of these organizations have the resources to add significant new content. More importantly, most of the primary care providers dealing with the Medicaid and low-income populations practice outside the walls of the Performing Providers. How, then, will the Region educate, train, and guide community primary care providers in gaining the knowledge and skills needed to participate in such initiatives as Patient-Centered Medical Home, Chronic Disease Management on a population-based model, and Care Coordination across multiple levels of care delivery? The opportunity lies in the hours of continuing medical education that all primary care providers are required to obtain as a requirement of their licensure. CME is not an optional exercise. It makes sense to offer CME that will both meet the requirements of licensure, as well as meet the needs of the healthcare reform imperatives engraved in the Delivery System Reform Incentive Payment Program. UT Southwestern's Office of CME has the leadership, skills, and resources to expand their current scope of educational program content to help prepare primary care providers, in the Region 9 and beyond, for the necessary behavior and practice changes.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

UT Southwestern already has an Office of CME and Public Education that provides education services. However, the programs and resources are primarily focused on meeting the needs of the UT Southwestern faculty, residents, fellows, medical school and allied health school students. Meeting the needs of community primary care physicians and other providers on the primary care team is an important but secondary focus. The project proposes to expand their focus on primary care providers with a significant expansion of the number of educational offerings with new content addressing the topics essential to the success of the DSRIP Program.

Community Needs Addressed:

Two of the five priorities identified in the RHP 9 Community Needs Assessment are Primary Care Capacity and Chronic Disease Management. The Community Needs specifically addressed by the project, due to the nature of continuing medical education, include:

CN.3 Healthcare Capacity
CN.4 Primary Care
CN.6 Behavioral Health and Primary Care
CN.8 Chronic Disease
CN.11 Patient Safety and Quality
CN.12 Emergency Department Usage and Readmissions
CN.13 Palliative Care

Projects being proposed across RHP 9 include developing or expanding use of the Patient-Centered Medical Home and developing or expanding use of various Chronic Disease Management approaches. These and other projects will require additional knowledge and skills, along with changes to how physician practices are managed. Evidenced-based education and the resultant behavior changes are a significant undertaking. At the same time, if we don't educate and train existing primary care workforces, our ability to implement innovative PCMH and Chronic Disease Management programs will be severely limited. Targeted CME programs will improve the value of the current primary care workforce while we are also working to expand that workforce.

Related Category 3 Outcome Measure(s):

OD-1: Primary Care and Chronic Disease Management

- **Measure IT-1.20: Educated Primary Care Workforce (standalone measure)**

This custom Category 3 Outcome Measure is important to the success of all projects relating to Primary Care and Chronic Disease Management, both of which a in the five priorities listed in the RHP 9 Community Needs Assessment. In order to transform the healthcare delivery system, Performing Providers must prepare, educate and train the existing primary care workforce. The training must be targeted in new areas of continuing medical education. The critical outcome is the demonstration of data that shows the workforce has increased the knowledge and understanding of how to carry out the priority projects identified in the RHP Planning Protocol, which includes understanding and implementing medical home models and chronic disease management models, and other topics important to the RHP. The Category 1 project of developing and providing CME programs with many alternative delivery methods is an essential tool for preparing the workforce and implementing the programs. There is ample evidence showing that the use of appropriate adult education techniques improves the learning and application of new information that can transform how primary care providers deliver care.

Relationship to other Projects:

This project is directly related to the following projects because this project provides the education and training that will assist primary care providers to understand and support implementation of them:

- 126686802.1.2 Expand Primary Care Capacity
- 126686802.1.4 Develop Telemedicine
- 126686802.1.6 Develop Population Management Infrastructure
- 126686802.1.8 Implementing Family Medicine Residency Courses in PCMH, CDM
- 126686802.1.10 Training Community Health Workers
- 126686802.2.1 Enhance/expand Medical Homes
- 126686802.2.2 Apply Process Improvement Methodology
- 126686802.2.4 Establish/Expand a Patient Navigation Program
- 126686802.2.5 Implement/Expand Care Transition Program
- 126686802.2.11 Conduct Medication Management

Relationship to Other Performing Providers' Projects in the RHP: No other project in RHP 9 proposes to provide education and training through CME to community primary care providers.

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-

point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criterion:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criterion: 7.00

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criterion: 6.00

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criterion: 6.90

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criterion: 4.95

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criterion: 4.50

Total Valuation Score for this project: **5.70**

❖ This project is not funded through collaboration funding.

Project Option: 1.2.1 - UT Southwestern Family Residency Program – Training Family Medicine Residents in Patient-Centered Medical Home and Chronic Disease Management

Unique Project ID: 126686802.1.8 (Pass 2)
Performing Provider Name/TPI: UT Southwestern Medical Center, TPI 126686802

Summary Information

Summary Description**:** This project will expand Family Medicine Residency training program classes to include training on the medical home, chronic care models, disease registry use, patient panel management, and other identified training needs and/or quality/performance improvement so when Residents graduate, they can join practices with those functions or they can initiate the practices in their new settings. The UTSW Family Medicine Residency Program residents gain most of their clinical experience during the training at the Parkland Memorial Hospital Family Medicine Clinic. That Clinic plans to implement the patient-centered medical home and other innovative concepts in the future. UTSW Residents will be pre-trained to help meet the goals of the Parkland Clinic.

Provider*:* The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 3% of UTSW patient visits was attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention: To better prepare Family Medicine Residents to implement or participate in practice patterns and practice behaviors that will help continue healthcare delivery system reform, they will be provided education and training during their 3-year program that will prepare them to participate in the changes required or that are being implemented.

Need for Project: The RHP 9 Community Needs Assessment clearly identifies the shortage of primary care physicians and the need to implement programs such as patient-centered medical home in order to improve services, improve outcomes, and reduce costs of care to the people living in the Region.

Target Population: The UTSW Family Medicine Residency Program currently has 28 trainees across the three class graduation years. That number is projected to grow to 36 trainees. Information is critical to the future success of residents entering community practice. These physicians only treat Medicaid and low income patients during their Residency, seeing an estimated 20,000 patient visits annually.

Category 1 Expected Patient Benefits: The goal is to graduate Family Medicine physicians who are already trained and committed to applying the principles of patient centered medical home, chronic disease management and population management to Medicaid and low income populations.

Category 3 Outcomes:

OD-14: Outcomes for Workforce Projects

IT-14.1: Number of primary care practitioners per 1000 individuals in HPSAs or MUAs

Project Description:

This project will update Family Medicine Residency training program classes to include training on the medical home, chronic care models, disease registry use for population health management, patient panel management, and other identified training needs and/or quality/performance improvement so when Residents graduate, they can join practices with those functions or they can initiate the practices in their new settings. The UTSW Family Medicine Residency Program residents gain most of their clinical experience during the training at the Parkland Memorial Hospital Family Medicine Clinic. That Clinic plans to implement the patient-centered medical home and other innovative concepts in the future. UTSW Residents will be pre-trained to help meet the goals of the Parkland Clinic.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

The goal of the project is to educate all Family Medicine Residency faculty and residents in the principles and applications of initiatives such as patient centered medical home, chronic disease management, disease registry use for population health management, patient panel management, and other identified training needs and in principles of quality/performance improvement.

Region 9 priorities include improving primary care physician supply and capacity, improved care coordination, improved patient safety and quality. In order to achieve these goals, the practicing physician community needs to be increased. In addition, the practicing physicians must be made more knowledgeable and skills in implementing, participating in, and managing the various initiatives that will help Region 9 improve the delivery of services, improve outcomes and reduce the costs of care for all populations, but particularly Medicaid and low-income patients. By providing the requisite knowledge and skills to Family Medicine residents, they will be able to integrate into community practice setting more quickly. They also will be able to help implement and manage the desired initiatives more readily.

Challenges:

The demands on faculty to provide adequate, comprehensive education and training to residents are significant. There are many requirements that faculty leadership must meet in

developing the curriculum and assuring competency. The challenge will be the addition of more information to learn about different topics and skills to acquire that residents can then apply during the clinical training experiences and after graduation. The Family Medicine Residency faculty will develop a plan and implement teaching methods that will impart the desired knowledge and skills.

5-Year Expected Outcome for Providers and Patients:
The UTSW Family Medicine Residency Program currently has 28 trainees across the three class graduation years. That number is projected to grow to 36 trainees. Information is critical to the future success of residents entering community practice. These physicians only treat Medicaid and low income patients during their Residency, seeing an estimated 20,000 patient visits annually. By DY5, the Family Residency program will train up to 6 faculty and will graduate up to 36 family medicine physicians. The goal is to graduate Family Medicine physicians who are already trained and committed to applying the principles of patient centered medical home, chronic disease management and population management to Medicaid and low income populations and who will hopefully remain in the Dallas area and join practices that provide services to Medicaid and low-income patients.

Starting Point/Baseline:
The baseline is effectively zero because the Family Medicine Residency Program does not teach the specified course content.

Rationale:
Two of the five priorities identified in the RHP 9 Community Needs Assessment are Primary Care Capacity and Chronic Disease Management. This project addresses the needs of the region by training and motivating future family medicine physicians to understand, accept, and become committed to participating in initiatives that will benefit the target populations. Having applied their new knowledge and skills in a Medicaid clinic, it is hoped that the resident will be more likely to remain the RHP 9 and continue to serve Medicaid and low-income patients.

Texas has a growing shortage of primary care doctors and nurses due to the needs of an aging population, a decline in the number of medical students choosing primary care, and thousands of aging baby boomers who are doctors and nurses looking towards retirement. The shortage of primary care workforce personnel in Texas is a critical problem that we have the opportunity to begin addressing under this waiver. It is difficult to recruit and hire primary care physicians. The shortage of primary care providers has contributed to increased wait times in hospitals, community clinics, and other care settings. Expanding the primary care workforce will increase access and capacity and help create an organized structure of primary care providers, clinicians, and staff. Moreover, this expansion will strengthen an integrated health care system and play a key role in implementing disease management programs. The extended primary care workforce will also be trained to operate in patient-centered medical homes. A greater focus on primary care will be crucial to the success of an integrated health care system. Furthermore, in order to effectively operate in a medical home model, there is a need for residency and training

programs to expand the capabilities of primary care providers and other staff to effectively provide team-based care and manage population health. Therefore, the need to expand the responsibilities of primary care workforce members will be even more important. In summary, the goal for this project is to train more workforce members to serve as primary care providers, clinicians, and staff to help address the substantial primary care workforce shortage and to update training programs to include more organized care delivery models. This project may apply to primary care physicians (including residents in training), nurse practitioners, physician assistants, and other clinicians/staff (e.g., health coaches, community health workers/promotoras) in the following service areas: family medicine, internal medicine, obstetrics and gynecology, geriatrics, and pediatrics.

In 2010, Texas had 176 patient care physicians per 100,000 population and 70 primary care physicians per 100,000 population with a state ranking of 46 and 47, respectively. (Comparable ratios for US Total are 219.5 and 90.5, respectively.) From 2001 to 2011, the Texas physician workforce grew 32.3%, exceeding the population growth of 25.1%. Primary care physician workforce grew only 25% in the same period. From 2002 to 2011, Texas increased medical school enrollment 31% from 1,342 to 1,762 in line with the national call by the Association of American Medical Colleges to increase medical school enrollments by 30%. In 2011, there were 1,445 medical school graduates. Coincidentally, there were 1,445 allopathic entry-level GME positions offered in the annual National Resident Matching program. (There were 31 osteopathic slots.) The Texas Higher Education Coordinating Board recommends a ratio of 1.1 entry-level GME positions for each Texas medical school graduate. The number of Texas medical school graduates is expected to peak at over 1,700 in 2015. This implies a need for 400 additional GME positions by 2015. The shortage of GME positions or residency slots may be the single most problematic bottleneck in Texas' efforts to alleviate the state's physician shortage.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project is a new initiative within the Family Medicine Residency Program. However, it complements other initiatives by the UTSW Faculty Practice Plan and the UTSW Clinical Affiliates Program. Taken together, all of these efforts will strongly support the goals of RHP 9.

This project addresses the needs of the region by training and motivating future family medicine physicians to understand, accept, and become committed to participating in initiatives that will benefit the target populations. Having applied their new knowledge and skills in a Medicaid clinic, it is hoped that the resident will be more likely to remain the RHP 9 and continue to serve Medicaid and low-income patients.

Community Needs Addressed:

The Community Needs Assessment specifically addressed by the project include:

- CN.3 Healthcare Capacity
- CN.4 Primary Care and Pediatrics
- CN.8 Chronic Disease
- CN.11 Patient Safety and Quality

CN.12 Emergency Department Usage and Readmissions

Projects being proposed across RHP 9 include developing or expanding use of the Patient-Centered Medical Home and developing or expanding use of various Chronic Disease Management approaches. These and other projects will require additional knowledge and skills, along with changes to how physician practices are managed. Evidenced-based education and the resultant behavior changes are a significant undertaking. At the same time, if we don't educate and train existing primary care workforces, our ability to implement innovative PCMH and Chronic Disease Management programs will be severely limited. UT Southwestern has a well-established Office of CME that understands how to educate providers so that they can better absorb and adopt new processes, protocols, and performance improving techniques. Targeted CME programs will improve the value of the current primary care workforce while we are also working to expand that workforce.

The variety of methods for providing CME allow physicians to schedule their learning opportunities when it is most convenient and effective for their practice schedules. Many methods also offer cost-effective ways to reach larger populations of providers regardless of where they are located.

Related Category 3 Outcome Measure(s):

OD-14: Outcomes for Workforce Projects

IT-14.1: Number of primary care practitioners per 1000 individuals in HPSAs or MUAs

This measure reflects the need to increase the number of primary care practitioners caring for the target populations, especially if they have the skills needed in an ear of healthcare reform and transformation.

Relationship to other Projects:

This project is directly related to the following projects because this project provides the education and training that will assist newly graduated primary care providers to understand and support implementation of them:

- 126686802.1.1 Establish a New Primary Care Clinic
- 126686802.1.2 Expand Primary Care Capacity in the UTSCAP Network
- 126686802.1.7 Expand CME Courses to Train Primary Care Providers
- 126686802.1.10 Implement a Population Management Infrastructure
- 126686802.2.6 Conduct Medication Management

Relationship to Other Performing Providers' Projects in the RHP: No other project in RHP 9 proposes to provide education and training to Family Medicine residents.

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 4.00

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 4.00

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 3.00

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 4.35

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 5.00

Total Valuation Score for this project: **3.80**

Project Option: 1.2.2 – Increase the number of Primary Care Providers
Title of Project: Increasing Access to Primary Care: The Expansion and Redesign of the UT Southwestern Physician Assistant Program

RHP Project Identification Number: 126686802.1.9 (Pass 2)
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") / TPI 126686802

Summary Information:
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 24% of UTSW patient visits was attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): UTSW will increase the class enrollment size and the redesign the curriculum of the UT Southwestern Physician Assistant ("PA") program (including reducing the time to graduation) in our effort to address the shortage of primary care providers and foster an interest in primary care as a specialty for PA trainees.

Need for the Project: In order to address the demand for primary care services in our Region, UT Southwestern proposes a comprehensive project to increase the production of PA's in the Region who are life-long learners, with substantial clinical knowledge, coupled with culturally sensitive abilities that are able to meet the needs of a demographically changing patient population.

Target Population: Students and graduates of the UTSW Physician Assistant program are the primary target population. By enhancing their education and training with skills appropriate to healthcare reform and treating Medicaid and low income populations, it is expected that they will more likely seek where the ultimate target population is served.

Category 1 or 2 Expected Patient Benefits: Increasing the annual class size from 36 to 60 students, and streamlining the curriculum of the PA Program, will result in almost doubling the available providers to the Region. New efforts will be made to increase the number of PA graduates that work in primary care and with underserved populations. The new graduates will have enhanced knowledge and skills in topics essential to healthcare reform and transformation success. The value of each additional primary care practitioners is an average of 1500-2000 unique patients and as many 5,000 patient visits per year per new provider.

Category 3 Outcome Measures:

OD-14 – Outcomes for Workforce Projects

IT-14.2 – Number of practicing nurse practitioners and physician assistants per 1000 individuals in HPSAs or MUAs

Project Description:

UT Southwestern proposes to increase the class enrollment size and the redesign the curriculum of the UT Southwestern Physician Assistant ("PA") program.

This expansion of the program plays an important role in our Region's effort to increase access and capacity in primary care. To accomplish the expansion of the PA Program, UT Southwestern proposes to 1) reduce the time-to-degree from the current 30 months to 24 months, thus enabling a more nimble response to health workforce needs; 2) incrementally increase annual student enrollment from the baseline of 36 to a goal of 60 students per enrollment year (60% increase); 3) add additional on-campus and external/off-campus resources for clinical and teaching experiences, and 4) increase the number of PA faculty available for the curriculum's required small group teaching in the program's first year.

However, expansion alone is not enough in our efforts to produce additional primary care providers in our Region and in Texas. Thus, UT Southwestern also proposes to foster an interest in primary care as a specialty for PA trainees and build on a team-based approach to healthcare that recognizes and appreciates the role of PA's at UT Southwestern.

Collaboration

This project is being proposed through a collaboration agreement. The specific collaboration arrangement for this project is set forth below.

Collaborators	DY2	DY3	DY4	DY5	Total
Parkland Memorial Hospital	513,723	702,925	860,336	1,021,564	3,098,548

Total Project Value	**1,192,876**	**1,458,046**	**1,572,701**	**1,524,584**	**5,748,201**

The collaboration involves the transfer of Pass 2 allocated dollars from Parkland Memorial Hospital (public entity) to the performing provider (public entity). The combined project value for this project exceeds the funding provided by the collaborating entity.

The collaborating parties have joined together in this collaboration with the belief that the goals of this project are valuable and will contribute to regional transformation. This project will intersect with the Parkland Project 127295703.2.11 to enhance/expand the medical home model for the family medicine clinic associated with this training initiative.

Goals and Relationship to Regional Goals:

The primary goal of this project is to increase the primary care capacity within our Region and Texas. Specifically, the project goals are as follows:

- Streamline the curriculum by concentrating content from 30 to 24 months;
- Increase the number of PA trainees enrolled at UT Southwestern;
- Foster and develop an interest in primary care by UT Southwestern PA trainees; and
- Develop, reinforce and build on a culture of health care delivery through a team approach that utilizes PA's at UT Southwestern.

This project also meets the Regional goal of increasing the primary care capacity and reducing the shortage of primary care providers in our Region.

Challenges:

Our PA Program faces the following challenges in training PA's for a career in primary care. First, the current clinical environment and culture at UT Southwestern does not maximize the use of PA's in the delivery of primary care services. Despite a forty-year campus presence, the acceptance and ideal utilization of PA's as non-physician clinicians has not been consistent over time; thus, there is less opportunity for clinical utilization role-modeling and professional socialization for the trainees. Second, PA's have opportunities to practice in varying specialties that generally provide greater salaries than primary care practice. For example, the 2010 census by the American Academy of Physician Assistants, thirty-one (31) percent of PA's primary specialty is in primary care and the median annual compensation is the lowest in this specialty. However, with renewed support and a desire to build on a culture of providing health care through a team-based approach at UT Southwestern and the support of our Regional Partners' for clinical rotations in primary care settings, the project will be successful.

5-Year Expected Outcome for Provider and Patients:

The 5-year expected outcome for patients in our Region is an increase in the number of students enrolled in its PA Program by 60%, from a baseline of 36 to a first year enrollment of 60 students by DY5. This increase in class size will result in the production of an additional 70 PAs available to practice in our Region by DY5. Increasing the annual class size and streamlining the curriculum of the PA Program, resulting in an increase in available primary care providers to the Region, will serve the patients throughout our Region in need of primary care services and support the mission of UT Southwestern to educate future health care providers. In addition, UT Southwestern expects to increase the PA program's focus on innovative primary care models in its curriculum through the exposure of trainees to the patient centered medical home model and participation of trainees in quality improvement projects, all while building on a team-based approach to healthcare at UT Southwestern. The value of each additional primary care practitioners is an average of 1500-2000 unique patients and as many 5,000 patient visits per year per new provider.

Starting Point/Baseline:

As of December 1, 2011, one thousand one hundred forty-five (1,145) applicants applied to the Program for filling the class size of thirty-six (36) students. The 2011 class includes 6 educationally disadvantaged, 1 economically disadvantaged, 3 under-represented minority, 2 other minority students. The faculty consists of 6.5 full time equivalent (FTE) faculty members. The program is currently a 30-month full-time master's degree program, which is a rapid approach to addressing the primary care provider shortage. The curriculum is divided into a 15-month didactic phase followed by a fifteen-month clinical phase. With a current instructional faculty complement of 6.5 FTE and an annualized enrollment of 96 students, our student-to-faculty ratio is 14.8:1, compared to the U.S. mean student/faculty ratio is 14.3:1.

The UT Southwestern PA Program commenced in 1972 with six students, and by 2011 the Program had 1,000 graduates, over 70% of who are licensed to practice in Texas. This PA Program is one of the most academically successful in the U.S., having achieved a five-year first-time pass rate on the Physician Assistant National Certifying Examination of 100%, one of only five (out of 164) programs in the country able to make this claim. It is currently ranked 8th nationally by U.S. News & World Report. The program has earned lengthy periods of continuing accreditation from the Accreditation Review Commission on Education for the Physician Assistant, Inc., and is now on a second consecutive cycle of seven years accreditation, the maximum granted length.

Rationale:

In order to address the demand for primary care services in our Region, UT Southwestern proposes a comprehensive project to increase the production of PA's in the Region who are life-long learners, with substantial clinical knowledge, coupled with culturally sensitive abilities that are able to meet the needs of a demographically changing patient population. Although not every PA trained at UT Southwestern stays within the Region, a majority stay within North Texas. The demand for primary care services in our Region is a current demand, and the time required to produce one licensed primary care physician is approximately seven to eight years. The time required to produce one licensed primary care physician assistant is approximately three years.

In the face of an immediate challenge by the current and expected future shortage of primary care physicians, the expansion of Medicaid, and the important role PA's play in the delivery of primary care services, expanding the UT Southwestern PA program is a sound approach to producing more primary care providers in a relatively short time period. In addition to increasing class size of the PA Program, UT Southwestern is also aware of the need to develop and maintain an interest in primary care service for its trainees.

Thus, UT Southwestern will not only increase the enrollment size of the PA Program, but it will also foster an interest in primary care through the following selected milestones:

- Expand positive primary care exposure for PA trainees through an expansion of primary care clinical rotations;

- Train PA trainees in the patient centered medical home model; and

- Include PA trainees/rotations in quality improvement projects.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The UT Southwestern PA Program is currently a 30-month full-time master's degree program with an annual enrollment maximum of thirty-six (36) students. The project will streamline the current curriculum by reducing the program to a 24-month full-time master's degree program and increase the annual enrollment size by 60%. With the shortage of physicians selecting primary care as their practice area, the expansion of PA's is critical to addressing the gap of primary care providers in the Region and in Texas. However, PA's must also be attracted to primary care practice. UT Southwestern's project will address these issues by not only expanding the number of PA's available to our Region but through a PA trainee curriculum designed to foster an interest in primary care practice.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.2 Regional Healthcare Infrastructure and Patient Migration Patterns
- CN.3 Healthcare Capacity
- CN.4 Primary Care and Pediatrics

In addition, the community need for primary care providers in RHP9 is well-documented. According to the U.S. Government Accountability Office (http://www.gao.gov/new.items /d08472t.pdf), the national supply of primary care providers per 100,000 population is 90 physicians, 28 nurse practitioners, and 8 physician assistants, for a total of 126 providers per 100K population. Although Kaufman County has no Federally-designated Health Professional Shortage Areas, the primary care provider to 100,000 population ratio is the lowest among the three-county region, at 34.8/100K (http://county-health.findthedata.org/l/2650/Kaufman). Denton and Dallas Counties also suffer from a shortage of primary care providers, with Denton County reporting 51.8/100K and Dallas County with 83.9/100K population (http://www.texastribune.org/library/data/primary-care-workforce-shortages/). Furthermore, Dallas and Denton Counties have a number of Health Professional Shortage Areas, as described in the RHP 9 Community Needs Assessment (CNA.1).

Related Category 3 Outcome Measure(s):

OD-14 – Outcomes for Workforce Projects

IT-14.2 – Number of practicing nurse practitioners and physician assistants per 1000 individuals in HPSAs or MUAs

This Outcome Measure is selected to address the severe shortage of healthcare professionals in the Region 9 service area. By expanding the PA program and providing education and

experience treating the target population, it is expected that more practitioners will end up serving their needs after graduation.

Relationship to other Projects:
This project's focus on expanding primary care providers and emphasis on redesigning the PA program's curriculum to foster an interest in primary care ties to the following Category 1 and 2 projects:

- *126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics*
- *126686802.2.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network*
- *126686802.1.4—Implement UT Southwestern Population Management Infrastructure Development*
- *126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics*
- *126686802.2.2 –Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement*

Relationship to Other Performing Providers' Projects in the RHP:
No other providers in the RHP are expanding primary care trainees that will be licensed practicing providers.

Plan for Learning Collaborative: No other projects involve educating physician assistants. Therefore, there will be no opportunity for a Learning Collaborative.

Project Valuation:
A number of studies have been done to asses productivity of PAs compared to physician productivity. Not only are the comparisons favorable, there is some evidence that PAs see more patients per year than physicians do, and the utilization of PAs resulted in higher clinical productivity rates overall. (Crandall 1984; Hooker 1986; Hooker 1993; Scheffler 1996). Community benefit has also been documented by incorporating PAs into the provider mix. According to a Stanford University study by Hauser, "PAs appear not only to be cost effective, have the ability to provide comparable quality of primary medicine, and receive equal patient satisfaction, but it also appears they can significantly ameliorate the obstacle of access to care in underserved areas."

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of

total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criterion: 9.00

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criterion: 5.20

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criterion: 9.00

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criterion: 5.00

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criterion: 9.00

Total Valuation Score for this project: 7.00

Project Option 1.2.2: Training of Community Health Workers (CHWs)

Unique Project ID: 126686802.1.10
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UTSW") Faculty Practice Plan/ TPI 126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus.

Intervention(s): This project will develop a program designed to increase the number of certified CHWs in the region and respond to specific continuing education needs as identified by providers and CHWs.

Need for the project: Access to primary care, high emergency department utilization, high blood pressure, and a high rate of hospital readmissions are serious issues in RHP 9. To address some of these cost drivers, the Region needs more primary care resources to deploy in unique ways and in low cost settings. Therefore, we are proposing increasing the availability and utilization of certified CHWs trained in organized care delivery models.

Target population: The target population is all patients seen by UT Southwestern. Our hospital attributes days serving patients at 11% for Medicaid (i.e. based on weighted patient days). However, Community Health Workers will see anyone in the community regardless of where they receive their care. We expect Training Community Health Workers will improve access for all RHP 9 populations.

Category 1 or 2 expected patient benefits: This project is expected to benefit patients by providing additional access to primary care resources. We believe these resources and the additional care access will result in patients being more engaged in their own care as well as being able to avoid unnecessary readmissions, ED visits, and doctor visits. Finally we expect to positively impact blood pressure in the targeted population.

UTSW physicians provided care to Charity and Medicaid patients during 16,175 visits which were specifically at UT Southwestern outpatient practices. In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addition, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to expand access to primary care resources by training Community Health Workers. Our expectation is that this program will have a substantial impact on many patients in RHP 9. By adding approximately 126 primary care physicians, UTSW expects that by DY5 approximately 277,000 patients,

including 44,000 Medicaid/low income patients, could benefit from this program. We expect that by making available these additional primary care resources to the community, access will be expanded and costs can be reduced by avoiding care provided in high cost settings.

Category 3 outcomes:

IT-1.7 Controlling high blood pressure

Project Description:

This project will facilitate the expansion of primary care resources of the health care system in RHP 9. UT Southwestern will develop a program designed to increase the number of certified CHWs in the region and respond to specific continuing education needs as identified by providers and CHWs. Providers and clinic staff will be trained in how to integrate CHWs as members of the health care team.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goal and Relationship to Regional Goals:

Increase availability and utilization of certified CHWs trained in organized care delivery models, with an emphasis on team-based practice, quality and cost control, that will serve as members of healthcare delivery teams.

CHWs will be invaluable in helping the region achieve its goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system".

This project also meets the following regional goals:

Access to primary care, high emergency department utilization and a high rate of hospital readmissions are serious issues in our RHP 9. CHWs can use their unique understanding of the experiences, language and/or culture of the populations they serve to promote health of our community and reduce the burden of illness.

Challenges:

Need: 1) Lack of access to culturally appropriate care. 2) Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs.

Implementation: 1) Willingness of other providers/clinicians to incorporate CHWs in their care team. 2) Retention of trained CHWs. CHWs have been proven to be effective in serving as linkages between patients and the health system, helping patients to navigate the daunting challenges posed by the fragmented nature of health care delivery in the US. Most CHWs come

from the local population, are in touch with the community, and are better able to attend to the needs of patients by helping the system to deliver culturally sensitive care and by facilitating their access to health education and support, thereby providing an important and cost effective service to health care teams and to patients. Providers/clinicians will be training in the value that CHWs bring to the health care team and in how to incorporate them into the practice. The inclusion of CHWs into care teams in their community and competitive compensation will aid in the retention of trained CHWs.

5-Year Expected Outcome for Provider and Patients:

UTSW physicians provided care to Charity and Medicaid patients during 16,175 visits which were specifically at UT Southwestern outpatient practices. In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addition, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to expand access to primary care resources by training Community Health Workers. Our expectation is that this program will have a substantial impact on many patients in RHP 9. By adding approximately 126 primary care physicians, UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could benefit from this program. We expect that by making available these additional primary care resources to the community, access will be expanded and costs can be reduced by avoiding care provided in high cost settings. Several CHWs will have been trained for practice in the region, and more practices will have CHWs employed in team-based management models. Since CHWs are able to provide patients with culturally appropriate assistance, we would expect better health outcomes. For this project, the focus is on reducing rates of high blood pressure in patients of the target population.

Starting Point/Baseline:

UTSW does not currently engage CHW's; thus, this is a completely new initiative for UTSW. The baseline is zero. UTSW will be initiating this program in DY2.

Rationale:

CHWs are members of a team of public health professionals who use their unique understanding of the experiences, language and/or culture of the populations they serve to promote health. CHWs have proven to be an important link between healthcare providers, researchers and disadvantaged communities.

As leaders, CHWs bridge the gap between communities and the health care system – they act as liaisons between health care providers and patients. In the United States, CHWs have been a part of the health care delivery system since the 1960s. Their role has evolved over time and varies according to their work setting, which ranges from outreach workers in the community to clinic staff. CHWs have a broad skill set, including communication, leadership, advocacy, and both general and disease or condition-specific health knowledge. Duties performed by CHWs

range from counseling and health education to basic clinical tasks (HRSA, 2007). Regardless of their work environment, CHWs are trusted members of the community in which they work and typically reflect the demographic characteristics of the area. Their knowledge of the community allows them to effectively relay culturally competent information to community members, connect them to local health and social services, and advocate on their behalf. Nationally and internationally, CHWs are viewed as part of the solution for achieving improved health status in rural and disenfranchised communities.

For many years CHWs have provided an array of health care services in different settings. Recently their role has been elevated, nationally and internationally, as opportunities for integrating CHWs into the health care delivery system are discussed. In 2009, the US Department of Labor recommended the creation of a Standard Occupational Classification for CHWs. This act opened the door for additional integration into the US health system. The 2010 Patient Protection and Affordable Care Act (health reform law) identified community health workers as having major roles in achieving the goals of health care reform and a means of addressing health inequities. At the International level, the United Nations Millennium Development Goals (MDGs) acknowledge the importance of human capital. In an effort to progress toward meeting health-related MDGs, the World Health Organization recommends CHWs as a part of the health service workforce (Achieving the health-related MDGs. It takes a workforce! 2010).

This project aims to demonstrate improved health outcomes, return-on-investment, and increased patient satisfaction when CHWs are integrated into the health care team affiliated with UT Southwestern.

- Increased primary care training may help address the primary care workforce shortage.
- Including primary care trainees in quality improvement has been linked to trainee satisfaction with primary care.
- Regular assessment of trainee knowledge is critical to adapting programs to address needs and capacity to serve in primary care settings. Improvement of knowledge reflects effectiveness of the training program vs. just the increase in the number of enrollments.
- Regular assessment of trainee satisfaction is critical to adapting programs to address needs and further foster a commitment to serve in primary care. Increased satisfaction helps with the sustainability of the project.

Project Components:

Through the Training of Community Health Workers (CHWs) Program, we propose to meet all required project components listed below.

a) Increase the number of community health workers/promotoras being trained and placed with healthcare teams, and

b)Training providers and clinic staff on how to integrate CHWs as members of the health care team.

For the Training of Community Health Workers (CHWs) Program, we have identified in the table below the milestones and metrics based upon the above project components and relationship to project goals and population needs.

How the project represents a new or significantly enhances an existing delivery system reform initiative:

The project represents a new initiative for UT Southwestern.

Unique Community Needs Assessed:

- CN.3 – Healthcare Capacity
- CN.4 – Primary Care
- CN.8 – Chronic Disease
- CN.12- Emergency Department Usage

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management
IT-1.7 Controlling high blood pressure

Reasons/rationale for selecting the outcome measures:

Approximately 76.4 million (33.5 percent) of people in the United States have high blood pressure. Numerous clinical trials have shown that aggressive treatment of high blood pressure reduces mortality from heart disease, stroke and renal failure; results are particularly striking in elderly hypertensive patients, which are more likely to have heart failure. A pool of past clinical trials demonstrated that a 5 mm to 6 mm Hg reduction in diastolic blood pressure was associated with a 42 percent reduction in stroke mortality and a 14 percent to 20 percent reduction in mortality from coronary heart disease (CHD). Literature from clinical trials indicates that 53 percent to 75 percent of people under treatment achieved control of their blood pressure. The specifications for this measure are consistent with current guidelines, such as those of the USPSTF and the Joint National Committee. By expanding the number of Community Health Workers, more at-risk Medicaid and low income patients can have their blood pressure regularly screening and alerted to the need for seeing a primary care provider earlier.

Relationship to other Projects:

- ***126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care***

Clinics: This project improves access to primary care services by creating a robust Network of efficient, quality primary care physicians for RHP 9 patients. As community-based primary care physicians join the Network, they will no longer be practicing in "isolation". Through clinical integration with UT Southwestern faculty physicians, these community-based primary care physicians will engage in the continual development and implementation of clinical "best practice" protocols for the diseases treated by all Network physicians that are also responsible for the largest percentage of medical costs.

- ***126686802.1.1.4—Implement a Quality Incentive Program for Network Primary Care Providers:*** UTSCAP Primary Care Network clinics will be able to participate in a quality incentive program. However, their ability to participate in this quality incentive program will be dependent upon their enrollment and participation in the Medicaid program, creating an environment whereby primary care physicians see all populations as a viable part of a broader patient population management program.

- ***126686802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.2.9.1—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

Relationship to Other Performing Providers' Projects in the RHP: N/A

Plan for Learning Collaborative:

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied

towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 2.5 X 2 = **5**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 2.5 X 2 = **5**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 3 X 2 = **6**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 3.5 X 2 = **7**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 4 X 2 = **8**

Total Valuation Score for this project: **5.7**

These values are provided for in the table below and are allocated equally amongst the milestone

Project Option: 1.9.2 – Improve access to specialty care services
Title of Project*:* UT Southwestern Medical Center: Establish/Expand Urgent Care Services for Cancer Patients

RHP Project Identification Number: 126686802.1.11 (Pass 2)
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/ TPI 126686802

Summary Information
Summary Description: This project will expand a pilot program that began in September 2012, creating an Urgent Care Clinic providing immediate access for the Simmons Cancer Clinic (SCC) patients experiencing acute symptoms or complications of treatment. The goal is to reduce ED visits, improve time-sensitive care, and streamline admissions to University Hospital St. Paul. A mid-level provider and a nurse, under the supervision of an oncologist, will staff the Urgent Care Service.

Provider*:* The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy Hospitals and 40 clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. In 2011, UTSW physicians provided care to Charity and Medicaid patients during 16,175 visits which were specifically at UT Southwestern outpatient practices.

Intervention: When cancer patients undergoing treatment experience complications and acute symptoms, they are usually referred to the ED or the go directly to the ED because their symptoms appear after clinic hours. By providing a triage nurse and an Urgent Care Service that is staffed with oncology-trained staff, most acute episodes can be treated without an expensive ED visit or inpatient admission. The Urgent Care Service will be expanded to include evenings, nights and weekends to be available whenever patients are in crisis.

Need for Project: The RHP 9 Community Needs Assessment shows that cancer patients represent most of the highest cost ED encounters for all payors in the Region. In addition, potential preventable admissions of cancer patients are among the most expensive admissions for all payors and all cateogries. The pilot project data showed that an Urgent Care Service for Cancer Patients could reduce avoidable ED visits and inpatient admissions by up to 80%. Cancer-related Medicaid and Uninsured inpatient encounter costs totaled $23,089,618 compared to the total cost for all payors of $86,421,715.

Target Population: All active patients being seen in the Simmons Cancer Center Clinic (SCCC) represent the entire target population. Approximately 4% of SCCC patients are Medicaid. Medicaid and low-income patients are more likely to resort to using the ED for the complications and acute symptoms.

Category 1 & 2 Expected Patient Benefits:

The new service can provide patients will immediate traige and initial treatment in under an hour, depending on where they live. In its first month of operation, the program prevented 48 ED visits and potentially 40 avoidable inpatient admissions, or at least 2 Medicaid ED visits and 1 Medicaid admission per month. That could avoid up to $100,000 in Medicaid costs and improve outcomes every month.

Category 3 Outcomes:
OD-9 Right Care, Right Setting; IT-9.2: ED appropriate utilization
OD-2 Potentially Preventable Admissions; IT-2.13: Other Admission Rates (complications of cancer treatment)

Project Description:
UT Southwestern operates the only NCI-designated Comprehensive Cancer Center in north Texas. Until recently, the Simmons Cancer Clinic (SCC) patients experiencing acute symptoms, whether due to their cancer, cancer treatment, or an unrelated illness, are referred to the University St. Paul Emergency Department (ED) for symptom management and resolution. From Fiscal Year 2011 to Fiscal Year 2012, the average number of ED visits grew 48%, from 40 ED encounters per month to 59 ED visits per month, largely due to increases in SCC patient volume growth.

This project will expand a pilot program that began in September 2012, creating an Urgent Care Clinic designed to provide immediate access for the Simmons Cancer Clinic (SCC) patients experiencing acute symptoms. The goal of the SCC Urgent Care Clinic is to reduce ED visits, improve time-sensitive care, and streamline admissions to University Hospital St. Paul, when appropriate, in a cost effective manner. The pilot program operates Monday through Friday during normal clinic hours, which are 8:00 a.m. to 5:00 p.m. A mid-level provider and a nurse, under the supervision of an oncologist, will staff the Urgent Care Service. Cancer patients undergoing active treatment for their condition who develop treatment-related and/or disease-related side effects will be referred by a triage nurse to the Urgent Care Clinic. The conditions could include fever, fatigue, nausea, anorexia, respiratory infection, sinusitis, mouth sores, vomiting, diarrhea, constipation, dehydration, hypovolemia, electrolyte imbalance, skin rash, neutropenia, and neuropathy. If the triage nurse determines that the patient should go directly to the ED, the triage nurse will coordinate the ED visit and treatment/care that the patient receives. Oncology specialists will work with ED physicians to determine if an admission is appropriate.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:
The project goals are:

- Reduce the number of Simmons Cancer Clinic patients referred to, or going directly to, the ED (75% reduction during FY2013);

- Increase timeliness of care for call-in patients experiencing acute symptoms (1 hour or less time between telephone call and the time treatment is initiated, depending on where they live);
- Improve patient satisfaction regarding access to care;
- Improve the process for direct admission to the hospital, when inpatient admission is necessary.
- Extend Urgent Care Clinic hours to evenings and weekends, as determined by demand and need.

The project goals relate directly to, and strongly support, the Regional goals for

- improved access to care,
- improved care coordination and management, and
- improved provider performance and outcomes.

The project will address the following RHP 9 Community Needs Assessment priorities:

- CN.8 – Chronic Disease Management
- CN.9 – Access to Specialty Care
- CN.12 – Emergency Department (ED) Usage and Readmissions

While the number of cancer patients identified in the Community Needs Assessment is small (9,082 from Q3-2010 through Q3-2011), cancer patients rank in the top 3 to top 5 diagnoses for Highest Charge per Encounter for Medicaid and Uninsured patients (range from $1,593 to $10,692 per encounter). Admissions for cancer patients represent the Highest Charge per Encounter for all payor categories (range from $29,987 to $163,893).

Challenges:

The region has a well-defined health professions shortage. The challenge for this project is being able to recruit and train mid-level providers and nurses who understand both the side effects and complications associated with cancer treatment, as well as how to triage and treat acute symptoms in an urgent care setting. Another challenge is educating patients and their families that it is appropriate to call the Cancer Center's Urgent Care Services when acute symptoms are being experienced so that the patients can be triaged and directed for the right care in the right place in a timely manner. The third challenge for the Performing Provider is the rapid growth of the Simmons Cancer Center patient volume. This project will address these challenges by educating patients and their families in the management of side effects and

complications. As the pilot program proves its value, the SCC will recruit mid-level providers and nurses in advance of the need in order to assure adequate time to provide advanced training in the required skills to care for the acute cancer patient.

5-Year expected outcomes for Provider and Patients:

BY DY5, we expect to avoid up to 3,000 avoidable Emergency Department visits and 2,400 avoidable hospital admissions. We project that there would be approximately 90 avoidable ED visits and 72 avoidable hospital admissions for Medicaid patients. That translates into between $750,000 and $1,000,000 in immediately avoidable costs, significant improvement in outcomes and quality of life during cancer treatments. Data will be collected and evaluated to determine if the outcomes for patients who can avoid PPAs and HACs during the PPAs are better than those patients who resort to ED visits and PPAs. Patients benefiting per DY is estimated to be DY2 -500, DY3-750 DY4-850, DY5-900. For Medicaid patients alone, the avoidable costs alone would be over $4,000,000. Given the tendency for Medicaid patient ED utilization to be higher than other groups, the potential costs savings could be much higher. Quality of life and patient satisfaction will also be much higher for all populations.

Starting Point/Baseline:

The Simmons Cancer Center Urgent Care Services pilot began on September 1, 2012. The baseline will effectively be determined in DY2. DY1 data is comprised of just one month, which was the beginning of the pilot program start-up.

Rationale:

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's Faculty Practice Plan is one of the providers for physician services in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

The RHP 9 Community Needs Assessment shows that cancer patients represent most of the highest cost ED encounters for all payors in the Region. In addition, the CNA data shows that potential preventable admissions of cancer patients are among the most expensive admissions for all payors and all cateogries. The limited pilot project data suggests that an Urgent Care Service for Cancer Patients could reduce avoidable ED visits and inpatient admissions by up to 80%.

The Community Needs Assessment data shows that Medicaid and uninsured patients accounted for 371 of the 1,295 cancer-related inpatient admissions from the ED during the CNA data period. Cancer-related Medicaid and Uninsured inpatient encounter costs totaled $23,089,618 compared to the total cost for all payors of $86,421,715. Cancer-related Medicaid and Uninsured ED encounters costs, deatiled totaled $965,221 compared to $2,097,949 for all payors. Cancer-related ED encounters for Medicaid and uninsured patients totaled 188 out of the 359 ED encounters for all payors, according the DFW Hospital Council data in the CNA.

UTSW selected this project because access to urgent care services are limited for any condition, but is non-existent for Cancer patients. The new service, and the innovative model of urgent care, can provide patients will immediate traige and initial treatment in under an hour, depending on where they live. They could receive the right care, at the right time, in the right setting, avoiding unnecessary, expensive and disruptive ED visits and inpatient admissions.

When cancer patients undergoing treatment experience complications and acute symptoms, they are usually referred to the ED or the go directly to the ED because their symptoms appear after traditional clinic hours. All too often, the ED staff are not sufficiently familiar with the particular patient and admit the patient for treatment and monitoring of the patient's condition. By providing a triage nurse and an Urgent Care Service that is staffed with oncology-trained staff, most acute episodes can be treated without an expensive ED visit or inpatient admission. The Urgent Care Service will be expanded to include evenings, nights and weekends to be available whenever patients are in crisis.

How the project represents a new or significantly enhances an existing delivery system reform initiative:

The development of the new Urgent Care Service for Cancer Patients is a new initiative for UT Southwestern and the Simmons Cancer Center. The innovative model of meeting the urgent needs of patients within a traditional schedule-driven delivery system is an effort to transform the usual fragmented care delivery into a more coordinated delivery process. UTSW hopes that this model will be successful and can be duplicated in other ambulatory clinics across the UT Health System and in Region 9.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.3 - Healthcare Capacity
- CN.9 - Chronic Disease
- CN.12 - Emergency Department Usage and Readmissions

Related Category 3 Outcome Measure(s):

OD-9 Right Care, Right Setting
IT-9.2 ED appropriate utilization
OD-2 Potentially Preventable Admissions
IT-2.13 Other Admission Rates (complications of cancer treatment)

Reasons/rationale for selecting the outcome measures:

Preventable ED visits and preventable inpatient admissions significantly disrupt the treatment plan and continuum of care for cancer patients. Being able to receive both routine care and

urgent care from the same highly-skilled clinical team would improve patient satisfaction, improve outcomes, and reduce the cost of care. The two chosen measures reflect the goal of the project which is to reduce potentially preventable ED encounters and inpatient visits.

Relationship to other Projects: This project relates to one other proposed project in terms of improving access, capacity and performance across all specialty care settings. The specific projects include:

126686802.1.5 Expand specialty care capacity

Relationship to Other Performing Providers' Projects in the RHP:
There are six other Category 1.9 projects in the RHP 9 Plan for Pass 1 to expand access to specialty care, include project being proposed by Baylor Medical Center at Carrolton, Baylor Medical Center at Garland, Baylor Medical Center at Irving, Baylor University Medical Center, CMC of Dallas, Parkland Health and Hospital System, Texas Scottish Rite. The list for Pass 2 projects has not been released.

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region. UT Southwestern will participate in the Collaboratives as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:
The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 9.00

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 8.00

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 9.00

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 9.00

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 9.00

Total Valuation Score for this project: **8.30**

Project Option: 1.10.2 Enhance improvement capacity through technology
Title of Project: A Health System Quality Improvement Center at UT Southwestern

Unique RHP Project Identification Number: 126686802.1.12 (Pass 2)
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Proactice Plan/TPI 126686802

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 24% of UTSW patient visits were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will implement the development of a comprehensive center involved with data reporting, methodologies of quality improvement, and systems re-engineering of health care delivery at UT Southwestern ("Quality Improvement Center").

Need for the project: UT Southwestern has a robust quality improvement program that is effective but it lacks the cutting edge expertise in systems engineering and quality metrics analysis and reporting.

Target population: The target population is all patients seen at UT Southwestern University Hospitals and Clinics including all Medicaid and indigent patients. Our hospital attributes days serving patient at 11% for Medicaid (i.e. based on weighted patient days), while our faculty clinical practice population is comprised of approximately 3% Medicaid and indigent patients. Thus, we expect at least 11% of the benefits of the Quality Improvement Center to impact Medicaid and/or indigent patients.

Category 1 or 2 expected patient benefits: The project seeks to provide health care delivery re-engineering and data reporting capabilities to providers and patients of UT Southwestern.

Category 3 outcomes:

- IT-3.1 All cause 30 day readmission rate - Our goal is to reduce the 30-day potentially preventable all-cause readmission rate by 5% over the DY2 baseline by DY5.

Title of Project: A Health System Quality Improvement Center at UT Southwestern

Unique RHP Project Identification Number: 126686802.1.12 (Pass 2)

Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Proactice Plan/TPI 126686802

Project Summary:

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 24% of UTSW patient visits were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will implement the development of a comprehensive Quality Improvement Center involved with data reporting, methodologies of quality improvement, and systems re-engineering of health care delivery at UT Southwestern ("Quality Improvement Center"). By generating more data, more performance activities will be initiated, resulting in cost avoidance and outcomes improvements.

Need for the project: UT Southwestern has a robust quality improvement program that is effective but it lacks the cutting edge expertise in systems engineering and quality metrics analysis and reporting.

Target population: The target population is all patients seen at UT Southwestern University Hospitals and Clinics including all Medicaid and indigent patients. Our hospital attributes days serving patients at 11% for Medicaid (i.e. based on weighted patient days), while our faculty clinical practice population is comprised of approximately 3% Medicaid and indigent patients. Thus, we expect at least 11% of the benefits of the Quality Improvement Center to impact Medicaid and/or indigent patients. In absolute numbers, 11% of hospital days of 20,000 discharges will be attributed to Medicaid and charity as well as 3% of 750,000 outpatient visits (22,500 visits). Based on the other projects being proposed for RHP 9, the target population will increase over the next 4 years, and beyond.

Category 1 or 2 expected patient benefits: The project seeks to provide health care delivery re-engineering and data reporting capabilities to providers and patients of UT Southwestern.

Category 3 outcomes:

- IT-3.1 All cause 30 day readmission rate - Our goal is to reduce the 30-day potentially preventable all-cause readmission rate by 5% over the DY2 baseline by DY5. Generating more quality data and dashboards will lead to new ways to achieve this outcome.

Project Description:

This project describes the development of a UT Southwestern quality data management and systems engineering group that will provide expertise to our hospitals and clinics in the area of industrial and systems engineering improvement methods to improve patient safety, operational efficiency, access to care and costs. Our health system already has some expertise in Lean and Six Sigma methodologies, but this group will provide more expertise in other cutting edge methodologyies of industial, systems and human factors engineering. We plan to recruit recruit industrial, systems and human factors engineers that will work with our quality improvement projects to apply systems engineering improvement science to major healthcare processes and develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement. The Quailty Improvement Center will also develop interdisciplinary courses for healthcare professionals, students, post graduate trainees, engineers and administrative healthcare leadership.

In addition, the project will develop quality improvement capacity at UT Southwestern assisting the Strategic Planning Office in developing quality improvement dashboards through the Quality Improvement Center that will integrate quality improvement (QI) data from various institutions and national reporting agencies, measure, report monthly specialty specific data, and serve as the engine to drive, conduct and rapidly diffuse quality and patient safety improvements. Through these reports, UT Southwestern will support on-going quality improvement projects and promote patient safety culture change with rapid diffusion of key successful process between departments and hospitals.

The population served will include all patients seen in the UT Southwestern University Hospitals and Clinics. This includes over 20,000 hospital discharges per year in two University Hospitals and over 700,000 ambulatory visits in the University's clinic system. The Center will provide dashboards, reporting and analytics for all publically reported clinical process and outcome metrics including quality, patient safety and patient satisfaction data. The metrics will include, but not be limited to, CMS Core Measure, Patient Safety Indicators, Hospital Associated Conditions, Hospital Associated Infctions, Patient Satisfaction, Never Events, readmissions, and mortality. The metrics will be measurable at the individual provider level which will also include clinical process and outcome measures for diseases identified as high risk and utilization . Our hospitals attributes days at 11% for Medicaid and charity (i.e. based on weighted patient days), while our faculty clinical practice population is comprised of approximately 3% Medicaid and indigent patients. Thus, we expect at least 11% of the benefits of the Quality Improvement Center to impact Medicaid and/or indigent patients. In absolute numbers, 11% of hospital days of 20,000 discharges will be attributed to Medicaid and charity as well as 3% 0f 750,000 outpatient visits (22,500 visits).

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goal and Relationship to Regional Goals:

The goals of this project are to (1) expand quality improvement capacity throughout UT Southwestern so that we are able to conduct, report, drive and measure quality improvement and (2) implement process improvement methodologies at UT Southwestern to improve safety, quality, efficiency and access to care. These goals are strongly related to the Regional goals of not only providing more access to care, but to provide more access to quality care.

Challenges:

UTSW has been challenged with: 1) high rates of preventable hospital admissions, 2) high rates of preventable hospital readmissions, and 3) high rates of some preventable complications of hospitalization. These have in part due to the high acuity of UTSW University Hospital patients, but the high rates persist even after risk adjstment for acuity.

Implementation: 1) Recruitment and retention of systems engineers. 2) Training of systems users. This project will assist in our current clinical transformation at UT Southwestern that has put quality and patient safety as its primary mission. Potentially preventable hospital admissions, readmissions, and hospital complications are high profile measures of the quality of care provided by an institution and this project will improve that quality.

5-Year Expected Outcome for Provider and Patients:

Our hospitals attributes days at 11% for Medicaid and charity (i.e. based on weighted patient days), while our faculty clinical practice population is comprised of approximately 3% Medicaid and indigent patients. Thus, we expect at least 11% of the benefits of the Quality Improvement Center to impact Medicaid and/or indigent patients. In absolute numbers, 11% of hospital days of 20,000 discharges will be attributed to Medicaid and charity as well as 3% 0f 750,000 outpatient visits (22,500 visits). Successful establishment of a quality data and systems engineering center, i.e. the Quaity Improvement Center, creation of quality improvement dashboards and improvement in care delivery processes leading to decrease in potentially preventable readmissions and complications of hospitalization, cost avoidance and improved patient outcomes. Based on the other projects being proposed for RHP 9, the target population will increase over the next 4 years, and beyond.

Starting Point/Baseline:

UTSW currently has an Office of Quality Improvement and safety with 10 employees involved in quality improvement training and some data analysis. This project will primarily be to start an re-engineering componenet to our quality improvement activities and exapnd out analytic capability to include predictive modeling.

Rationale:

Performance improvement and reporting is a very large component of success of all of the project areas across the DSRIP project categories. Two of the drivers for significant transformation of health care delivery will be accurate, actionable data and re-engineering of

the processes of health care delivery. The Institute of medicine defines the quality of medical care as "the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge"(To Err is Human, 2000, Institute of Medicine). According to the Institute of Medicine (IOM), the majority of medical errors result from faulty systems and processes, not individuals. Because errors are caused by system or process failures, it is important to adopt various process improvement techniques to identify inefficiencies, ineffective care, and preventable errors to then influence changes associated with systems. This project seeks to implement the process changes necessary at UT Southwestern that will drive improved quality and safety.

Project Components:

This group will work through the office of Quality Improvement and Safety at UT Southwestern to meet the following required project components:

a) Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture.

b) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.

c) Design data collection systems to collect real-time data that is used to drive continuous quality improvement

For this project we have chosen the following milestones and metrics:

Unique community need identification numbers the project addresses:

- CN.9 (High rates of preventable hospital readmissions)
- CN.10 (High rates of preventable hospital admissions)
- CN.11 (Patient Safety and Quality)

How the project represents a new or significantly enhances an existing delivery system reform initiative: Current we do not have re-engineering expertise in the form of trained industrial or human factors engineers. This project will add that expertise. We currently have analysts involved in quality reporting functions but this project will add significant capability for advanced analytics and predictive modeling.

Related Category 3 Outcome Measure(s):

IT-3.1 All cause 30 day readmission rate

Reasons/rationale for selecting the outcome measures: This project will improve many areas of health care delivery in our systems. We chose the outcome measure of 30 day readmissions because that is one area that where UTSW currently scores below average by University Health System Consortium metrics.

Relationship to other Projects:

This project's focus on creating the Quality Improvement Center at UT Southwestern is strongly tied to all our Category 1 and 2 projects because we cannot increase access or capacity without the simultaneous pursuit of quality. The following projects are samples of our Category 1 and 2 related to the implementation of the Quality Improvement Center:

- 126686802.2.3—Redesigning for Cost Containment
- 126686802.1.1—Expand existing primary care capacity
- 126686802.2.1—Enhance/Expand Medical Homes
- 126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics

- 126686802.1.3—Implement a Quality Incentive Program for Network Primary Care Providers

- 126686802.1.4—Implement UT Southwestern Population Management Infrastructure Development

- 126686802.2.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network

- 126686802.1.7—Implement telemedicine program
- 126686802.2.2—Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement

- 126686802.2.5—Expanding Care Transition Programs

Plan for Learning Collaborative:

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following

exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 4.5 X 2 = 9

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 4.5 X 2 = 9

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 3.88 X 2 = 7.75

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 4.5 X 2 = 9

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 4.5 X 2 = 9

Total Valuation Score for this project: **8.3**

These values are provided for in the table below and are allocated equally amongst the milestones

Project Option: 1.9.3 Implement other evidence-based project to expand specialty care capacity in an innovative manner not described in the project options above.
Title of Project: Expanding specialty care capacity by providing access to bone marrow and solid organ transplants for patients with inadequate funding.

Unique Project ID: 175287501.1.1 (Pass 2)
Performing Provider Name/TPI: The University of Texas Southwestern University Hospitals/ 175287501

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 24% of UTSW patient visits were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will implement a mechanism for underfunded patients who need solid organ and bone marrow transplants to be evaluated and receive transplant if qualified.

Need for the project: Currently the patients frequently do not receive evaluation for needed transplant leading to frequent hospitalizations and premature death.

Target population: The target population is all patients in North Texas who are referred to UT Southwestern Medical Center that need evaluation for transplant but have inadequate funding.

Category 1 or 2 expected patient benefits: The project seeks to increase specialty access and treatment for patients currently not offered the service in many cases. By DY5, we project an additional 88 targeted patients will be referred to the UT Southwestern Transplant Program, 31 patients will be listed for transplant, and 20 targeted patients will receive transplants.

Category 3 outcomes:
OD-4 Potentially preventable complications
IT-4.2 Central line-associated bloodstream infection rates

IT-1.20 Other-Outcomes of solid organ and bone marrow transplantation

Project Description:

Currently, indigent and Medicaid patients, especially managed Medicaid, are less likely to receive needed bone marrow, heart, lung and liver transplants when compared to matched patients with funding through Medicare or commercial insurance (King, et al, 2005). Despite contributing significantly to the donation of organs and tissue for transplantation, these patients do not, many times, receive these life-saving procedures because of a lack of adequate funding. Certain funding programs such as traditional Medicaid may fund part of the cost of the transplant but many of these patients then lack the resources or funding for expensive post-transplant care, including immunosuppressive medications. This lack of resources causes many patients to be declared ineligible by transplant programs. We propose a program to address this disparity by offering these transplant services to medically eligible indigent and Medicaid patients through our current transplant programs.

Our plan is to evaluate all patients referred to UT Southwestern for transplantation from North Texas. Patients with no or inadequate transplant and post-transplant funding will be covered by this project. Currently, unfunded patients are not offered solid organ transplants at a North Texas Center. UT Southwestern has a large and successful solid organ and bone marrow transplant program. The number of patients who have been evaluated, listed and transplanted in this program over the past few years are listed in Exhibit 1.

For this project, patients who meet transplant criteria will be listed for transplantation regardless of transplant of post-transplant funding status. Since the number of patients who will eventually be transplanted will depend on organ availability and allocation - which is not controlled by the transplanting team or organization - total transplant number of unfunded patient will not under the control of the provider. However, we have estimated the number of transplants that will result from the number of listings. Listed patients, funded and unfunded, will receive transplant using current clinical criteria. Using our current ratios of evaluated to listed and eventual transplanted patients, we expect to see the following number of unfunded or underfunded patients in this project:

	DY2	DY3	DY4	DY5
Number of referrals	0	5	30	40
Patients listed	0	2	10	15
Transplanted	0	0	10	10

Exhibit 1: Transplant Operating Statistics by Fiscal Year

	FY10	FY11	FY12	3 Year Total
Referrals:				
Heart	150	138	148	**436**
Lung	150	229	254	**633**
Kidney*	348	326	340	**1,014**
Kidney	240	243	332	**815**

Liver ** including El Paso*	127	259	328	**714**

Evaluations:

Heart	39	61	94	**194**
Lung	30	75	120	**225**
Kidney*	252	197	218	**667**
Kidney	142	175	216	**533**
Liver ** including El Paso*	69	153	200	**422**

Waitlist Additions:

Heart	37	28	27	**92**
Lung	31	46	83	**160**
Kidney	69	106	77	**252**
Liver	24	49	88	**161**

Transplants:

Heart	22	24	26	**72**
Lung	24	36	60	**120**
Kidney	37	28	38	**103**
Liver	11	15	41	**67**

Sustainability of this project will be address by the end of DY5. UT Southwestern will remain committed to caring for these patients after the project is completed. We will work with the Dallas County Hospital District, Medicaid and other payors to maintain adequate funding for these transplanted patients after the DSRIP funding ceases.

Collaboration

This project is one of two projects being proposed through a collaboration agreement. The specific collaboration arrangement specific to this project is set forth below.

Collaborators	DY2	DY3	DY4	DY5	Total
Parkland Memorial Hospital	3,395,195	3,521,210	3,764,879	4,094,434	14,775,718
Project / Collaboration	**DY2**	**DY3**	**DY4**	**DY5**	**Total**
Category 1 Project Value	3,037,806	3,106,950	3,100,136	2,504,830	11,749,722
Related Category 3	357,389	414,260	664,743	1,589,604	3,025,996

Projects Value					
Total Project Value	**3,395,195**	**3,521,210**	**3,764,879**	**4,094,434**	**14,775,718**

The collaboration involves the transfer of Pass 2 allocated dollars from Parkland Memorial Hospital (public entity) to the performing provider (public entity). The combined project value for this project equals the funding provided by the collaborating entity.

The collaborating parties have joined together in this collaboration with the belief that the goals of this project are valuable and will contribute to regional transformation.

Goal and Relationship to Regional Goals:

The goal of this project is to address a major disparity in access to specialty care for patients with inadequate funding.

Challenges:

Providing this service to medically eligible patient poses significant challenges to UT Southwestern as it would for any transplant program. Solid organ and bone marrow transplantations have substantial costs which include the initial evaluation, the transplant procedure, recovery, rehabilitation, and long term follow up with immunosuppressive therapy. Complications of the transplant and immunosuppression therapy can also be very costly. In addition, many uninsured patients who have temporary funding for the transplant do not have coverage for the long-term immunosuppression therapy which is very costly.

This project addresses these challenges by providing adequate funding to evaluate potential candidates then transplant and provide follow up care that is not available through other funding sources if a transplant is deemed appropriate.

5-Year Expected Outcome for Provider and Patients:

The project seeks to increase specialty access and treatment for patients currently not offered the service in many cases. By DY5, we project an additional 88 targeted patients will be referred to the UT Southwestern Transplant Program, 31 patients will be listed for transplant, and 20 targeted patients will receive transplants. The milestone and outcome metrics for the project are consistent with standard outcomes for transplant patients with other funding sources. The key improvement in DY4 and DY5 will be the 1-year survival of patients who are transplanted in the underfunded group which will be the same as for funded patients. The Category 3 outcome will examine the number of central line-associated infections in these patients after transplantation. This outcome is key to improving survival rates.

Starting Point/Baseline:

UT Southwestern is a nationally recognized center for solid organ and bone marrow transplantation services with mature programs involving heart, lung, kidney, liver, and bone marrow procedures. The UT Southwestern solid organ and bone marrow transplant program has outcomes for these services that rank in the top tier of the United States. The number of

referrals, evaluations, candidate listings, and transplants in each of these categories is listed in exhibit 1. This project proposes to increase the number in all of these categories by adding patients who lack funding or are underfunded. The metrics will be conservative given the fact that transplantation depends on many factors including the suitability of referred patients for transplantation by medical criteria, availability of organs for transplantation and social issues that could affect the candidate.

Rationale:

This project seeks to address this disparity by offering transplants to any suitable eligible patient regardless of funding. Evidence has shown that recipients of heart, liver and bone marrow transplants have a reduced cost of care and certainly have better mortality and quality of life outcomes than patients with advanced heart and liver failure and some hematologic malignancies treated with medical interventions without transplantation (Jarl and Gerdtham, 2011). This program addresses this disparity. The metrics and milestones chosen represent standard measures of patient evaluation, number of transplants and outcomes.

The targets selected for the milestones and metrics of this project were selected taking into account the variability of referred patients with respect to their suitability and criteria for transplantation. The first two years will focus primarily on attracting suitable referrals to the transplantation programs. The second two years will focus on the number of transplants and clinical outcomes of patients who are transplanted. Milestone 1 will be a customized milestone to document a gap analysis of the number or proportion of underfunded patient who are not offered the possibility of transplantation as a treatment option. We have estimated the number of transplants metric since most of the waiting list additions are later in this project and time on the waiting list is relatively unpredictable. Historically, we have transplanted approximately 60% of listed patients.

Unique community need identification numbers the project addresses:

- CN.1 Community Overview and Description
- CN.3 Healthcare Capacity
- CN.8 Chronic Disease
- CN.9 Specialty Care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project significantly enhances the UT Southwestern transplant center's ability to expand access to specialty care, i.e. transplant services, to a segment of our population that currently does not have access to these live-saving services.

Related Category 3 Outcome Measure(s):
The outcome measures for this program will include one standalone Category 3 Outcome Measure relating to complications of transplantation and one nonstandalone measure unique to this project .

OD-4 Potentially preventable complications
IT-4.2 Central line-associated bloodstream infection rates

IT-1.20 Other-Outcomes of solid organ and bone marrow transplantation

Reasons/rationale for selecting the outcome measure:
The central line-associated blood stream infection rate was chosen because central line infections are a complication of the immunosuppression and the high number of central line days in these patients. This complication adds significant risk to the patient in terms of morbidity and mortality and adds significant cost to the treatment of transplant patients.

The mortality outcome is an outcome measure tailored to this project. The measure will be the 1-year survival of all patients, including indigent and Medicaid patients, undergoing the transplant services at UT Southwestern. This is a standard measure used by transplant programs to assess the clinical effectiveness. The goal will be for these underfunded patients to have the same 1-year survival rates as the general transplant population in our region. The description of how this metric will be calculated and compared to regional averages is described in the category 3 Project.

Relationship to other Projects:
This project is very unique and focused on addressing a major disparity by **expanding access to specialty care** for patients requiring a solid organ or bone marrow transplant who have inadequate funding.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative:
This project is unique to RHP 9. However, addressing this disparity in access to solid organ and bone marrow transplants is expected to alleviate the burden on RHP 9's safety-net hospitals for caring for these patients.

Project Valuation:
The valuation of this project takes into account two factors. First, the number of patients that need to be evaluated to result in one transplant was considered. The cost of this evaluation is significant and must be borne by the performing provider when outside funding does not exist. The cost of the transplant and recovery with follow up care was also considered. In addition, the number of patients who need bridging with a VAD (ventricular assistance device) was considered for the heart transplant patients. Finally, the possible avoidable cost of recurrent hospitalizations for chronic conditions precipitating the consideration for transplant for the patients, especially if the program is later scaled to a larger population, was an important factor

if community and future medical costs are considered. Patients with severe chronic liver disease, congestive heart failure and chronic lung disease who would be considered for transplant utilize inpatient services in the form of recurrent hospitalizations to stabilize their chronic condition. Transplantation offers the advantage over medical treatment of these patients of decreasing the need for recurrent hospitalization and improving overall quality of life (Jarl and Gerdtham, 2011).

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

   This project's score for this criteria: 4.5 X 2 = 9

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

   This project's score for this criteria: 4.5 X 2 = 9

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

   This project's score for this criteria: 4.5 X 2 = 9

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 5 X 2 = 10

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 4.84 X 2 = 9.67

Total Valuation Score for this project: 8.80

D. Category 2: Program Innovation and Redesign

Project Option 2.2.2 – Expand Chronic Care Management Model - Chronic Disease Management and Prevention Program

RHP Project Identifier: 195018001.2.1
Performing Provider/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/195018001

Provider: Baylor Medical Center at Carrollton is a 235-bed acute care facility located in Carrollton. The medical staff is comprised of over 500 physicians representing more than 50 specialties. Baylor Carrollton is a full service hospital providing comprehensive diagnostic, surgical, and medical care for inpatients and outpatients, as well as 24-hour emergency care. Baylor Carrollton's service area represents a population of 592,000.

Intervention(s): The project purpose is to provide focused education and point of care testing for underserved patients who have diabetes, CVD and/or Respiratory disease that are in need of education, clinical management and training within a primary care setting. We will co-locate primary care and chronic disease management services to improve clinical outcomes.

New v. existing initiative: This will be a new project, providing chronic disease education and management services to the Medicaid and Uninsured populations in Carrollton.

Need for the project: One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease. Components of patient education and helping patients to understand their illness, how to better manage it, how to coordinate their lifestyle choices and offering point of care testing in order to achieve optimal health outcomes are essential in population management of chronic disease

Target population: Approximately (estimated) 78,000 individuals in Denton County have Diabetes. 134,000 people have Asthma and CHF accounts for about 178 deaths per 100,000 individuals in Denton County.
Category 1 or 2 expected patient benefits: The project seeks provide chronic disease management and point of care testing services to 176 patients in DY4 and DY5.

Category 3 outcomes: The Baylor Clinic at Carrollton will be a new clinic, therefore the metric baseline and projected achievements are estimates based off of historical performance from other Baylor Clinics.

- IT-1.10: Diabetes Care: HbA1c Poor Control. Our goal is to decrease the number of patients with uncontrolled HbA1cs (> 9.0%) in DY4 to < 23.8% and < 22.6% in DY5 (or minimum of 1.2% improvement over baseline).

- IT-11.1: Diabetes Care: BP Control (< 140/80 mmHg). Our goal is to increase the number of diabetic patients in good BP control (< 140/80 mmHg) to 53.4% in DY4; 55.7% in DY5 (or minimum of 2.3% improvement over baseline).

- IT-1.13: Diabetes Care: Foot Exam. Our goal is to increase the number of diabetic patients who receive foot exams to 96.4% in DY4 and 96.8% in DY5 (or minimum of 1.4% improvement over baseline).

Project Description

The Baylor Clinic on the Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton campus, will be operational in DY4. As part of the services we will offer to the community, the clinic will house a carved out chronic disease management program to provide focused and dedicated education and care for patients with Diabetes, Cardiovascular Diseases (CVD) (i.e.: Congestive Heart Failure) and Respiratory Diseases (Asthma/Chronic Obstructive Pulmonary Disease) within a primary care setting. Specific staff, comprised of CHWs/Nurse Care Managers, would address the complex clinical and prevention needs of these patients and spend time specifically on management of these diseases. The focus of this time and education with patients would not only entail clinical counseling, but also include prevention components to focus on lifestyle issues and self-management. The other key advantage that patients will receive as part of this program is point of care testing for Diabetes (HbA1c testing and glucose testing using test strips) and Asthma (Peak Flow Meter Assessments). We believe this will overcome the barrier of patients' non-compliance with completing lab orders and any financial or transportation issues that would arise in obtaining these important lab results.

We plan to leverage the expertise and experience of both the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) and Baylor Clinics to provide staff education, develop competencies, and create protocols that will result in a complete and robust program tailored for multiple community settings. The Diabetes Health and Wellness Institute would house this staff and appropriately triage and manage providers to see patient at Baylor Clinics based on volume and demand parameters. Baylor Clinics have had previous success in managing patients with chronic disease through the creation and development of a community health worker model (CHW). These successes and competencies will be leveraged to create programs around CVD and Respiratory illnesses. The Clinic on the Carrollton campus will begin seeing patients in DY4 and the Chronic Disease program will be launched simultaneously.

Goals and Relationship to Regional Goals

The project goals for this program include: 1) creating a baseline of chronic disease management availability in the Carrollton area, 2) increasing health literacy around chronic illnesses for patients in the community, 3) teaching self-management techniques for patients to manage their chronic diseases, and 4) increasing the number of patients who are screened and monitored for their chronic diseases using point of care testing (in DY4 and DY5). The purpose for performing a project in this area is to help identify patients with chronic diseases and provide them with treatment and education in a proactive fashion so that downstream

complications can be avoided and ED/inpatient utilization can decrease. There is no program like this offered in the Carrollton area which focuses on all three major chronic diseases and the underserved population.

One of the major issues identified by the Community Health Needs Assessment for Region 9 is Chronic Disease.[176] Components of patient education and helping patients to understand their illness, how to better manage it and how to coordinate their lifestyle choices to achieve optimal health outcomes are essential in population management of chronic disease. This project coincides with this need and focuses on education, lifestyle management, proactive counseling and decision making and clinical improvement. This leads to lower ED visits for acute issues related to chronic diseases and helps patients utilize costly services in the Region. Because this program will begin in DY4, we expect to see some positive affects during the waiver period.

Challenges

Until the Baylor Clinic is operational in DY4, we will not know the disease severity and state of the patients in the community until they begin coming to the clinic. The focus and scope of the program may need to be modified depending on community need and propensity to participate. Overall, underserved patients experience multiple barriers to effectively manage their chronic illnesses. These include lack of knowledge, lack of social support, poor diets, insufficient physical activity, and limited access to care due to financial and transportation issues. By co-locating the chronic care management program within the primary care clinic, patients can receive medical care and chronic disease support at the same time. Additionally, the PCP's medical management is informed by the chronic care management team's interactions with the patient, which, in our experience, elicits new information regarding lifestyle and barriers to health. The RN/CHW model will be structured so that patient education is delivered in a format and context that is understandable and enjoyable for the patient. Lastly, the education and counseling will include lifestyle and self-management techniques so that this population can find ways to care for themselves that is relevant to their daily lives.

5-year Expected Outcome for Provider and Patients

The expected 5-year outcomes are that: 1) a chronic disease management program will be established and functional by the end of the waiver period, 2) at least 176 patients will have served by the Chronic Care Management model at the Baylor Clinic, 2) we expect to begin to improve clinical outcomes around HbA1c, foot exam completion and BP control, 3) begin point of care testing for patients in the community, 4) increase literacy in the community around chronic diseases.

Starting Point/Baseline

There is no established baseline for this project. It is a new initiative on the Baylor Medical Center at Carrollton, where we will be establishing a new primary care clinic to care for the underserved population in Carrollton/Denton County. We estimated a target population based on the Community Health Needs Assessment. 11.4% of all Dallas County residents have

[176] RHP 9 Community Health Needs Assessment

diabetes. Using this percentage, applied to the Denton County population, equates to almost 78,000 individuals in the county. Literature shows that diabetes is more prevalent in the underserved community.[177] 19.6% of Dallas County has Asthma, which equates to 134,000 people in Denton County. CHF accounts for about 178 deaths per 100,000 individuals in Denton County.[178] These statistics do not take into consideration any intersection of CHF, Asthma and Diabetes which makes individuals more complex and high risk. [179] Our project will serve approximately 176 new patients of this population.

Rationale

The prevalence of chronic disease in the underserved population. As we establish our new Baylor Clinic on the Baylor Carrollton campus, we anticipate that chronic disease prevalence and related issues will be high. In order to proactively manage these patients and their conditions, we are proposing to begin the chronic disease management program simultaneously with the clinic. Through co-locating primary care and chronic disease management services, we can improve clinical outcomes. By increasing the availability of chronic care services and utilizing a team based approach, more patients can receive focused attention for their complex needs and learn to self-manage their illnesses in an effective way. We have demonstrated statistically significant reductions in mean HbA1c measures with a CHW model currently embedded in Baylor Clinics[180]. Thus expanding the educational services to serve more diabetes patients, and beginning to serve CHF and Asthma/COPD patients is a logical next step in improving the care of the population. The Community Health Needs Assessment identified the top 5 most prevalent conditions as: stroke, diabetes, CHF, failing kidneys and AMI. This project addresses 2 of these illnesses directly and 2 indirectly, it aligns exactly with the needs of the Region and the challenges that have been identified.[181]

Project Components

There are no additional core components to this project: 2.2.2 Apply evidence-based care management model to patients identified as having high-risk health care needs. We will engage in continuous quality improvement activities throughout the duration of the project such as: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to continuously integrate the chronic disease management program into the care team as much as possible.

The Chronic Care Management metrics and milestones we have chosen focus on finding the appropriate model that would be effective in Denton County for a start-up practice. We anticipate that the model will also address multiple chronic illnesses and the complex needs of this patient population. Because this program is part of a new clinic start up plan, we structured

[181] RHP 9 Community Health Needs Assessment

our metrics to focus on increasing access, awareness and education for individuals in the region and some modest clinical improvement as well. We believe it will take time for patients to understand and epitomize good self-management behaviors and it will also take times to see marked clinical outcome improvements. We do anticipate some clinical improvement for those patients engaged in the chronic care management program for an extended period of time.

Unique community need identification number the project addresses: CN.8 Chronic Disease

How the Project significantly enhances an existing delivery system reform initiative We currently do not receive any federal funding for chronic disease education and providing services for CHF and Asthma/COPD are new to the Baylor Clinic. This project coincides with the need to focus on chronic illnesses, as they are the main drivers of health care costs in the US. Diabetes alone costs the US almost $174 billion dollars a year. [182]

Related Category 3 Outcome Measures

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Outcome Measure #1: IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (**Standalone measure**). In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes with more than 32% of the population classified as obese and at risk for developing Diabetes[183]. Traditionally, the underserved population does not have access to the necessary medications, education and supplies to manage their diabetes, thus many times patients go undiagnosed or have poor glucose control. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels. Bodenheimer, et al., found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients[184]. A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[185]. Focusing efforts on increasing improvement of good glycemic control will result diminishing in other co-morbid conditions and improve complication rates for these patients. Because patients will begin being seen I nDY4, we expect only modest improvement in HbA1c. Our projections may need to be modified depending on the severity of illness and disease state that our patients present with.

[182] http://www.diabetes.org/diabetes-basics/diabetes-statistics/

[183] RHP 9 Community Health Needs Assessment

[184] Bodenheimer, T., Lorig, K.., Holman, H., Grumbach, K. Patient Self-management of Chronic Disease in Primary Care *JAMA* (May 15, 2008).

[185] MenzinJ, Korn, J, Cohen, J, et.al Relationship between glycemic control and diabetes related hospital costs in patients with type 1 or type 1 diabetes mellitus. J Manag Care Pharm. 2010; 16(4):264-275.

Outcome Measure #2: T-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (**Standalone measure**). At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[186]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic. Again, similar to HbA1c, we expect modest improvement in BP in years DY4 andDY5 contingent upon patient participation in the clinic and chronic disease program. Our primary goal will be to have patients come in for basic services and chronic disease education.

Outcome Measure #3: IT-1.13 Diabetes care Foot exam- NQF 0056 (**Non- standalone measure**). An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of patient education session. This will increase the rate of screening and allow providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues.. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation[187].

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. This model computes separate values for health care system, individual and community impacts.

Baylor Medical Center at Carrollton defined the population that will be directly impacted by the project as underserved patients who have Diabetes, Asthma, and/or CHF that are in need of education and treatment. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this project will increase the patient's ability to self-manage her illness(es) and maintain her health rather than relying on the physician or ED to manage her conditions. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe, when a person is positively impacted, his propensity to understand his illness, share this knowledge with others and help spread health literacy increases. Patients learn to manage their illnesses and escalations themselves rather than relying on expensive resources such as the ED.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring

criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.2.2 – Expand Chronic Care Management Model - Create Chronic Disease management and Prevention Program

RHP Project Identifier: 121790303.2.1
Performing Provider Name/TIP: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Recognized for comprehensive services in heart and vascular care, diagnostic and interventional imaging, women's services, neonatal intensive care, sleep medicine, digestive disease, family medicine, and physical medicine and rehabilitation, Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): The project purpose is to provide focused education and point of care testing for underserved patients who have diabetes, CVD and/or Respiratory disease that are in need of education, clinical management and training within a primary care setting. We will co-locate primary care and chronic disease management services to improve clinical outcomes.

New v. existing initiative: This project is new because it will provide CHF and Asthma education and point of care testing, all which have not been done before. We have some diabetes education in our Clinics but not a formal focused program for the Medicaid/Uninsured patients.

Need for the project: One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease. Components of patient education and helping patients to understand their illness, how to better manage it, how to coordinate their lifestyle choices and offering point of care testing in order to achieve optimal health outcomes are essential in population management of chronic disease

Target population: Approximately 275,000 individuals in Dallas county have Diabetes. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. The underserved segment of this population is who we will target. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide chronic disease education and point of care testing for 671 patients in the Garland area.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period.

- IT-1.10: Diabetes Care: HbA1c Poor Control. Our goal is to decrease the number of patients with uncontrolled HbA1cs (> 9.0%) from 12.7% currently to 11.5% in DY5 (or 1.2% improvement over baseline).

- IT-11.1: Diabetes Care: BP Control (< 140/80 mmHg). Our goal is to increase the number of diabetic patients in good BP control (< 140/80 mmHg) from 47.4% to 54.9% in DY5 (or 7.5% improvement over baseline).

- IT-1.13: Diabetes Care: Foot Exam. Our goal is to increase the number of diabetic patients who receive foot exams from 95.6% currently to 96.8% in DY5 (or 1.2% improvement over baseline)..

Project Description

The Baylor Clinic on the Baylor Medical Center at Garland campus, would house a carved out chronic disease management program to provide focused and dedicated education and care for patients (including Medicaid/Uninsured) with Diabetes, Cardiovascular Diseases (CVD) (i.e.: Congestive Heart Failure) and Respiratory Diseases (Asthma/Chronic Obstructive Pulmonary Disease) within a primary care setting. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients .Specific staff, comprised of CHWs and Nurse Care Managers, would address the complex clinical and prevention needs of these patients and spend time specifically on management of these diseases. The focus of this time and education with patients would not only entail clinical counseling, but also include prevention components to focus on lifestyle issues and self-management. The other key advantage that patients will receive as part of this program is point of care testing for Diabetes (HbA1c testing and glucose testing using test strips) and Asthma (Peak Flow Meter Assessments). We believe this will overcome the barrier of patients' non-compliance with completing lab orders and any financial or transportation issues that would arise in obtaining these important lab results.

We plan to leverage the expertise and experience of both the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) and Baylor Clinics to provide staff education, develop competencies, and create protocols that will result in a complete and robust program tailored for multiple community settings. The Diabetes Health and Wellness Institute would house this staff and appropriately triage and manage providers to see patient at Baylor Clinics based on volume and demand parameters. Baylor Clinics have had previous success in managing patients with chronic disease through the creation and development of a community health worker model (CHW). These successes/competencies will be leveraged to create programs around CVD and Respiratory illnesses.

Goals and Relationship to Regional Goals

The project goals for this program include: 1) increasing health literacy around chronic illnesses for patients in the community, 2) educate and teach self-management techniques for patients to manage their chronic diseases, 3) augmenting RN care managers with CHWs to serve a

greater number of patient through a carved out, focused care model, 4) increasing the number of patients who are screened and monitored for their chronic diseases using point of care testing and 5) increase education for patients with CHF and Asthma/COPD (2 disease states previously not offered). The purpose for a project in this area is to help identify patients with chronic diseases and provide them with treatment and education in a proactive fashion so that downstream complications can be avoided and ED/inpatient utilization can decrease.

One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease[188]. Components of patient education and helping patients to understand their illness, how to better manage it and how to coordinate their lifestyle choices to achieve optimal health outcomes are essential in population management of chronic disease. This project coincides with this need and focuses on education, lifestyle management, proactive counseling and decision making and clinical improvement. This leads to lower ED visits for acute issues related to chronic diseases and helps patients utilize costly services in the Region.

Challenges

Underserved patients experience multiple barriers to effectively manage their chronic illnesses. These include lack of knowledge, lack of social support, poor diets, insufficient physical activity, and limited access to care due to financial and transportation issues. By co-locating the chronic care management program within the primary care clinic, patients can receive medical care and chronic disease support at the same time. Additionally, the PCP's medical management is informed by the chronic care management team's interactions with the patient, which, in our experience, elicits new information regarding lifestyle and barriers to health. The RN/CHW model will be structured so that patient education is delivered in a format and context that is understandable and enjoyable for the patient. Lastly, the education and counseling will include lifestyle and self-management techniques so that this population can find ways to care for themselves that is relevant to their daily lives.

5-year Expected Outcome for Provider and Patients

Expected 5-year outcomes include: 1) at least 671 patients will have served by the Chronic Care Management model at the Baylor Clinic, 2) better clinical outcomes around HbA1c, foot exam completion and BP control, 3) more patients in the community will have had a point of care test completed for their diabetes or asthma which will provide real time results and opportunities for improvement, 4) increased literacy in the Garland community around chronic diseases and 5) decreased rates of avoidable/unnecessary complications (i.e. amputations) due to chronic diseases. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients.

Starting Point/Baseline

Currently, the Baylor Clinic on the Baylor Medical Center at Garland offers a limited program focused on diabetes education. Of the patients enrolled in the program, approximately 13% of clinic patients have an HbA1c > 9.0. This baseline is not directly comparable to the proposed

[188] RHP 9 Community Health Needs Assessment

project for chronic care management because we will be including CHF and Asthma/COPD patients as well as part of the initiative. We estimated a target population based on the Community Health Needs Assessment, 11.4% of all Dallas County residents have diabetes, this equates to almost 275,000 individuals in the county. Literature shows that diabetes is more prevalent in the underserved community[189]. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. These statistics do not take into consideration any intersection of CHF, Asthma and Diabetes which makes individuals more complex and high risk. [190] Our project will serve approximately 671 new patients of this population.

Rationale

We selected this project option because of the prevalence of chronic disease in the underserved population. Through co-locating primary care, behavioral health and chronic disease management services, we can improve clinical outcomes. By increasing the availability of chronic care services and utilizing a team based approach, more patients can receive focused attention for their complex needs and learn to self-manage their illnesses in an effective way. We have demonstrated statistically significant reductions in mean HbA1c measures with a CHW model currently embedded in Baylor Clinics[191]. Thus expanding the educational services to serve more diabetes patients, and beginning to serve CHF and Asthma/COPD patients is a logical next step in improving the care of the population. The Community Health Needs Assessment identified the top 5 most prevalent conditions as: stroke, diabetes, CHF, failing kidneys and AMI. This project addresses 2 of these directly and 2 indirectly, it aligns exactly with the needs of the Region and the challenges that have been identified.[192]

Project Components

We will engage in continuous quality improvement activities throughout the project's duration such as: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to continuously integrate the chronic disease management program into the care team as much as possible.

Reasons for selecting outcome measures

The Chronic Care Management metrics and milestones we have chosen focus on finding the appropriate model that would be effective in Dallas County that also addresses multiple chronic illnesses. Based on the complexities of the underserved population, we structured our metrics to focus on increasing access, awareness and education for individuals in the region and in the latter years including metrics around increased compliance to recommended clinical protocols. We believe it will take time for patients to understand and epitomize good self-management

[192] RHP 9 Community Health Needs Assessment

behaviors and it will also take times to see marked clinical outcome improvements. We do anticipate some clinical improvement for those patients that have been engaged in the chronic care management program for an extended period of time. We have not historically completed programs for CHF and Asthma/COPD and will use this opportunity to create a continuous improvement environment where these programs can be refined as we get more experience.

Unique community need identification number the project addresses: CN.8 Chronic Disease

How the Project significantly enhances an existing delivery system reform initiative

We currently do not receive any federal funding for chronic disease education and providing services for CHF and Asthma/COPD are new to the Baylor Clinic. This project coincides with the need to focus on chronic illnesses, as they are the main drivers of health care costs in the US. Diabetes alone costs the US almost $174 billion dollars a year. [193]

Related Category 3 Outcome Measures

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Outcome Measure #1: IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (**Standalone measure**). In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes with more than 32% of the population classified as obese and at risk for developing Diabetes[194]. Traditionally, the underserved population does not have access to the necessary medications, education and supplies to manage their diabetes, thus many times patients go undiagnosed or have poor glucose control. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels Bodenheimer, et al., found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients[195]. A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[196]. Focusing efforts on increasing improvement of good glycemic control will result diminishing in other co-morbid conditions and improve complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

[193] http://www.diabetes.org/diabetes-basics/diabetes-statistics/

[194] RHP 9 Community Health Needs Assessment

[195] Bodenheimer, T., Lorig, K.., Holman, H., Grumbach, K. Patient Self-management of Chronic Disease in Primary Care *JAMA* (May 15, 2008).

[196] MenzinJ, Korn, J, Cohen, J, et.al Relationship between glycemic control and diabetes related hospital costs in patients with type 1 or type 1 diabetes mellitus. J Manag Care Pharm. 2010; 16(4):264-275.

Outcome Measure #2: T-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (**Standalone measure**). At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[197]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic. Again, similar to HbA1c, we expect modest improvement in BP in years DY4 andDY5 contingent upon patient participation in the clinic and chronic disease program. Our primary goal will be to have patients come in for basic services and chronic disease education.

Outcome Measure #3: IT-1.13 Diabetes care Foot exam- NQF 0056 (**Non- standalone measure**).An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues.. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation[198]. We expect this metric is one that we can easily achieve in DY4 and DY5 when the clinic is operational.

Relationship to other Projects

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This chronic care management project is related because: 1) services will be co-located and 2) the chronic care team will be integrated with the primary care team to facilitate complete care and efficiency for the patient.

121790303.2.3- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment
The project involving developing care management functions to integrate primary and behavioral health needs of individuals is related to this project of chronic care management because often times patients have co-occurring chronic disease and mental health issues which require attention. These programs can cross-refer depending on the patient's needs.

Plan for Learning Collaborative:

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to CQI and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced projects and outcomes by computing the total value of Category 3 outcomes connected to each project. This model computes separate values for health care system, individual and the community impacts. ***Baylor Medical Center at Garland*** defined the population that will be directly impacted by the project as underserved patients who have Diabetes, Asthma, and/or CHF that are in need of education and treatment. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe when a person is positively impacted, she increases her ability to self-manage her illness(es) and maintain her health rather than relying on the physician or ED to manage her conditions. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We

believe, when patients understand their illness, they share knowledge with others and help spread health literacy increases. Patients learn to manage their illnesses and escalations themselves rather than relying on expensive resources such as the ED.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.19.1 – Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals-Behavioral Health Counseling, Screening, Treatment

RHP Project Identifier: 121790303.2.2
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Recognized for comprehensive services in heart and vascular care, diagnostic and interventional imaging, women's services, neonatal intensive care, sleep medicine, digestive disease, family medicine, and physical medicine and rehabilitation, Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): This project will co-locate and integrate outpatient behavioral health services using an LCSW to provide counseling services. Screenings for depression, substance abuse and anxiety will also be an integral part of the program. This is a new project that has not been done before. It will serve the BH needs of the Uninsured/Medicaid population.

Need for the project: The Community Needs Health Assessment identified behavioral and mental health issues as a large unmet need and also identified as the most difficult to access services in the Region. Behavioral Health issues are an identified impediment to clinical adherence and when addressed can create a material impact on clinical outcomes. Behavioral Health issues are especially prevalent in underserved populations.

Target population: Underserved (Medicaid and uninsured) population in the Garland area with behavioral health issues.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide screening and interventions to 671 patients in the Garland area. Approximately 85-90% of these patients will be Medicaid/Uninsured.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends /literature based metrics that had material impact on patients in a 2-3 year time period.

- IT-11.1: Improvement in Clinical Indicator in Identified Disparity Group: Improvement in Diabetes Metrics (HbA1c, LDL, BP) for disparate group of uninsured/Medicaid patients with an underlying BH issue. Our goal is to have 5% of patients in DY3 achieve improvement in Diabetes Metrics (HbA1c, LDL BP), 10% in DY4 and 15% in DY5.
- IT-11.3: Improve utilization rates of clinical preventive services in target population with identified disparity: Improve utilization of BH services for patients who have been

screened/identifed and diagnosed with an underlying BH issue. Disparate population is underserved population with BH issue. Our goal is to increase the patients who engage in BH treatment rates from 10% in DY3 to 20% in DY5.

Project Description

This project will co-locate and integrate behavioral health services into the outpatient primary care setting. The model that we aim to develop would consist of providing a LCSW to provide basic counseling services to address behavioral health needs such as: anxiety, depression, and substance abuse issues. The screening tools we plan to use are evidence based and will most likely include: PHQ2 or 9, GAD-7 and alcohol and substance abuse screeners. Additionally, the LCSW would have the support of a Community Health Worker (CHW) to help with the screening and referral processes. The training for the CHWs , LCSWs and model development would occur at the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) where the competencies and expertise would be created. From there, this staff can be triaged to clinics and community locations to provide behavioral health services. The behavioral health program would require that the LCSW and CHW to work together with the primary care team to: 1) identify the patients who have behavioral health issues, 2) coordinate the patient's care and appointments to fit both the behavioral health and primary care appointment in the same visit and 3) help the primary care team to identify those patients whose behavioral health issues are impeding the management of their acute/chronic disease management models. We anticipate that approximately 85-90% of patients will be Uninsured/Medicaid.

Goals and Relationship to Regional Goals

The goals of this project are to increase the baseline of behavioral health services provided and screenings conducted to the underserved population in Dallas County received in an outpatient setting. By co-locating the behavioral health service with a patient's PCMH, we anticipate that compliance and adherence to attending behavioral health appointments will increase. Through increased screening, awareness and intervention, we also anticipate that behavioral health issues such as anxiety, depression and substance abuse will be proactively identified and addressed in order to allow the clinician and patient to focus on more acute/chronic illnesses that require protocol adherence. The derivative goal of this would also be to decrease ED visits related to behavioral health issues that are manageable in the outpatient setting. We believe by treating the underlying barriers associated with behavioral health, this will result in better health outcomes for this population. The RHP 9 Community Needs Health Assessment identified behavioral and mental health issues are a large unmet need in most counties within the region and also identified as the most difficult to access services in the Region. There were three regional priorities around behavioral health including integrating behavioral health with primary care and addressing behavioral health in other settings. More than 10% o f Dallas County residents "binge drink" and there are more than 10 deaths per 100,000 related to suicide[199]. Only 19% of patients receive behavioral health and primary care services in the same

[199] Healthy People North Texas: http://www.healthyntexas.org

setting[200]. The most compelling statistic is that 100% of the 10 most frequently admitted patients had a co-occurring behavioral health diagnosis. The aforementioned statistics make a strong and significant case that basic behavioral health services can achieve "quick wins" for this underserved population. This project is directly aligned with the Regional needs and is positioned to help facilitate care related to substance abuse, anxiety and depression[201].

Challenges

The challenges with behavioral health initiatives are that identification of patients and willingness of those patients to participate in a formal program do not coincide. There is a stigma associated with receiving counseling or behavioral health services which makes it difficult for providers to identify patients that have these underlying behavioral health issues and even more difficult for providers to get patients to come in for these types of appointments. In the community, patients do not see their behavioral health issues as a medical condition, thus the problems are often ignored and results in these patients using the ED for their acute behavioral health escalations. While this program would not focus on serious psychiatric issues such as schizophrenia or bipolar disorders, identifying depression or anxiety can have a significant impact on the patient's propensity to comply with medication and clinical recommendations/protocols. The way we plan to address the challenges mentioned above is through providing these services in a non-threatening way by individuals (CHWs/LCSWs) that come from the community they are serving. By using CHWs or LCSWs over physicians or other higher level providers, this should put the patient at ease. The program will also be presented in a counseling type environment rather than a psychiatric evaluation environment. Lastly, we will make behavioral health screenings a routine part of most primary care visits so that the assessments coincide with the patient's typical care.

5-year Expected Outcome for Provider and Patients

The 5 year expected outcome is that at least 20% of the total unduplicated patients (approximately 671 patients) will receive behavioral health services at the Baylor Clinic at Garland. By identifying underlying behavioral health issues, acute and chronic medical issues can be addressed and compliance/adherence to clinical protocols should increase as well.

Starting Point/Baseline

There is no baseline for this project because there are no initiatives for behavioral health that are offered or ever have been at the Baylor Clinic located on the Baylor Medical Center at Garland. This is a brand new program that will be administered to Clinic patients. We do know that the target population in the Dallas county area is over 200,000 underserved individuals who suffer from a mental illness. We calculated this number taking the uninsured population in Dallas County (872,000)[202] and a 2011 statistic taken from the Centers for Disease Control and Prevention that found 23% of uninsured patients suffer from a mental illness.[203]

Rationale

The reasons for selecting this project option are because behavioral health was not only identified as a major regional need, but Baylor Clinics have the infrastructure to effectively manage these types of issues within its PCMH framework. Many of our patients have underlying behavioral health issues which the physicians simply do not have time to address during a typical primary care visit, this model would allow patients to receive personalized attention for their behavioral health specific issues and allow the physicians to spend time on managing clinical issues. We believe by implementing a behavioral health component as part of the PCMH we have established, that patients will have improved overall health outcomes and providers will have greater satisfaction because these services will be performed by individuals who have expertise in managing behavioral health. Lastly, adding a behavioral health component to our primary care team will allow for cross communication between providers to understand all of the complex needs that are prevalent in this particular population.

Project Components

This behavioral health project has many components, all of which are addressed below:

a. Conduct data matching to identify individuals with co-occurring disorders who are:
   - not receiving routine primary care-*Patients who enter in to the behavioral health program will be automatically part of a PCMH*
   - not receiving specialty care according to professionally accepted practice guidelines: *We will track this metric as part of our specialty care project 1.9.2*
   - over-utilizing ER services based on analysis of comparative data on other populations: *This is a metric that we already track and will continue to do so*
   - over-utilizing crisis response services. *This particular factor may be difficult to gather data on and is not typically a data point we collect*
   - Becoming involved with the criminal justice system due to uncontrolled/unmanaged symptoms. *This factor may be difficult to gather data on-not typically collected*

b. Review chronic care management best practices such as Wagner's Chronic Care Model and select practices compatible with organizational readiness for adoption and implementation. *We plan to review the most effective models that address both chronic care and behavioral health to determine which model would easily address the intersection of both programs*

c. Identification of BH case managers and disease care managers to receive assignment of these individuals: We plan on hiring LCSWs and CHWs to act as BH care managers

d. Develop protocols for coordinating care; identify community resources and services available for supporting people with co-occurring disorders: As part of identifying which patients would be eligible and appropriate for this BH program, we will be developing clinical protocols to identify patients and coordinate care within the Baylor Clinic PCMH

e. Identify and implement specific disease management guidelines for high prevalence disorders. *We plan to address this criteria through our Chronic Care Management project (2.2.1- Expand Chronic Care Management Models)*
f. Train staff in protocols and guidelines. *All staff will be made aware of this program and be trained on scheduling and identifying patients who could be part of this BH program*
g. Develop registries to track client outcomes. *We currently have a robust EHR to track patient clinical metrics and measures, it would be redundant and inefficient to create a separate registry to track outcomes for this project. We will track outcomes in the current EHR*
h. Review the intervention(s) impact on quality of care and integration of care and identify "lessons learned," opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. *As part of our monthly review of project status, this will be included as will review of the other DSRIP projects the Baylor Clinic will be engaged in. We will focus on the key challenges associated with expansion and determine how and if the BH needs to be scaled to meet patient needs.*

Reasons for Selecting Outcome Measures
The milestones and metrics chosen are focused on increasing volumes of patients seen. In order to be effective, patients will need to attend their appointments and be compliant with the recommended guidelines for behavioral health issues and subsequent medical issues. To achieve the proposed metrics and milestones all of the other DSRIP projects will have to coordinate and synchronize. This will be advantageous to the Region, as it will create synergy and a complete plan of care for the patients in the target population. In the Planning Protocol, there were no options for Improvement Milestones that were directly applicable to this Behavioral Health program. Many of the metrics were focused on chronic disease, which we have an entire separate DSRIP project dedicated to. Thus, we created two customizable improvement milestones that focus on 1) increasing patient volumes (capturing eligible patients) and 2) improving rates of screening for anxiety, depression and substance abuse.

Unique community need identification number the project addresses:

- CN.5- Behavioral Health
- CN.6-Behavioral Health and Primary Care

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funding and is a brand new initiative. There is currently no outpatient based behavioral health program offered to the underserved population at the Baylor Clinic at the Baylor Medical Center at Garland. This project will provide a low cost, effective intervention to those patients with behavioral health needs in a setting that is manageable for providers to identify potential escalation points.

Related Category 3 Outcome Measures

Category 3 metrics for this project were identified using literature only. Baylor has no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (**Standalone measure**). We plan to measure the impact of diabetes management and control for patients who have enrolled in the proposed behavioral health program. A recent study conducted in early 2012, by Jeffery Johnson, et al. showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression[204]. Depression is associated with poorer self-care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.

Numerator: Number of patients with an improved Diabetes Percent of Opportunities Achieved (POA) improvement (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter

Denominator: Total number of patients with a Behavioral Health intervention/encounter

Our Baylor Clinics currently track the Diabetes Percent of Opportunities Achieved (POA) for all patients with Diabetes. This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their diabetic patients than in the prior reporting period.

For an illustrative example: For Diabetes- there are 3 opportunities (i.e. metrics) per patient (1) LDL < 100 (2) A1c < 8 and (3) BP < 130/80 mmHg. The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 76% achievement.

[204] Johnson, JA, Sayah, FA, et.al. Controlled trial of a collaborative primary care team model for patients with diabetes and depression: rationale and design for a comprehensive evaluation. BMC Health Services Research. 2012, 12:358

However, adding behavioral health as a subset of measurement for this patient population may change the actual improvement that is attainable. Because this is a new program, we do not have any historical data on the actual Diabetes improvement for those patients who receive a behavioral health intervention. We only have literature which has shown improvement in Diabetes with interventions related to depression. Thus, the improvement targets we have listed for Category 3 may differ as we implement the program.

Outcome Measure #2: IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (**Non-standalone measure**). We plan to focus on the treatment component of this metric, defining treatment as those patients who engage in the behavioral health program. We anticipate that patients who enter our Baylor Clinic and are identified as individuals who would benefit from a behavioral health intervention will have improved treatment and utilization rates.
Numerator: patients who are a Baylor Clinic patient and engage in behavioral health program
Denominator: patients who are a Baylor Clinic patient, eligible for behavioral health services
The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure differs from our customized Improvement Milestone I-X: Target Population Reached: Increase Number of patients enrolled in BH program because the Improvement Milestone is focused on increasing volumes of eligible patients. Outcome measure 11.3 takes this one step further to ensure that the patient actually engages in the behavioral health program. By qualifying "engage" as a minimum of two interventions/encounters in the last 12 months, this varies from the Improvement Milestone of just increasing volume.

Relationship to other Projects

121790303.2.2- Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program. The Chronic Care Management Model project is related because if patients have a co-occuring behavioral health issue and chronic diseases, the services are co-located and patients can be referred into both programs if necessary.

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion This behavioral health project is related to the expansion of primary care capacity project because 1) the services will be co-located and 2) the behavioral health team will be part of the overall primary care team; providing complete and efficient care for the patient.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives
Behavioral Health is pressing issue across the Region and will require collaboration and coordination between providers to manage these types of issues in a less costly, personalized setting. There are several other projects submitted by performing providers related to improving behavioral health services.

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly CQI and will advance the success of this project.

Project Valuation
Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for health care system, individual and community impacts.

Baylor Medical Center at Garland defined the population that will be directly impacted by the project as the underserved PCMH Baylor Clinic patients with an underlying behavioral health issue(s). We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe a person will increase compliance and adherence to clinical protocols and when their satisfaction increases so will self-management of their illnesses. To determine the value to the community, we concluded that, on a scale of 1 – 5, the value of this project is a ***4.*** We believe, when a person is positively impacted, their productivity in the community increases as mentioned in the Community Health Needs Assessment 25% of the population reported lost work days due to a mental health issue. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative

score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program – Care Connect

RHP Project Identifier: 121790303.2.3
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Recognized for comprehensive services in heart and vascular care, diagnostic and interventional imaging, women's services, neonatal intensive care, sleep medicine, digestive disease, family medicine, and physical medicine and rehabilitation, Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): This project will identify and connect underserved patients in the hospital to a PCP/PCMH, create a multi-disciplinary care plan for frequently admitted patients and provide comprehensive follow up calls to patients to ensure they have an appointment and transportation to get to it. This project would be an expansion of Care Connect at Baylor Garland. We will be adding additional staff to serve more Medicaid/Uninsured patients add coverage on nights and weekends and create Care Plans for high risk patients.

Need for the project: Connecting patients to a PCP/PCMH will reduce ED utilization and provide outpatient services for complex patients. Over-utilization of the ED was identified as a Regional issue.

Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH who come to the ED. Approximately 85% of new patients seen in this program will be Medicaid/Uninsured.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 3600 new patients from the community.

Category 3 outcomes: Category 3 outcomes for this project are from 2 different domains the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

- IT-5.1: Improved Cost Savings. Our goal is to increase cost savings of healthcare utilization (total cost of care in one year) of patients who have been connected to a PCP/PCMH appointment from 15% in DY3 to 25% in DY5. .
- IT-9.2: ED Appropriate Utilization. Our goal is to decrease all ED visits (including ACSC) from 25% in DY3 to 35% in DY5 and targeted conditions ED utilization (CHF, Diabetes, ESRD, CVD/Hypertension, BH/SA, COPD, Asthma) from 10% in DY3 to 20% in DY5. We will be excluding pediatric emergency visits as part of this metric measurement because

Baylor Medical Center at Garland does not see a large volume of pediatric patients in the ED.

Project Description

This project aims to create a fluid care navigation program located at Baylor Medical Center at Garland Emergency Department for patients (including Medicaid/Uninsured) who are identified (or proclaim) to not have a primary care physician and/or patient centered medical home to address their post-acute care needs. Approximately 85% of new patients enrolled in this program will be Medicaid/Uninsured. By having staff physically located in these locations, patients can receive real time assistance in finding a provider and ensuring they are connected with the appropriate resources they would require once discharged home. We will include staff coverage on the weekends as well to ensure that patients are able to be seen and connected to resources 7 days/week. Additionally, in order to close the loop, staff will follow-up with patients to make sure they have an appointment and that they attend their appointment. The staff will also be responsible for ensuring that other barriers such as transportation are addressed and patients are able to attend their follow-up visits. The Care Connect staff will receive e-mail notifications any time a patient revisits the hospital, at this time staff will proactively visit with the patient to ensure the patient is able to access their PCP/PCMH appointment and/or recommended community resource(s). Care plans will be developed for patients with high hospital utilization (especially patients with frequent emergency department visits) and complex needs. Care plans will include involvement with Social Work Supervisor, Hospital Medical Director and other hospital staff. Patients with care plans will be contacted as often as needed to ensure continuity of the care plan.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to connect a greater number of patients to a PCP/PCMH in the Garland community, 2) ensure the patients have the resources they need to care for themselves post discharge, 3) keep patients out of the ED and 4) create a care plan for high risk patients which ensures that the patient is receiving the follow-up care they need and are identified by staff when they readmit to the hospital.

One of the major goals for the region is to reduce ED utilization and readmissions. This project focuses on and emphasizes both of these components. The entire impetus of the project is focused on Care Coordination and ensuring that patients are triaged to appropriate community and outpatient based resources. This is a strategy to decrease overall spending on health care in the region and help more patients connect to the essential primary care needed to maintain their health.

Challenges

Challenges with the underserved population almost always route back to the lack of continuity of care across the continuum. Because of their financial, time and resource constraints, this population often find a temporary fix to their health issue and once discharged from the hospital do not receive the care they need to stay healthy. If a patient is given an appointment

post discharge, they may have issues with transportation and other barriers that impede their access to care. Typically there is no follow-up to ensure the patient knows when their appointment is and if they actually went. This program aims to address these issues by identifying patients who do not have a PCP/PCMH, finding one for them, ensuring they have the resources they need to keep their appointment and then following up with the patient.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 3600 patients connected to a PCP, PCMH or community resource, 2) 35% of these patients will have confirmed appointments within 14 days post-discharge. We expect that there will be fewer ED visits and readmissions for this population that was connected through this program and will experience overall improved health outcomes due to receiving appropriate and adequate post-acute care.

Starting Point/Baseline

The baseline for this project at Baylor Medical Center at Garland is 849 patients served by the program from November 2011 to July 2012 . This program is still relatively new at Baylor Medical Center at Garland. The purpose of this project is to expand the scope and coverage of this project for more patients. We anticipate that the targeted population for the entire region is approximately 260,000 patients. This is calculated by taking the average rate of patients who are uninsured that do not have a PCMH/PCP (30%) multiplied by the total number of uninsured in Dallas (36% of the population).[205]

Rationale

We selected this project because it is a low cost, highly effective way to help promote the continuity of care for the underserved population. Utilizing CHWs and social work as the main staff involved in this project, these individuals are connected to the community and understand patients' complex needs. This project helps patients that do not have a PCP/PCMH connect to one and then also offers the continuous improvement piece that is often missing in these types of initiatives. We selected this project for Baylor Medical Center at Garland because we have seen demonstrated results in the time the project has been implemented at Baylor Garland. The program has reduced readmissions and lowered ED utilization. The other attractive component this project are the multidisciplinary care plans that will be developed for the highest risk patients to identify these individuals and hone in on triggers that cause them to (re)admit. We believe that this intervention is an effective way for staff to be involved with the patient at a grassroots level and allow patients to feel that they have someone responsible for their ongoing care and navigation needs.

Project Components

This project has multiple components from the protocol, all of which are listed and addressed below:

[205] Census Quick Facts: http://quickfacts.census.gov/qfd/states/48/48439.html

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency: *This is a core part of our program, we will be focusing on all ED patients that are identified to not have a PCP/PCMH. Our Care Plans are developed for patients who are frequent ED utilizers as well. Lastly, our CHWs that we will be hiring come directly from the communities they serve so they understand the challenges/issues with the patients that come from that community.*

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. *This project will primarily be using CHWs and Social Workers to help navigate the patients and manage their care.*

c) Connect patients to primary and preventive care. *The impetus of this program is focused on connecting patients to PCP/PCMH*

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management. *Through connecting patients to a Baylor Clinic PCMH, these services for chronic care management will also be addressed.*

e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures

The milestones and metrics that we chose are directly related to two of the goals identified by the region: 1) need for more care coordination and 2) overuse of ED services. The metrics we have in place increase the number of the target population served over the Waiver period and emphasize the connection rate to a PCP/PCMH. In addition, we have added a metric that creates regular reports that show comparative analyses year over year of the program. We believe by running detailed reports on what services were provided and how these coincide with the needs of the community, will allow for maximum effectiveness and positive outcomes of the project. These metrics directly impact the health and well-being of the patients served and insure continuity in their care.

Unique community need identification number the project addresses: CN.12- ED Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any federal funds and is a new initiative. It is focused on reducing high cost ED utilization and connects patients with a PCP/PCMH to avoid subsequent ED visits. This is a low cost, highly effective way to keep patients in appropriate care settings.

Related Category 3 Outcome Measures

The Standalone and Non-standalone metrics come from 2 different domains because the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

Outcome Measure #1: IT-9.2 ED appropriate utilization (**Standalone measure**). According to the Community Health Needs Assessment of Region 9, 68% of the ED visits in the region were for non-emergent situations that could have been handled in the primary care/outpatient settings. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED[206].

Outcome Measure #2: IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (**Non- standalone measure).** Financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[207]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region. On a more global level, AHRQ found that the average cost in 2006 for an uninsured patient stay in the hospital cost about $19,400. There is definite room for opportunity to produce cost savings for this target population[208].

Relationship to other Projects

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

The navigation program is located in the hospital and will facilitate the connection of patients to the Baylor Clinic that are identified by the staff to not have a PCP/PCMH.

Related Category 4 Population-focused improvements

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations:

[206] Gawande, A. The hot spotters: can we lower medical costs by giving the neediest patients better care? The New Yorker. (2011).
[207] Texas Medical Association: http://www.texmed.org
[208] AHRQ: http://www.ahrq.gov

The thought here is that if patients that are identified in the ED setting to not have a PCP/PCMH or other adequate resources, that once connected they will have lower utilization of the hospital. This project does not necessarily improve conditions while patients are in the hospital. RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.7, RD-1.8, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7, RD-4.1, RD-4.2, RD-5.1

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Care Coordination models require an initial connection but also require resources to triage patients to. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the Region's responsibility to ensure there are outlets for these patients to receive the care they need. Care Navigation programs serve the patients located in the specific EDs/inpatient units of the performing providers and thus do not duplicate patients on a per visit basis. While our geographies overlap, these programs are localized to individual hospitals. There are 12 RHP 9 projects related to patient navigation (including Baylor's projects). The projects are as follows:

Performing Provider	Unique Project
Baylor Medical Center at Irving	121776204.2.3
Baylor University Medical Center	139485012.2.3
Children's Medical Center	138910807.2.3

Methodist Dallas Medical Center	135032405.2.1
Methodist Richardson Medical Center	209345201.2.1
Parkland Health & Hospital System	127295703.2.7
Texas Health Presbyterian – Denton	020967801.2.1
Texas Health Presbyterian – Kaufman	094140302.2.1
University of Texas Southwestern – Faculty	126686802.2.4
Univeristy of Texas Southwestern – Hospital	175287501.2.1

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 3 Regional Healthcare Partnerships. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we

have priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. This methodology is consistent with our approach in our other RHPs. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Garland defined the population that will be directly impacted by the project as ***underserved individuals in the Garland and Dallas County area*** that access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3We believe this to be the correct number because, when a person is positively impacted, their ability to maintain their health and address their complex health needs will be addressed. People will receive the procedures, diagnostics, etc. that they previously were unable to afford or could not have access to. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3 .***We believe this to be the correct number because, when a person is positively impacted, their clinical exacerbations are lessened and they incur less costly procedures and surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.12.2 – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs- Vulnerable Patient Network (Home Visit Program)

RHP Project Identifier: 121790303.2.4 – Pass 2
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Recognized for comprehensive services in heart and vascular care, diagnostic and interventional imaging, women's services, neonatal intensive care, sleep medicine, digestive disease, family medicine, and physical medicine and rehabilitation, Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): This project will provide in-home visits to the highest risk uninsured and Medicaid patients. Risk is defined by patient propensity of complications, (re)admissions, downstream healthcare utilization and costs within the parameters of socioeconomic and clinical risk indicators. The team will be led by an APRN overseen by a Medical Director and augmented with a Social Worker, LVN and Care Coordinator who will have overall oversight and responsibility of continuity of care for the patients in the program. Services such as examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education will be available in the patient's home. This project is a new initiative at Baylor Medical Center at Garland.

Need for the project: High risk and complex patients that need intensive management will receive care in their homes to address acute and chronic needs. This should facilitate fewer visits to the ED, greater compliance to clinical protocols and regimens and create improved quality outcomes.

Target population: The top 5% highest risk patients of the 872,000 uninsured and Medicaid population in Dallas County that have at least one of the following characteristics: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide care to 50 high risk patients.

Category 3 outcomes: Category 3 outcomes for this project focus on identifying and improving impediments to patient care in order to increase compliance and better outcomes.

- IT-10.1: Quality of Life. Our goal is to increase the mean score (from time of enrollment to current survey) on QOL assessments by 7% by DY5 for patients in the program for at least 6 months.

- IT-10.2: Activities of Daily Living. Our goal is to increase the mean score (from time of enrollment to current survey) on ADL assessments by 7% by DY5 for patients in the program for at least 6 months.

Project Description

The Vulnerable Patient Network (VPN) program provides home visits to the highest risk (clinically, economically and socially) and vulnerable Medicaid and uninsured patients. Using a combination of the Hot Spotting model developed by Dr. Jeffery Brenner of the Camden Coalition of Healthcare Providers[209] and a validated risk stratification tool, we will stratify and identify the top 5% of high risk patients in the Medicaid and Uninsured population. Qualifiers for enrollment in this program include patient characteristics that include but are not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting. A multidisciplinary team comprised of an advanced nurse practitioner (APRN) and LVN to see patients in the home and provide acute, primary and chronic care. In addition, social workers will be part of the team to address barriers to care and any social issues. Care Coordinators will also be part of this team to facilitate coordination and continuity of care for patients and have high level oversight for patients; bringing together the necessary components of care for these complex patients. Lastly, a Medical Director will have management over the entire project. A full spectrum of services will be available in the patient home ranging from examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education.

Goals and Relationship to Regional Goals

The goals for this project are: 1) Increase patients who receive primary care, 2) Overcome access issues for high risk patients, 3) Address acute care issues in the patient's home rather than the Emergency Department, 4) Increase patient compliance and adherence to regimens, 5) Decrease barriers to care around receiving medications and overall care, 6) Increase contact rate with provider for high risk patients and 7) Increase medication reconciliation frequency.

Two of the goals for the region include increasing healthcare capacity and decreasing ED utilization and readmissions. This project increases access to care for those high risk patients who are unable or unwilling to be seen in primary care office. It creates additional points of care for patients to receive care and improve compliance and clinical outcomes. Patients who have multiple chronic diseases and unable to go to appointments can have their conditions proactively managed in their homes. Together long term disease management and avoidance

[209] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011.

of exacerbations lead to better clinical outcomes, lower ED utilization, lower costs and better overall patient health. According to the Community Needs Assessment, the conditions with the highest ED visit volumes for the Medicaid and uninsured population were: diabetes, CHF and stroke. With proper and consistent management, these conditions are manageable.[210] The top 10 utilizers of health care services in the region accumulated $26 million in costs.[211] These patients would be candidates for this Home Visit program, identifying them through the "hot spotting" methodology[212] and proactively managing their conditions. This program will help to improve outcomes of chronic diseases and related complications by proactively managing the patient in a setting that is convenient and comfortable for them, hopefully increasing compliance to treatment protocols and medication adherence.

Challenges

High risk (clinical and socioeconomic) uninsured and underinsured patients often have multiple co-morbidities, issues with access and lack of resources to care for themselves. These patients, due to financial and other constraints cannot afford medications, transportation to appointments and may be physically incapable of leaving their homes to receive care. These are the patients that end up having their clinical conditions escalate and end up in the Emergency Department because the lack of adequate and timely primary care. This program would remove barriers to access by providing a full range of clinical and social services high risk patients need in their homes. This also allows the care team to physically survey the patient's living conditions and find inhibitors to help the patient overcome these issues to better care of themselves.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) provide home care to a minimum of 50 patients, 2) improve mean quality of life scores by a 7% over baseline for patients enrolled in VPN for at least 6 months, 3) improve Activities of Daily Living mean scores by 7% over baseline for patient enrolled in VPN for at least 6 months and create a robust, multidisciplinary care team that manages everything for the patient from scheduling appointments, receiving labs/medications to addressing social issues and helping the patient to overcome barriers to care. We expect that ED and inpatient utilization will decrease and this cohort of high risk patients will have improved clinical outcomes and fewer downstream disease complications/issues.

Starting Point/Baseline

The baseline for this project at Baylor Medical Center at Garland does not exist. The program at Baylor University Medical Center has not been rigorously tracked. Approximately 90 patients have been seen over the past 2 years. On average, patients remain in the program for 298 days. Currently, the patient panel for the program includes Medicare patients who, under this project will be transitioned to a different service. Although this project is an extension of the current program Baylor Medical Center at Garland has in place, it has many new components

[210] RHP 9 Community Health Needs Assessment

[211] RHP 9 Community Health Needs Assessment.

[212] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011

(expanded care team, more services, greater frequency of visits, focus on Medicaid and Uninsured, etc).

Rationale

We selected this project because in the populations we serve, many times patients are unable or unwilling to come to the Baylor Clinic to receive the care they need. The Medicaid and uninsured populations have multiple social, economic and other barriers on top of clinical issues that prevent them from appropriately managing their health. This project uses a face to face mechanism whereby patients are monitored regularly and have all of their needs met in a venue that is convenient and comfortable for them. In a recent article in Health Affairs, entitled Six Features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients, Brown found supplementing telephone calls to patients with frequent in-person meetings; occasionally meeting in person with providers; acting as a communications hub for providers; delivering evidence-based education to patients; providing strong medication management; and providing timely and comprehensive transitional care after hospitalizations were characteristics of successful care coordination programs.[213] Our project, the Vulnerable Patient Network incorporates these components into the program and furthers them by adding additional services such examinations and clinical decision making to changing urinary catheters, labs, vaccinations. The team we propose to put in place would be able to address all of these needs in a coordinated and fluid fashion.

Project Components

We plan to engage in continuous quality improvement activities such as: identifying project impacts, "lessons learned," opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations.

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on identifying and intervening on high risk patients who are high utilizers of healthcare services and are unable or unwilling to receive care in an ambulatory care setting.

There is one point of clarification needed around the target population for this project. We define the target population as the following:

- Numerator: The number of patients enrolled in the program
- Denominator: The number of patients referred from the hospital as identified by Care Coordinators/Navigators as possible candidates based on identified risk factors including but not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting patients' ability to access care in ambulatory care setting

[213] Brown, RS. Six features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients. *Health Aff*. 2012 June; 21(6): 1156-1165.

The reason we selected outcome measures related to Quality of Life and Activities of Daily living was in order to emphasize the importance for the Care Team to identify and assess non-clinical barriers that may be impeding the patient from receiving the optimal level of care necessary to maintain and sustain their health status.

Unique community need identification number the project addresses: CN.3- Healthcare Capacity and CN.12 Emergency Department Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funds and is a new initiative. It is focused on addressing the complex needs of the highest risk patients by bringing care into their homes.

Related Category 3 Outcome Measures
The Category 3 Outcomes chosen for this project are based upon expected improvement for quality of life and activities of daily living. Many of the components included in Quality of Life and Activities of Daily living assessments help the care team to identify barriers to care and increase compliance. Both measures would also help to periodically and regularly assess QOL and ADL measures to keep an updated record of the patient's barriers to care.

Outcome Measure #1: IT-10.1 Quality of Life (**Standalone measure**).
Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[214] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure #2: IT-10.2 Activities of Daily Living (**Standalone measure**).
Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[215] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or barriers that patients may be experiencing.[216] We may need to consider using the Lawton IADL

[214] Hawthorne, G. The assessment of quality of life instrument: a psychometric measure of health related quality of life. *Qual Life Res.*8(3):209-24 (1999)
[215] Measuring ADLs Across National Surveys: http://aspe.hhs.gov/daltcp/reports/meacmpes.htm
[216] Katz, Sidney. 1983. "Assessing Self-Maintenance: Activities of Daily Living, Mobility, and Instrumental Activities of Daily Living." *Journal of the American Geriatrics Association* 31:721-727.

scale for this population as it involves more complex activities such as: shopping, laundry, responsibility for own medications, etc.[217] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Relationship to other Projects

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Patients that are in the Vulnerable Patient Network can come from the Baylor Clinic. Patients that are identified as high risk from the Baylor Clinic are candidates for the VPN program.

Category 4 Population-focused improvements

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations:

The thought here is that if patients receive the care they need they will have improved clinical outcomes and fewer ED or inpatient admissions.
RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.7, RD-1.8, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7, RD-4.1, RD-4.2

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Care Coordination models require an initial connection but also require resources to triage patients to. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the Region's responsibility to ensure there are outlets for these patients to receive the care they need.

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community. ***Baylor Medical Center at Garland*** defined the population that will be directly impacted by the project as the underserved/ uninsured patients are considered high risk both clinically and socioeconomically. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe when a person is connected to comprehensive care, available to them in their homes, compliance and outcomes both improve. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *3.* We believe when a person is positively impacted, their ED utilization decreases, community resource burdens are relieved and a greater number of people receive care. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.11.3 – Other Project Option- Evidence Based Interventions that put in place teams, technology and processes to ensure medication compliance and management- Medication Management and Prescription Assistance Program

RHP Project Identifier: 121790303.2.5 – Pass 2
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Provider: Baylor Medical Center at Garland is a fully accredited, 240-bed medical center serving the residents of Garland, Texas, and the neighboring communities. Baylor Garland has 582 physicians on its medical staff representing a wide range of specialties. Baylor Garland's service area represents a population of 640,000.

Intervention(s): This project will provide medication management and reconciliation services to uninsured and Medicaid patients at the Baylor Clinic on the Baylor Medical Center at Garland campus. Patients who are 150% or below the FPL and/or have chronic illnesses can qualify for prescription assistance. A clinical pharmacist will be responsible for oversight of prescriptions, educate patients about how and why to take their medications and review utilization, appropriateness and efficacy of medications that patients have been prescribed.
New v. existing initiative: This project is a new initiative and contributes to creating a complete PCMH for underserved patients.

Need for the project: Non-compliance to medications can lead to complications and clinical exacerbations that are often avoidable with proper management and education. Medications are an important part of a patient's care regimen but can become an impediment to care when issues such as access or cost become prevalent. This project will help to overcome these issues.

Target population: Baylor Clinic patients who have multiple medications, chronic diseases and/or have demonstrated need for prescription assistance. At least 90% of patients served will be Uninsured/Medicaid.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide medication management to 180 patients.

Category 3 outcomes: Category 3 outcomes for this project do not have any baseline data and improvements are based on ranges of current performance.

- **IT-1.2** Annual monitoring for patients on persistent medications - ACE inhibitors or ARBs (Non- standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.4** Annual monitoring for patients on persistent medications– diuretic (Non-standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.

- **IT-1.5** Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)**.** Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.19** Antidepressant Medication Management - (Standalone measure). Our goal is to increase effective acute phase treatment by 5% in DY3 to 15% in DY5 and to increase continuous phase treatment by 3% in DY3 to 7% in DY5.

Project Description

This project option combines project options 2.11.1- Implement interventions that put in place teams, technology and processes to avoid medication errors and 2.11.2- Evidence based interventions that put in place the teams, technology and processes to avoid medication errors. The project option we chose combines the components of both of these project options but focuses on medication management and compliance in the ambulatory setting within the patient's Baylor Clinic PCMH. Based on current estimates by our providers, we anticipate that more than 50% of patients in the Baylor Clinic have five or more medications. Ensuring that these medications are 1) appropriate, 2) taken correctly, 3) managed and 4) accessible will be important to improve clinical outcomes. By combining two of the project options 2.11.1 and 2.11.2 to create an "other" option encompasses both a process for avoiding medication errors and evidence based interventions to avoid medication errors. We intend to utilize a clinical pharmacist who will review patient mediations for those patients who have multiple prescriptions on a regular basis to ensure that medications are appropriate and to ensure the patient understands how and why they are taking the medications. Additionally, we plan to help patients obtain the medications they need through implementing a prescription assistance program to help patients who are eligible, qualify for mediations and provide medications to those patients who cannot afford prescriptions. We will attempt to provide medications at little to no cost for patients who are 150% below the federal poverty level, have one or more chronic diseases and remain compliant with their appointments and care regimens. Through this benefit and clinical pharmacist oversight and management, we expect adherence and compliance to medications will increase. The additional advantage to embedding this team within the PCMH is patients will receive comprehensive care management to address their needs in one care venue.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to provide prescriptions at little to no cost for patients that qualify or help patients enroll in programs to receive their medications, 2) provide clinical pharmacist oversight to ensure that medications are appropriate and adhered to, 3) patients understand their medications and reasons for taking them 4) improve clinical outcomes related to adhering to a medication regimen. The regional goals around managing chronic disease, ED utilization and behavioral health are all addressed through this project. Managing medications has ancillary effects on outcomes of multiple regional goals. If patients have access to and adhere to their prescriptions, chronic diseases and behavioral health issues would be under better control and there would be fewer exacerbations and visits to the ED. This program is also

a mechanism to improve cost savings for the region through monitoring utilization, finding generic prescriptions where appropriate and avoiding costly complications and expensive ED/inpatient utilization.

Challenges

Challenges with the underserved population and medication management pose one of the most difficult hurdles to overcome in their care. First, the uninsured and Medicaid populations are highly transient and may not maintain the same PCMH for an extended period of time. This causes gaps in their medication regimen and can often lead to clinical exacerbations. Another challenge is access to medications and affordability. Patients who do not live near a pharmacy to fill their prescriptions or cannot afford to fill them will forgo this part of their care or ration the medications they have, leading to complications and escalations in their conditions. One trend we have seen in RHP 9 is indigent patients will go from ED to ED across the region to receive pain medications and because there is little coordination between hospital systems, there is no consistent record of the medications these patients receive. Lastly, patients that are polypharmacy often do not understand how to take their mediations appropriately or understand why they need the prescription at all. This lack of understanding also leads to non-compliance. With this project, we plan to address these challenges by providing medications at little to no cost for those patients that qualify, help patients that are eligible get on prescription assistance programs, provide prescriptions in the Baylor Clinic or nearby on the Baylor campus and offer clinical pharmacist oversight to monitor the patients' prescriptions and encourage compliance to a medication regimen.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 180 patients with medication management in a PCMH setting, 2) increased frequency of medication reconciliation and management, 3) greater literacy around medication regimens and purposes, 4) efficient and effective utilization of medications for patients and 5) make the clinical pharmacist part of the PCMH care team. We through proactive management of mediations for the uninsured and Medicaid populations that clinical outcomes will improve, there will be fewer exacerbations of patient diseases.

Starting Point/Baseline

Baylor clinics have not historically provided any type of formal medication management or prescription assistance type program to patients. This is a new program that will be offered. Based on historical data, almost 50% of patients have five or more prescriptions. We anticipate that on average about 5-10% of high risk Baylor Clinic patients will need focused and frequent medication management services. We will have to establish the baseline in DY2 for the particular medications mentioned in the Category 3 outcomes and to determine the scope of high risk and polypharmacy patients.

Rationale

We selected this project for multiple reasons: 1) to offer a complete suite of services to patients in a Baylor Clinic PCMH ranging from chronic disease and behavioral management, basic primary care, specialty care and medications, 2) provide regular medication management and reconciliation to ensure appropriate utilization and adherence to prescriptions, 3) improve clinical outcomes by enforcing a medication regimen with patients and 4) improve adherence to medications by offering assistance in obtaining them. Successful programs that focus on coordinating care for patients include a medication management component.[218] Our overall goal is to create a PCMH for uninsured and Medicaid patients that is comprehensive and has co-located services to allow for greater convenience and compliance for patients. The total economic impact of medication non-adherence — which contributes to costly health complications, worsening of disease progression, and preventable utilization — has been estimated to be as much as $290 billion.[219] For patients with diabetes, those with low levels of adherence have almost twice the total annual healthcare costs of those with high levels of adherence ($16,498 versus $8,886).[220] The New England Healthcare Institute cited four components to improving medication management: 1) creating health care teams, 2) patient engagement and education, 3) payment reform and 4) leveraging health information technology.[221] This project addresses all of these components by 1) integrating the clinical pharmacist into the PCMH team, 2) educating the patient on why and how to take their medications, 3) offering prescription assistance and little to no cost medications for those who qualify and 4) using the Baylor Clinic electronic health record to monitor prescription regimens, fulfillments and utilization. There have been studies published stating that giving patients medications for free does not promote utilization and adherence.[222] In a study published in the New England Journal of Medicine, insured patients who were discharged from the hospital and had their prescriptions fully covered still only had adherence rates of 40-50%.[223] We will control for this in two ways: 1) we will not offer prescriptions for free unless the patient is 150% or below the FPL and/or has at least 1 chronic disease and 2) we will require that a patient is seen regularly in the Baylor Clinic to continue to receive their medications.

Project Components

We have chosen applicable components from project options 2.11.1 and 2.11.2 to create our project around medication management.

a. Develop criteria and identify targeted patient populations that are at high risk for developing complications, co-morbidities and/or utilizing emergency care services: *We will use our electronic health record to identify polypharmacy patients, patients who are on chronic disease medications and/or are high utilizers of the ED*

[218] Brown, RS. Six features of Medicare coordinated demonstration programs that cut hospital readmissions of high risk patients. *Health Aff*. 2012 June; 31(6):1156-1165.

[223] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

b. Develop tools to provide education and support to those patients at highest risk of an adverse drug event or medication error. *The clinical pharmacist we use for this program will help to educate the patient on these topics. We will ensure that materials are multilingual as well.*

c. Conduct root cause analysis of potential medication errors or adverse drug events and develop/implement processes to address those causes: *As one of our metrics, we will be designing the workflow for the clinical pharmacist and we will add this component into the plan*

d. Implement pharmacist led chronic disease medication management services in collaboration with primary care and other healthcare providers: *The clinical pharmacist will be co-located in the Baylor Clinic and will interface with the PCMH team on a regular basis*

e. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on increasing the number of patients who receive medication management services and by having outcomes that specifically focus on medications, this will encourage the care team to manage and monitor medications more frequently and with higher scrutiny. Although medication management is part of the patient's overall care in a Baylor Clinic, these milestones, metrics and outcomes will put a greater emphasis on ensuring that mediations are appropriate, regularly reconciled, adhered to and are utilized in order to improve clinical outcomes for patients. The outcome measure medications that we chose: ACE/ARB inhibitors, diuretics, anticonvulsants and antidepressants are drugs that are regularly used by our Baylor Clinic patients. Since many of our patients have hypertension and CHF, adherence improvement to these drugs will help to facilitate better outcomes.

Unique community need identification number the project addresses:

CN.11 Patient Safety and Quality and CN.4 Primary Care and Pediatrics

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any federal funds and is a new initiative. It is focused on providing prescriptions for patients in need and ensuring that utilization of these prescriptions is appropriate and (cost and clinically) effective.

Related Category 3 Outcome Measures

The Category 3 outcomes for this project focus on medication management and monitoring for specific drugs that many of our Baylor Clinic use. These medications are also associated with complex chronic diseases and behavioral health issues. These drugs are an important part of a patient's care regimen to keep their conditions well controlled.

Outcome Measure #1: IT-1.2 Annual monitoring for patients on persistent medications angiotensin
converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (Non- standalone measure).
Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to antihypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[224] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure #2: IT-1.4 Annual monitoring for patients on persistent medications–diuretic (Non- standalone measure)
Approximately 33% of Baylor Clinic patients on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[225]

Outcome Measure #3: IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)
Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-

[224] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

adherent.[226] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure #4: IT-1.19 Antidepressant Medication Management - (Standalone measure) Approximately 20% of Baylor Clinic patients on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the region. The top 10 utilizers in the region had BH related issues.[227] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[228]" Our project supports this methodology.

Relationship to other Projects

121790303.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This medication management and prescription assistance program will be available to patients who are Baylor Clinic patients. The program will be incorporated into the overall care team and management of the patient.

Category 4 Population-focused improvements

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations: The thought here is that if patients take the appropriate medications in the right dose and correct regimen, the following improvements can be expected:
RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.8, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7, RD-3, RD-4.1, RD-4.2

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

TBD

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may

enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Garland defined the population that will be directly impacted by the project as the underserved/uninsured patients that need prescription assistance and medication management services that are patients at a Baylor Clinic PCMH on the ***Baylor Medical Center at Garland*** campus. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is on the correct prescription and on an appropriate medication regimen, they are better able to manage their illnesses and have better clinical outcomes. To determine the value to the community of each, we concluded that, on a scale of 1 – 5, the value of this project is a *3.* We believe this to be the correct number because, when a person is positively impacted, unnecessary drug utilization decreases, patients are able to become well and resume being active and productive members in society.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.2.2 – Expand Chronic Care Management Model - Create Chronic Disease management and Prevention Program

RHP Project Identifier: 121776204.2.1
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): The project purpose is to provide focused education and point of care testing for underserved patients who have diabetes, CVD and/or Respiratory disease that are in need of education, clinical management and training within a primary care setting. We will co-locate primary care and chronic disease management services to improve clinical outcomes. This project is new because it will provide CHF and Asthma education and point of care testing, all which have not been done before. We have had some Diabetes education in our Clinics but not a formal and focused program for the Medicaid/Uninsured population.

Need for the project: One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease. Components of patient education and helping patients to understand their illness, how to better manage it, how to coordinate their lifestyle choices and offering point of care testing in order to achieve optimal health outcomes are essential in population management of chronic disease

Target population: Approximately 275,000 individuals in Dallas County have Diabetes. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. The underserved segment of this population is who we will target. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide chronic disease education and point of care testing for 688 patients in the Irving area.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period.

- IT-1.10: Diabetes Care: HbA1c Poor Control. Our goal is to decrease the number of patients with uncontrolled HbA1cs (> 9.0%) from 10.3% currently to 8.8% (or 1.5% improvement-reduction over baseline) in DY5.

- IT-11.1: Diabetes Care: BP Control (< 140/80 mmHg). Our goal is to increase the number of diabetic patients in good BP control (< 140/80 mmHg) from 58.9% to 64.8% (or 5.9% improvement over baseline) in DY5.

- IT-1.13: Diabetes Care: Foot Exam. Our goal is to increase the number of diabetic patients who receive foot exams from 73.4% currently to 80.6% (or 7.2% improvement over baseline) in DY5.

Project Description

The Baylor Clinic on the Baylor Medical Center at Irving campus, would house a carved out chronic disease management program to provide focused and dedicated education and care for patients (including Medicaid/Uninsured) with Diabetes, Cardiovascular Diseases (CVD) (i.e.: Congestive Heart Failure) and Respiratory Diseases (Asthma/Chronic Obstructive Pulmonary Disease) within a primary care setting. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients. Specific staff, comprised of CHWs and Nurse Care Managers, would address the complex clinical and prevention needs of these patients and spend time specifically on management of these diseases. The focus of this time and education with patients would not only entail clinical counseling, but also include prevention components to focus on lifestyle issues and self-management. The other key advantage that patients will receive as part of this program is point of care testing for Diabetes (HbA1c testing and glucose testing using test strips) and Asthma (Peak Flow Meter Assessments). We believe this will overcome the barrier of patients' non-compliance with completing lab orders and any financial or transportation issues that would arise in obtaining these important lab results.

We plan to leverage the expertise and experience of both the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) and Baylor Clinics to provide staff education, develop competencies, and create protocols that will result in a complete and robust program tailored for multiple community settings. The Diabetes Health and Wellness Institute would house this staff and appropriately triage and manage providers to see patient at Baylor Clinics based on volume and demand parameters. Baylor Clinics have had previous success in managing patients with chronic disease through the creation and development of a community health worker model (CHW). These successes and competencies will be leveraged to create programs around CVD and Respiratory illnesses.

The project goals for this program include: 1) increasing health literacy around chronic illnesses for patients in the community, 2) educate and teach self-management techniques for patients to manage their chronic diseases, 3) augmenting RN care managers with CHWs to serve a greater number of patient through a carved out, focused care model, 4) increasing the number of patients who are screened and monitored for their chronic diseases using point of care testing and 5) increase education for patients with CHF and Asthma/COPD (2 disease states previously not offered). The purpose for a project in this area is to help identify patients with

chronic diseases and provide them with treatment and education in a proactive fashion so that downstream complications can be avoided and ED/inpatient utilization can decrease.

One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease[229]. Components of patient education and helping patients to understand their illness, how to better manage it and how to coordinate their lifestyle choices to achieve optimal health outcomes are essential in population management of chronic disease. This project coincides with this need and focuses on education, lifestyle management, proactive counseling and decision making and clinical improvement. This leads to lower ED visits for acute issues related to chronic diseases and helps patients utilize costly services in the Region.

Challenges

Underserved patients experience multiple barriers to effectively manage their chronic illnesses. These include lack of knowledge, lack of social support, poor diets, insufficient physical activity, and limited access to care due to financial and transportation issues. By co-locating the chronic care management program within the primary care clinic, patients can receive medical care and chronic disease support at the same time. Additionally, the PCP's medical management is informed by the chronic care management team's interactions with the patient, which, in our experience, elicits new information regarding lifestyle and barriers to health. The RN/CHW model will be structured so that patient education is delivered in a format and context that is understandable and enjoyable for the patient. Lastly, the education and counseling will include lifestyle and self-management techniques so that this population can find ways to care for themselves that is relevant to their daily lives.

5-year Expected Outcome for Provider and Patients

The expected 5-year outcomes are that: 1) at least 688 patients will have served by the Chronic Care Management model at the Baylor Clinic, 2) we expect better clinical outcomes around HbA1c, foot exam completion and BP control, 3) more patients in the community will have had a point of care test completed for their diabetes or asthma which will provide real time results and opportunities for improvement for the patient and provide, 4) increase literacy in the Irving community around chronic diseases and 5) decrease rates of avoidable/unnecessary complications (i.e. amputations) due to chronic diseases.

Starting Point/Baseline

Currently, the Baylor Clinic on the Baylor Medical Center at Irving offers a limited program focused on diabetes education. Of the patients enrolled in the program, approximately 10% of clinic patients have an HbA1c > 9.0. This baseline is not directly comparable to the proposed project for chronic care management because we will be including CHF and Asthma/COPD patients as well as part of the initiative.

We estimated a target population based on the Community Health Needs Assessment, 11.4% of all Dallas County residents have diabetes, this equates to almost 275,000 individuals in the

[229] RHP 9 Community Health Needs Assessment

county. Literature shows that diabetes is more prevalent in the underserved community[230]. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. These statistics do not take into consideration any intersection of CHF, Asthma and Diabetes which makes individuals more complex and high risk. [231] Our project will serve approximately 688 new patients of this population.

Rationale

We selected this project option because of the prevalence of chronic disease in the underserved population. Through co-locating primary care, behavioral health and chronic disease management services, we can improve clinical outcomes. By increasing the availability of chronic care services and utilizing a team based approach, more patients can receive focused attention for their complex needs and learn to self-manage their illnesses in an effective way. We have demonstrated statistically significant reductions in mean HbA1c measures with a CHW model currently embedded in Baylor Clinics[232]. Thus expanding the educational services to serve more diabetes patients, and beginning to serve CHF and Asthma/COPD patients is a logical next step in improving the care of the population. The Community Health Needs Assessment identified the top 5 most prevalent conditions as: stroke, diabetes, CHF, failing kidneys and AMI. This project addresses 2 of these illnesses directly and 2 indirectly, it aligns exactly with the needs of the Region and the challenges that have been identified.[233]

Project Components

We will engage in continuous quality improvement activities throughout the duration of the project such as: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to continuously integrate the chronic disease management program into the care team as much as possible.

Reasons for selecting outcome measures

The Chronic Care Management metrics and milestones we have chosen focus on finding the appropriate model that would be effective in Dallas County that also addresses multiple chronic illnesses. Based on the complexities of the underserved population, we structured our metrics to focus on increasing access, awareness and education for individuals in the region and in the latter years including metrics around increased compliance to recommended clinical protocols. We believe it will take time for patients to understand and epitomize good self-management behaviors and it will also take times to see marked clinical outcome improvements. We do anticipate some clinical improvement for those patients that have been engaged in the chronic care management program for an extended period of time. We have not historically completed

[230] RHP 9 Community Health Needs Assessment

[233] RHP 9 Community Health Needs Assessment

programs for CHF and Asthma/COPD and will use this opportunity to create a continuous improvement environment where these programs can be refined and modified as we gather more experience.

Unique community need identification number the project addresses: CN.8 Chronic Disease

How the project significantly enhances an existing delivery system reform initiative

We currently do not receive any federal funding for chronic disease education and providing services for CHF and Asthma/COPD are new to the Baylor Clinic. This project coincides with the need to focus on chronic illnesses, as they are the main drivers of health care costs in the US. Diabetes alone costs the US almost $174 billion dollars a year. [234]

Related Category 3 Outcome Measures

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Outcome Measure #1: IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (**Standalone measure**). In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes with more than 32% of the population classified as obese and at risk for developing Diabetes[235]. Traditionally, the underserved population does not have access to the necessary medications, education and supplies to manage their diabetes, thus many times patients go undiagnosed or have poor glucose control. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels Bodenheimer, et al., found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients[236]. A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[237]. Focusing efforts on increasing improvement of good glycemic control will result diminishing in other co-morbid conditions and improve complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

Outcome Measure #2: T-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (**Standalone measure**). At Baylor Health Care System, blood pressure control and management

[234] http://www.diabetes.org/diabetes-basics/diabetes-statistics/

[235] RHP 9 Community Health Needs Assessment

[236] Bodenheimer, T., Lorig, K.., Holman, H., Grumbach, K. Patient Self-management of Chronic Disease in Primary Care *JAMA* (May 15, 2008).

[237] MenzinJ, Korn, J, Cohen, J, et.al Relationship between glycemic control and diabetes related hospital costs in patients with type 1 or type 1 diabetes mellitus. J Manag Care Pharm. 2010; 16(4):264-275.

is a required part of the diabetes care in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[238]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic. Again, similar to HbA1c, we expect modest improvement in BP in years DY4 andDY5 contingent upon patient participation in the clinic and chronic disease program. Our primary goal will be to have patients come in for basic services and chronic disease education.

Outcome Measure #3: IT-1.13 Diabetes care Foot exam- NQF 0056 (**Non- standalone measure**).An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations,

Relationship to other Projects

121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This chronic care management project is related because: 1) services will be co-located and 2) the chronic care team will be integrated with the primary care team to facilitate complete care and efficiency for the patient.
121776204.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment
The project involving developing care management functions to integrate primary and behavioral health needs of individuals is related to this project of chronic care management because often times patients have co-occurring chronic disease and mental health issues which require attention. These programs can cross-refer depending on the patient's needs.

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as underserved patients who have Diabetes, Asthma, and/or CHF that are in need of education and treatment. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe, patients will increase their ability to self-manage her illness(es) and maintain their health rather than relying on the physician or ED to manage her conditions. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe, when a person is positively impacted, his propensity to understand his illness, share his knowledge with others and help spread health literacy increases. Patients learn to manage their illnesses and escalations themselves rather than relying on expensive resources such as the ED.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects

within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.19.1 – Develop Care Management Function that integrates primary and behavioral health needs of individuals

RHP Project Identifier: 121776204.2.2
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will co-locate and integrate outpatient behavioral health services using an LCSW to provide counseling services. Screenings for depression, substance abuse and anxiety will also be an integral part of the program. This is a new project that has not been done before. It will serve the BH needs of the Uninsured/Medicaid population.

Need for the project: The RHP 9 Community Needs Health Assessment identified behavioral and mental health issues are a large unmet need in most counties within the region and also identified as the most difficult to access services in the Region. Behavioral Health issues are an identified impediment to clinical adherence and when addressed can create a material impact on clinical outcomes. Behavioral Health issues are especially prevalent in the underserved populations.

Target population: Underserved (Medicaid and uninsured) population in the Irving area with behavioral health issues.
Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide screening and interventions to 688 patients in the Irving area. Approximately 85-90% of these patients will be Medicaid/Uninsured.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends /literature based metrics that had material impact on patients in a 2-3 year time period.

- IT-11.1: Improvement in Clinical Indicator in Identified Disparity Group: Improvement in Diabetes Metrics (HbA1c, LDL, BP) for disparate group of uninsured/Medicaid patients with an underlying BH issue. Our goal is to have 5% of patients in DY3 achieve improvement in Diabetes Metrics (HbA1c, LDL BP), 10% in DY4 and 15% in DY5.

- IT-11.3: Improve utilization rates of clinical preventive services in target population with identified disparity: Improve utilization of BH services for patients who have been screened/identifed and diagnosed with an underlying BH issue. Disparate population is

underserved population with BH issue. Our goal is to increase the patients who engage in BH treatment rates from 10% in DY3 to 20% in DY5.

Project Description

This project will co-locate and integrate behavioral health services into the outpatient primary care setting. The model that we aim to develop would consist of providing a LCSW to provide basic counseling services to address behavioral health needs such as: anxiety, depression, and substance abuse issues. The screening tools we plan to use are evidence based and will most likely include: PHQ2 or 9, GAD-7 and alcohol and substance abuse screeners. Additionally, the LCSW would have the support of a Community Health Worker (CHW) to help with the screening and referral processes. The training for the CHWs , LCSWs and model development would occur at the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) where the competencies and expertise would be created. From there, this staff can be triaged to clinics and community locations to provide behavioral health services. The behavioral health program would require that the LCSW and CHW to work together with the primary care team to: 1) identify the patients who have behavioral health issues, 2) coordinate the patient's care and appointments to fit both the behavioral health and primary care appointment in the same visit and 3) help the primary care team to identify those patients whose behavioral health issues are impeding the management of their acute/chronic disease management models. We anticipate approximately 85-90% of patients in this program will be Uninsured/Medicaid.

Goals and Relationship to Regional Goals

The goals of this project are to increase the baseline of behavioral health services provided and screenings conducted to the underserved population in the Irving area received in an outpatient setting. By co-locating the behavioral health service with a patient's PCMH, we anticipate that compliance and adherence to attending behavioral health appointments will increase. Through increased screening, awareness and intervention, we also anticipate that behavioral health issues such as anxiety, depression and substance abuse will be proactively identified and addressed in order to allow the clinician and patient to focus on more acute/chronic illnesses that require protocol adherence. The derivative goal of this would also be to decrease ED visits related to behavioral health issues that are manageable in the outpatient setting. We believe by treating the underlying barriers associated with behavioral health, this will result in better health outcomes for this population. The RHP 9 Community Needs Health Assessment identified behavioral and mental health issues are a large unmet need in most counties within the region and also identified as the most difficult to access services in the Region. There were three regional priorities around behavioral health including integrating behavioral health with primary care and addressing behavioral health in other settings. More than 10% o f Dallas County residents "binge drink" and there are more than 10 deaths per 100,000 related to suicide[239]. Only 19% of patients receive behavioral health and primary care services in the same setting[240]. The most compelling statistic is that 100% of the

[239] Healthy People North Texas: http://www.healthyntexas.org

[240] RHP 9 Community Health Needs Assessment

10 most frequently admitted patients had a co-occurring behavioral health diagnosis. The aforementioned statistics make a strong and significant case that basic behavioral health services can achieve "quick wins" for this underserved population. This project is directly aligned with the Regional needs and is positioned to help facilitate care related to substance abuse, anxiety and depression[241].

Challenges

The challenges with behavioral health initiatives are that identification of patients and willingness of those patients to participate in a formal program do not coincide. There is a stigma associated with receiving counseling or behavioral health services which makes it difficult for providers to identify patients that have these underlying behavioral health issues and even more difficult for providers to get patients to come in for these types of appointments. In the community, patients do not see their behavioral health issues as a medical condition, thus the problems are often ignored and results in these patients using the ED for their acute behavioral health escalations. While this program would not focus on serious psychiatric issues such as schizophrenia or bipolar disorders, identifying depression or anxiety can have a significant impact on the patient's propensity to comply with medication and clinical recommendations/protocols. The way we plan to address the challenges mentioned above is through providing these services in a non-threatening way by individuals (CHWs/LCSWs) that come from the community they are serving. By using CHWs or LCSWs over physicians or other higher level providers, this should put the patient at ease. The program will also be presented in a counseling type environment rather than a psychiatric evaluation environment. Lastly, we will make behavioral health screenings a routine part of most primary care visits so that the assessments coincide with the patient's typical care.

5-year Expected Outcome for Provider and Patients

The 5 year expected outcome is that at least 20% of the total unduplicated patients (approximately 688 patients) will receive behavioral health services at the Baylor Clinic at Irving. By identifying underlying behavioral health issues, acute and chronic medical issues can be addressed and compliance/adherence to clinical protocols should increase as well.

Starting Point/Baseline

There is no baseline for this project because there are no initiatives for behavioral health that are offered or ever have been at the Baylor Clinic located on the Baylor Medical Center at Irving. This is a brand new program that will be administered to Clinic patients. We do know that the target population in the Dallas county area is over 200,000 underserved individuals who suffer from a mental illness. We calculated this number taking the uninsured population in Dallas County (872,000)[242] and a 2011 statistic taken from the Centers for Disease Control and Prevention that found 23% of uninsured patients suffer from a mental illness.[243]

[241] Healthy People North Texas: http://www.healthyntexas.org

[242] http://quickfacts.census.gov/qfd/states/48/48439.html

[243] CDC: http://www.cdc.gov

Rationale

The reasons for selecting this project option are because behavioral health was not only identified as a major regional need, but Baylor Clinics have the infrastructure to effectively manage these types of issues within its PCMH framework. Many of our patients have underlying behavioral health issues which the physicians simply do not have time to address during a typical primary care visit, this model would allow patients to receive personalized attention for their behavioral health specific issues and allow the physicians to spend time on managing clinical issues. We believe by implementing a behavioral health component as part of the PCMH we have established, that patients will have improved overall health outcomes and providers will have greater satisfaction because these services will be performed by individuals who have an expertise in managing behavioral health issues. Lastly, we believe adding a behavioral health component to our primary care team will allow for cross communication between providers to understand all of the complex needs that are prevalent in this particular population.

Project Components

This behavioral health project has many components, all of which are addressed below:

a) Conduct data matching to identify individuals with co-occurring disorders who are:
   - not receiving routine primary care-*Patients who enter in to the behavioral health program will be automatically part of a PCMH*
   - not receiving specialty care according to professionally accepted practice guidelines: *We will be tracking this metric as part of our specialty care project- 1.9.*
   - over-utilizing ER services based on analysis of comparative data on other populations: *This is a metric that we already track and will continue to do so*
   - over-utilizing crisis response services. *This particular factor may be difficult to gather data on and is not typically a data point we collect*
   - Becoming involved with the criminal justice system due to uncontrolled/unmanaged symptoms. *This factor may be difficult to gather data on - not typically collected*

b) Review chronic care management best practices such as Wagner's Chronic Care Model and select practices compatible with organizational readiness for adoption and implementation. *We plan to review the most effective models that address both chronic care and behavioral health to determine which model would easily address the intersection of both programs*

c) Identification of BH case managers and disease care managers to receive assignment of these individuals: *We plan on hiring LCSWs and CHWs to act as BH care managers*

d) Develop protocols for coordinating care; identify community resources and services available for supporting people with co-occurring disorders: As part of identifying which patients would be eligible and appropriate for this BH program, we will be developing

clinical protocols to identify patients and coordinate their care within the Baylor Clinic PCMH

e) Identify and implement specific disease management guidelines for high prevalence disorders, e.g. cardiovascular disease, diabetes, depression, asthma. *We plan to address this criteria through Chronic Care Management project (2.2.1- Expand Chronic Care Management Models)*

f) Train staff in protocols and guidelines. *All staff will be made aware of this program and be trained on scheduling and identifying patients who could be part of this BH program*

g) Develop registries to track client outcomes. We currently have a robust E.H.R in which we track other patient clinical metrics and measures, it would be redundant and inefficient to create a separate registry to track outcomes of this specific project. We intend to track outcomes in the current E.H.R.

h) Review the intervention(s) impact on quality of care and integration of care and identify "lessons learned," opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. *As part of our monthly review of project status, this will be included as will review of other DSRIP projects the Baylor Clinic will be engaged in. We will focus on key challenges associated with expansion and determine how and if BH needs to be scaled to meet patient needs.*

Reasons for selecting outcome measures

The milestones and metrics chosen are focused on increasing volumes of patients seen. In order to be effective, patients will need to attend their appointments and be compliant with the recommended guidelines for their behavioral health issues and subsequent medical issues. In order to achieve the proposed metrics and milestones all of the other DSRIP projects will have to coordinate and synchronize in order to fulfill the metrics chosen. This will be advantageous to the Region, as it will create synergy and a complete plan of care for the patients in the target population. In the Planning Protocol, there were no options for Improvement Milestones that were directly applicable to this Behavioral Health program. Many of the metrics were focused on chronic disease, which we have an entire separate DSRIP project dedicated to. Thus, we created two customizable improvement milestones that focus on 1) increasing patient volumes (capturing eligible patients) and 2) improving rates of screening for anxiety, depression and substance abuse.

Specify the unique community need identification number the project addresses:

CN.5- Behavioral Health, CN.6-Behavioral Health and Primary Care

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any federal funding and is a brand new initiative. There is currently no outpatient based behavioral health program offered to the underserved population at the Baylor Clinic at the Baylor Medical Center at Irving. This project will provide a

low cost, effective intervention to those patients with behavioral health needs in a setting that is manageable for providers to identify potential escalation points related to behavioral health issues.

Related Category 3 Outcome Measures

Category 3 metrics for this project were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. We will establish project baselines during DY2.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (**Standalone measure**). We plan to measure the impact of diabetes management and control for patients who have enrolled in the proposed behavioral health program. A recent study conducted in early 2012, by Jeffery Johnson, et. al showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression.[244] Depression is associated with poorer self care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.

Our Baylor Clinics currently track the Diabetes Percent of Opportunities Achieved (POA) for all patients with Diabetes. This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their diabetic patients than in the prior reporting period.

For an illustrative example: For Diabetes- there are 3 opportunities (i.e. metrics) per patient (1) LDL < 100 (2) A1c < 8 and (3) BP < 130/80 mmHg. The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 76% achievement.

[244] Johnson, JA, Sayah, FA, et.al. Controlled trial of a collaborative primary care team model for patients with diabetes and depression: rationale and design for a comprehensive evaluation. BMC Health Services Research. 2012, 12:358

However, adding behavioral health as a subset of measurement for this patient population may change the actual improvement that is attainable. Because this is a new program, we do not have any historical data on the actual Diabetes improvement for those patients who receive a behavioral health intervention. We only have literature which has shown improvement in Diabetes with interventions related to depression. Thus, the improvement targets we have listed for Category 3 may differ as we implement the program.

Outcome Measure #2: IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (**Non-standalone measure**). We plan to focus on the treatment component of this metric, defining treatment as those patients who engage in the behavioral health program. We anticipate that patients who enter our Baylor Clinic and are identified as individuals who would benefit from a behavioral health intervention will have improved treatment and utilization rates.
Numerator: patients who are a Baylor Clinic patient and engage in behavioral health program
Denominator: patients who are a Baylor Clinic patient, eligible for behavioral health services
The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure differs from our customized Improvement Milestone I-X: Target Population Reached: Increase Number of patients enrolled in BH program because the Improvement Milestone is focused on increasing volumes of eligible patients. Outcome measure 11.3 takes this one step further to ensure that the patient actually engages in the behavioral health program. By qualifying "engage" as a minimum of two interventions/encounters in the last 12 months, this varies from the Improvement Milestone of just increasing volume.

Relationship to other Projects

121776204.2.2- Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program. The Chronic Care Management Model project is related because if patients have a co-occurring behavioral health issue and chronic diseases, the services are co-located and patients can be referred into both programs if necessary

121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This behavioral health project is related to the expansion of primary care capacity project because 1) the services will be co-located and 2) the behavioral health team will be part of the overall primary care team; providing complete and efficient care for the patient.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Behavioral Health is pressing issue across the Region and will require collaboration and coordination between providers to manage these types of issues in a less costly, personalized setting. Our project differs from the two above because our focus is on counseling and screening. We will focus on disorders such as depression, anxiety and substance abuse. The plan is to continue learning collaborative initiatives through the Dallas-Fort Worth Hospital Council for the performing providers of RHP 9.

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as the underserved PCMH Baylor Clinic patients with an underlying behavioral health issue(s). We used the pricing matrix developed by Regional providers to determine the value for each positive outcome. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this because, when a person is impacted, their compliance and adherence to clinical protocols increases, their satisfaction increases and self-management of their illnesses increases. To determine the value to the community, we concluded that, on a 1-5 scale, the value of this project is ***4.*** We believe when a person is positively impacted, their productivity in the community increases as mentioned in the Community Health Needs Assessment where 25% of the population reported lost work days due to a mental health issue. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an

econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program - Care Connect

RHP Project Identifier: 121776204.2.3
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will identify and connect underserved patients in the hospital to a PCP/PCMH, create a multi-disciplinary care plan for frequently admitted patients and provide comprehensive follow up calls to patients to ensure they have an appointment and transportation to get to it. This project will be new to Baylor Irving, utilizing the technique and infrastructure from Baylor University Medical Center and Baylor Medical Center at Garland.

Need for the project: Connecting patients to a PCP/PCMH will reduce ED utilization and provide outpatient services for complex patients. Overutilization of the ED was identified as a Regional issue.

Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH who come to the ED. Approximately 85% of new patients enrolled in this program will be Medicaid/Uninsured.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 3360 new patients from the community.

Category 3 outcomes: Category 3 outcomes for this project are from 2 different domains the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

- IT-5.1: Improved Cost Savings. Our goal is to increase cost savings of healthcare utilization (total cost of care in one year) of patients who have been connected to a PCP/PCMH appointment from 15% in DY3 to 25% in DY5. .
- IT-6.1: ED Appropriate Utilization.Our goal is to decrease all ED visits (including ACSC) from 25% in DY3 to 35% in DY5 and targeted conditions ED utilization (CHF, Diabetes, ESRD, CVD/Hypertension, BH/SA, COPD, Asthma) from 10% in DY3 to 20% in DY5. We will be excluding pediatric emergency visits as part of this metric measurement because Baylor Medical Center at Irving ED does not see a large volume of pediatric patients.

Project Description

This project aims to create a fluid care navigation program located at Baylor Medical Center at Irving Emergency Department for patients (including Medicaid/Uninsured) who are identified (or proclaim) to not have a primary care physician and/or patient centered medical home to address their post-acute care needs. Approximately 85% of new patients enrolled in this program will be Medicaid/Uninsured. By having staff physically located in these locations, patients can receive real time assistance in finding a provider and ensuring they are connected with the appropriate resources they would require once discharged home. We will include staff coverage on the weekends as well to ensure that patients are able to be seen and connected to resources 7 days/week. Additionally, in order to close the loop, staff will follow-up with patients to make sure they have an appointment and that they attend their appointment. The staff will also be responsible for ensuring that other barriers such as transportation are addressed and patients are able to attend their follow-up visits. The Care Connect staff will receive e-mail notifications any time a patient revisits the hospital, at this time staff will proactively visit with the patient to ensure the patient is able to access their PCP/PCMH appointment and/or recommended community resource(s). Care plans will be developed for patients with high hospital utilization (especially patients with frequent emergency department visits) and complex needs. Care plans will include involvement with Social Work Supervisor, Hospital Medical Director and other hospital staff. Patients with care plans will be contacted as often as needed to ensure continuity of the care plan.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to connect a greater number of patients to a PCP/PCMH in the Irving community, 2) ensure the patients have the resources they need to care for themselves post discharge, 3) keep patients out of the ED and 4) create a care plan for high risk patients which ensures that the patient is receiving the follow-up care they need and are identified by staff when they readmit to the hospital

One of the major goals for the region is to reduce ED utilization and readmissions. This project focuses on and emphasizes both of these components. The entire impetus of the project is focused on Care Coordination and ensuring that patients are triaged to appropriate community and outpatient based resources. This is a strategy to decrease overall spending on health care in the region and help more patients connect to the essential primary care needed to maintain their health.

Challenges

Challenges with the underserved population almost always route back to the lack of continuity of care across the continuum. Because of their financial, time and resource constraints, this population often find a temporary fix to their health issue and once discharged from the hospital do not receive the care they need to stay healthy. If a patient is given an appointment

post discharge, they may have issues with transportation and other barriers that impede their access to care. Typically there is no follow-up to ensure the patient knows when their appointment is and if they actually went. This program aims to address these issues by identifying patients who do not have a PCP/PCMH, finding one for them, ensuring they have the resources they need to keep their appointment and then following up with the patient.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 3360 patients connected to a PCP, PCMH or community resource, 2) 35% of these patients will have confirmed appointments within 14 days post-discharge. We expect that there will be fewer ED visits and readmissions for this population that was connected through this program and will experience overall improved health outcomes due to receiving appropriate and adequate post-acute care.

Starting Point/Baseline

The baseline for this project at Baylor Medical Center at Irving is 0. This program will be brand new to the hospital. Based on recent performance at Baylor Medical Center at Garland for the same program, about 849 patients were served by the program from November 2011 to July 2012. We will have to establish the baseline of this project and determine the potential number of patients that would benefit from this program at Baylor Irving in DY2 and DY3. We anticipate that the targeted population for the entire region is approximately 260,000 patients. This is calculated by taking the average rate of patients who are uninsured that do not have a PCMH/PCP (30%) multiplied by the total number of uninsured in Dallas (36% of the population).[245]

Rationale

We selected this project because it is a low cost, highly effective way to help promote the continuity of care for the underserved population. Utilizing CHWs and social work as the main staff involved in this project, these individuals are connected to the community and understand their complex needs. This project helps patients that do not have a PCP/PCMH connect to one and then also offers the continuous improvement piece that is often missing in these types of initiatives. We selected this project for Baylor Medical Center at Irving because we have seen demonstrated results in the time the project has been implemented at Baylor Medical Center at Garland and expect similar results at Baylor Medical Center at Irving. The program has reduced readmissions and lowered ED utilization. The other attractive component this project are the multidisciplinary care plans that will be developed for the highest risk patients to identify these individuals and hone in on triggers that cause them to (re)admit. We believe that this intervention is an effective way for staff to be involved with the patient at a grassroots level and allow patients to feel that they have someone responsible for their ongoing care and navigation needs.

[245] Census Quick Facts: http://quickfacts.census.gov/qfd/states/48/48439.html

Project Components
This project has multiple components from the protocol, all of which are listed below:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency: *This is a core part of our program we will be focusing on all ED patients that are identified to not have a PCP/PCMH. Our Care Plans are developed for patients who are frequent ED utilizers as well. Lastly, our CHWs that we will be hiring come directly from the communities they serve so they understand the challenges/issues with the patients that come from that community.*
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. *This project will primarily be using CHWs and Social Workers to help navigate patients.*
c) Connect patients to primary and preventive care. *The impetus of this program is focused on connecting patients to PCP/PCMH*
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management. *Through connecting patients to a Baylor Clinic PCMH, these services for chronic care management will also be addressed.*
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures
The milestones and metrics that we chose are directly related to two of the goals identified by the region: 1) need for more care coordination and 2) overuse of ED services. The metrics we have in place increase the number of the target population served over the Waiver period and emphasize the connection rate to a PCP/PCMH. In addition, we have added a metric that creates regular reports that show comparative analyses year over year of the program. We believe by running detailed reports on what services were provided and how these coincide with the needs of the community, will allow for maximum effectiveness and positive outcomes of the project. These metrics directly impact the health and well-being of the patients served and ensure continuity in their care.

Unique community need identification number the project addresses
CN.12- ED Utilization and Readmissions

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funds and is a new initiative. It is focused on reducing high cost utilization of the ED setting and connects patients with a PCP/PCMH to avoid subsequent ED visits. This is a low cost, highly effective way to keep patients in appropriate care settings to manage their needs.

Related Category 3 Outcome Measures
The Standalone and Non-standalone metrics come from 2 different domains because the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

Outcome Measure #1: IT-9.2 ED appropriate utilization (**Standalone measure**). According to the Community Health Needs Assessment of Region 9, 68% of the ED visits in the region were for non-emergent situations that could have been handled in the primary care/outpatient settings. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED[246].

Outcome Measure #2: IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (**Non- standalone measure).** Financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[247]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region. On a more global level, AHRQ found that the average cost in 2006 for an uninsured patient stay in the hospital cost about $19,400. There is definite room for opportunity to produce cost savings for this population.[248]

Relationship to other Projects
121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
The navigation program is located in the hospital and will facilitate the connection of patients to the Baylor Clinic that are identified by the staff to not have a PCP/PCMH.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives
Care Coordination models require an initial connection but also require resources to triage patients to. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the Region's responsibility to ensure there are outlets for these patients to receive the care they need. Care Navigation programs serve the patients located in the specific EDs/inpatient units of the performing providers and thus do not duplicate patients on a per visit basis. While our geographies overlap, these programs are localized to individual hospitals. The projects in RHP 9 to enhance patient navigation programs include the following:

Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation
Baylor Health Care System spans over 3 Regional Healthcare Partnerships. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. ***Baylor Medical Center at Irving*** has computed the value

of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as the underserved/uninsured patients that do not have a PCP/PCMH that present in our ***Baylor Medical Center at Irving*** *ED or inpatient units.* We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is connected to community and primary care resources, they can find ways to manage their illnesses on a daily basis and have a contact for their care needs. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe this to be the correct number because, when a person is positively impacted, their ED utilization decreases, community resource burdens are relieved and a greater number of people have a PCMH.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.12.2 – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs- Vulnerable Patient Network (Home Visit Program)

RHP Project Identifier: 121776204.2.4 – Pass 2
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will provide in-home visits to the highest risk uninsured and Medicaid patients. Risk is defined by patient propensity of complications, (re)admissions, downstream healthcare utilization and costs within the parameters of socioeconomic and clinical risk indicators. The team will be led by an APRN overseen by a Medical Director and augmented with a Social Worker, LVN and Care Coordinator who will have overall oversight and responsibility of continuity of care for the patients in the program. Services such as examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education will be available in the patient's home. This project is a new initiative at Baylor Medical Center at Irving.

Need for the project: High risk and complex patients that need intensive management will receive care in their homes to address acute and chronic needs. This should facilitate fewer visits to the ED, greater compliance to clinical protocols and regimens and create improved quality outcomes.

Target population: The top 5% highest risk patients of the 872,000 uninsured and Medicaid population in Dallas County that have at least one of the following characteristics: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide care to 50 high risk patients.

Category 3 outcomes: Category 3 outcomes for this project focus on identifying and improving impediments to patient care in order to increase compliance and better outcomes.

- IT-10.1: Quality of Life. Our goal is to increase the mean score (from time of enrollment to current survey) on QOL assessments by 7% by DY5 for patients in the program for 6+ months.

- IT-10.2: Activities of Daily Living. Our goal is to increase the mean score (from time of enrollment to current survey) on ADL assessments by 7% by DY5 for patients in the program for at least 6 months.

Project Description

The Vulnerable Patient Network (VPN) program provides home visits to the highest risk (clinically, economically and socially) and vulnerable Medicaid and uninsured patients. Using a combination of the Hot Spotting model developed by Dr. Jeffery Brenner of the Camden Coalition of Healthcare Providers[249] and a validated risk stratification tool, we will stratify and identify the top 5% of high risk patients in the Medicaid and Uninsured population. Qualifiers for enrollment in this program include patient characteristics that include but are not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting. A multidisciplinary team comprised of an advanced nurse practitioner (APRN) and LVN to see patients in the home and provide acute, primary and chronic care. In addition, social workers will be part of the team to address barriers to care and any social issues. Care Coordinators will also be part of this team to facilitate coordination and continuity of care for patients and have high level oversight for patients; bringing together the necessary components of care for these complex patients. Lastly, a Medical Director will have management over the entire project. A full spectrum of services will be available in the patient home ranging from examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education.

Goals and Relationship to Regional Goals

The goals for this project are: 1) Increase patients who receive primary care, 2) Overcome access issues for high risk patients, 3) Address acute care issues in the patient's home rather than the Emergency Department, 4) Increase patient compliance and adherence to regimens, 5) Decrease barriers to care around receiving medications and overall care, 6) Increase contact rate with provider for high risk patients and 7) Increase medication reconciliation frequency.

Two of the goals for the region include increasing healthcare capacity and decreasing ED utilization and readmissions. This project increases access to care for those high risk patients who are unable or unwilling to be seen in primary care office. It creates additional points of care for patients to receive care and improve compliance and clinical outcomes. Patients who have multiple chronic diseases and unable to go to appointments can have their conditions proactively managed in their homes. Together long term disease management and avoidance

[249] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011.

of exacerbations lead to better clinical outcomes, lower ED utilization, lower costs and better overall patient health. According to the Community Needs Assessment, the conditions with the highest ED visit volumes for the Medicaid and uninsured population were: diabetes, CHF and stroke. With proper and consistent management, these conditions are manageable.[250] The top 10 utilizers of health care services in the region accumulated $26 million in costs.[251] These patients would be candidates for this Home Visit program, identifying them through the "hot spotting" methodology[252] and proactively managing their conditions. This program will help to improve outcomes of chronic diseases and related complications by proactively managing the patient in a setting that is convenient and comfortable for them, hopefully increasing compliance to treatment protocols and medication adherence.

Challenges

High risk (clinical and socioeconomic) uninsured and underinsured patients often have multiple co-morbidities, issues with access and lack of resources to care for themselves. These patients, due to financial and other constraints cannot afford medications, transportation to appointments and may be physically incapable of leaving their homes to receive care. These are the patients that end up having their clinical conditions escalate and end up in the Emergency Department because the lack of adequate and timely primary care. This program would remove barriers to access by providing a full range of clinical and social services high risk patients need in their homes. This also allows the care team to physically survey the patient's living conditions and find inhibitors to help the patient overcome these issues to better care of themselves.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) provide home care to a minimum of 50 patients, 2) improve mean quality of life scores by a 7% over baseline for patients enrolled in VPN for at least 6 months, 3) improve Activities of Daily Living mean scores by 7% over baseline for patient enrolled in VPN for at least 6 months and create a robust, multidisciplinary care team that manages everything for the patient from scheduling appointments, receiving labs/medications to addressing social issues and helping the patient to overcome barriers to care. We expect that ED and inpatient utilization will decrease and this cohort of high risk patients will have improved clinical outcomes and fewer downstream disease complications/issues.

Starting Point/Baseline

The baseline for this project at Baylor Medical Center at Irving does not exist. The program at Baylor University Medical Center has not been rigorously tracked. Approximately 90 patients have been seen over the past 2 years. On average, patients remain in the program for 298 days. Currently, the patient panel for the program includes Medicare patients who, under this project will be transitioned to a different service. Although this project is an extension of the current

[250] RHP 9 Community Health Needs Assessment

[251] RHP 9 Community Health Needs Assessment.

[252] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011

program Baylor Medical Center at Irving has in place, it has many new components (expanded care team, more services, greater frequency of visits, focus on Medicaid and Uninsured, etc).

Rationale

We selected this project because in the populations we serve, many times patients are unable or unwilling to come to the Baylor Clinic to receive the care they need. The Medicaid and uninsured populations have multiple social, economic and other barriers on top of clinical issues that prevent them from appropriately managing their health. This project uses a face to face mechanism whereby patients are monitored regularly and have all of their needs met in a venue that is convenient and comfortable for them. In a recent article in Health Affairs, entitled Six Features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients, Brown found supplementing telephone calls to patients with frequent in-person meetings; occasionally meeting in person with providers; acting as a communications hub for providers; delivering evidence-based education to patients; providing strong medication management; and providing timely and comprehensive transitional care after hospitalizations were characteristics of successful care coordination programs.[253] Our project, the Vulnerable Patient Network incorporates these components into the program and furthers them by adding additional services such examinations and clinical decision making to changing urinary catheters, labs, vaccinations. The team we propose to put in place would be able to address all of these needs in a coordinated and fluid fashion.

Project Components

We plan engage in continuous quality improvement activities such as: identifying project impacts, "lessons learned," opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations.

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on identifying and intervening on high risk patients who are high utilizers of healthcare services and are unable or unwilling to receive care in an ambulatory care setting. There is one point of clarification needed around the target population for this project. We define the target population as the following:

- Numerator: The number of patients enrolled in the program
- Denominator: The number of patients referred from the hospital as identified by Care Coordinators/Navigators as possible candidates based on identified risk factors including but not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting patients' ability to access care in ambulatory care setting

[253] Brown, RS. Six features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients. *Health Aff*. 2012 June; 21(6): 1156-1165.

The reason we selected outcome measures related to Quality of Life and Activities of Daily living was in order to emphasize the importance for the Care Team to identify and assess non-clinical barriers that may be impeding the patient from receiving the optimal level of care necessary to maintain and sustain their health status.

Unique community need identification number the project addresses: CN.3- Healthcare Capacity and CN.12 Emergency Department Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any federal funds and is a new initiative. It is focused on addressing the complex needs of the highest risk patients by bringing care into their homes.

Related Category 3 Outcome Measures

The Category 3 Outcomes chosen for this project are based upon expected improvement for quality of life and activities of daily living. Many of the components included in Quality of Life and Activities of Daily living assessments help the care team to identify barriers to care and increase compliance. Both measures would also help to periodically and regularly assess QOL and ADL measures to keep an updated record of the patient's barriers to care.

Outcome Measure #1: IT-10.1 Quality of Life (**Standalone measure**).

Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[254] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure #2: IT-10.2 Activities of Daily Living (**Standalone measure**).

Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[255] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or barriers that patients may be experiencing.[256] We may need to consider using the Lawton IADL scale for this population as it involves more complex activities such as: shopping, laundry,

[254] Hawthorne, G. The assessment of quality of life instrument: a psychometric measure of health related quality of life. *Qual Life Res.*8(3):209-24 (1999)

[255] Measuring ADLs Across National Surveys: http://aspe.hhs.gov/daltcp/reports/meacmpes.htm

responsibility for own medications, etc.[257] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Relationship to other Projects

121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Patients that are in the Vulnerable Patient Network can come from the Baylor Clinic. Patients that are identified as high risk from the Baylor Clinic are candidates for the VPN program.

Category 4 Population-focused improvements

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations:

The thought here is that if patients receive the care they need they will have improved clinical outcomes and fewer ED or inpatient admissions.
RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.7, RD-1.8, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7, RD-4.1, RD-4.2

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Care Coordination models require an initial connection but also require resources to triage patients to. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the Region's responsibility to ensure there are outlets for these patients to receive the care they need.

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

[257] Lawton, M. Assessment of Older People: Self-Maintaining and Instrumental Activities of Daily Living. *The Gerontologist* 9:179-186.

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community. ***Baylor Medical Center at Irving*** defined the population that will be directly impacted by the project as the underserved/ uninsured patients are considered high risk both clinically and socioeconomically. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe when a person is connected to comprehensive care, available to them in their homes, compliance and outcomes both improve. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *3.* We believe when a person is positively impacted, their ED utilization decreases, community resource burdens are relieved and a greater number of people receive care. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.11.3 – Other Project Option- Evidence Based Interventions that put in place teams, technology and processes to ensure medication compliance and management- Medication Management and Prescription Assistance Program

RHP Project Identifier: 121776204.2.5 – Pass 2
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Provider: Located in the heart of the Dallas-Fort Worth Metroplex, Baylor Irving serves Irving, Las Colinas and the surrounding communities. The not-for-profit 296-bed hospital offers advanced treatment capabilities in cardiology, orthopedics, oncology, digestive disorders, diagnostic imaging, physical medicine and emergency care. Baylor Irving's service area represents a population of 546,000.

Intervention(s): This project will provide medication management and reconciliation services to uninsured and Medicaid patients at the Baylor Clinic on the Baylor Medical Center at Irving campus. Patients who are 150% or below the FPL and/or have chronic illnesses can qualify for prescription assistance. A clinical pharmacist will be responsible for oversight of prescriptions, educate patients about how and why to take their medications and review utilization, appropriateness and efficacy of medications that patients have been prescribed. This project is a new initiative and contributes to creating a complete PCMH for underserved patients.

Need for the project: Non-compliance to medications can lead to complications and clinical exacerbations that are often avoidable with proper management and education. Medications are an important part of a patient's care regimen but can become an impediment to care when issues such as access or cost become prevalent. This project will help to overcome these issues.

Target population: Baylor Clinic patients who have multiple medications, chronic diseases and/or have demonstrated need for prescription assistance. At least 90% of patients served will be Uninsured/Medicaid.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide medication management to 185 patients.

Category 3 outcomes: Category 3 outcomes for this project do not have any baseline data and improvements are based on ranges of current performance.

- **IT-1.2** Annual monitoring for patients on persistent medications - ACE inhibitors or ARBs (Non- standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.4** Annual monitoring for patients on persistent medications– diuretic (Non-standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.

- **IT-1.5** Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)**.** Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.19** Antidepressant Medication Management - (Standalone measure). Our goal is to increase effective acute phase treatment by 5% in DY3 to 15% in DY5 and to increase continuous phase treatment by 3% in DY3 to 7% in DY5.

Project Description

This project option combines project options 2.11.1- Implement interventions that put in place teams, technology and processes to avoid medication errors and 2.11.2- Evidence based interventions that put in place the teams, technology and processes to avoid medication errors. The project option we chose combines the components of both of these project options but focuses on medication management and compliance in the ambulatory setting within the patient's Baylor Clinic PCMH. . Based on current estimates by our providers, we anticipate that more than 50% of patients in the Baylor Clinic have five or more medications. Ensuring that these medications are 1) appropriate, 2) taken correctly, 3) managed and 4) accessible will be important to improve clinical outcomes. By combining two of the project options 2.11.1 and 2.11.2 to create an "other" option encompasses both a process for avoiding medication errors and evidence based interventions to avoid medication errors. We intend to utilize a clinical pharmacist who will review patient mediations for those patients who have multiple prescriptions on a regular basis to ensure that medications are appropriate and to ensure the patient understands how and why they are taking the medications. Additionally, we plan to help patients obtain the medications they need through implementing a prescription assistance program to help patients who are eligible, qualify for mediations and provide medications to those patients who cannot afford prescriptions. We will attempt to provide medications at little to no cost for patients who are 150% below the federal poverty level, have one or more chronic diseases and remain compliant with their appointments and care regimens. Through this benefit and clinical pharmacist oversight and management, we expect adherence and compliance to medications will increase. The additional advantage to embedding this team within the PCMH is that patients will receive comprehensive care management to address all of their needs in one care venue.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to provide prescriptions at little to no cost for patients that qualify or help patients enroll in programs to receive their medications, 2) provide clinical pharmacist oversight to ensure that medications are appropriate and adhered to, 3) patients understand their medications and reasons for taking them 4) improve clinical outcomes related to adhering to a medication regimen. The regional goals around managing chronic disease, ED utilization and behavioral health are all addressed through this project. Managing medications has ancillary effects on outcomes of multiple regional goals. If patients have access to and adhere to their prescriptions, chronic diseases and behavioral health issues would be under better control and there would be fewer exacerbations and visits to the ED. This program is also

a mechanism to improve cost savings for the region through monitoring utilization, finding generic prescriptions where appropriate and avoiding costly complications and expensive ED/inpatient utilization.

Challenges

Challenges with the underserved population and medication management pose one of the most difficult hurdles to overcome in their care. First, the uninsured and Medicaid populations are highly transient and may not maintain the same PCMH for an extended period of time. This causes gaps in their medication regimen and can often lead to clinical exacerbations. Another challenge is access to medications and affordability. Patients who do not live near a pharmacy to fill their prescriptions or cannot afford to fill them will forgo this part of their care or ration the medications they have, leading to complications and escalations in their conditions. One trend we have seen in RHP 9 is indigent patients will go from ED to ED across the region to receive pain medications and because there is little coordination between hospital systems, there is no consistent record of the medications these patients receive. Lastly, patients that are polypharmacy often do not understand how to take their mediations appropriately or understand why they need the prescription at all. This lack of understanding also leads to non-compliance. With this project, we plan to address these challenges by providing medications at little to no cost for those patients that qualify, help patients that are eligible get on prescription assistance programs, provide prescriptions in the Baylor Clinic or nearby on the Baylor campus and offer clinical pharmacist oversight to monitor the patients' prescriptions and encourage compliance to a medication regimen.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 185 patients with medication management in a PCMH setting, 2) increased frequency of medication reconciliation and management, 3) greater literacy around medication regimens and purposes, 4) efficient and effective utilization of medications for patients and 5) make the clinical pharmacist part of the PCMH care team. We through proactive management of mediations for the uninsured and Medicaid populations that clinical outcomes will improve, there will be fewer exacerbations of patient diseases.

Starting Point/Baseline

Baylor clinics have not historically provided any type of formal medication management or prescription assistance type program to patients. This is a new program that will be offered. We anticipate that on average about 5% of Baylor Clinic patients will need medication management services. Based on historical data, almost 50% of patients have five or more prescriptions. We anticipate that on average about 5-10% of high risk Baylor Clinic patients will need focused and frequent medication management services. We will have to establish the baseline in DY2 for the particular medications mentioned in the Category 3 outcomes and to determine the scope of high risk and polypharmacy patients.

Rationale

We selected this project for multiple reasons: 1) to offer a complete suite of services to patients in a Baylor Clinic PCMH ranging from chronic disease and behavioral management, basic primary care, specialty care and medications, 2) provide regular medication management and reconciliation to ensure appropriate utilization and adherence to prescriptions, 3) improve clinical outcomes by enforcing a medication regimen with patients and 4) improve adherence to medications by offering assistance in obtaining them. Successful programs that focus on coordinating care for patients include a medication management component.[258] Our overall goal is to create a PCMH for uninsured and Medicaid patients that is comprehensive and has co-located services to allow for greater convenience and compliance for patients. The total economic impact of medication non-adherence — which contributes to costly health complications, worsening of disease progression, and preventable utilization — has been estimated to be as much as $290 billion.[259] For patients with diabetes, those with low levels of adherence have almost twice the total annual healthcare costs of those with high levels of adherence ($16,498 versus $8,886).[260] The New England Healthcare Institute cited four components to improving medication management: 1) creating health care teams, 2) patient engagement and education, 3) payment reform and 4) leveraging health information technology.[261] This project addresses all of these components by 1) integrating the clinical pharmacist into the PCMH team, 2) educating the patient on why and how to take their medications, 3) offering prescription assistance and little to no cost medications for those who qualify and 4) using the Baylor Clinic electronic health record to monitor prescription regimens, fulfillments and utilization. There have been studies published stating that giving patients medications for free does not promote utilization and adherence.[262] In a study published in the New England Journal of Medicine, insured patients who were discharged from the hospital and had their prescriptions fully covered still only had adherence rates of 40-50%.[263] We will control for this in two ways: 1) we will not offer prescriptions for free unless the patient is 150% or below the FPL and/or has at least 1 chronic disease and 2) we will require that a patient is seen regularly in the Baylor Clinic to continue to receive their medications.

Project Components

We have chosen applicable components from project options 2.11.1 and 2.11.2 to create our project around medication management

[258] Brown, RS. Six features of Medicare coordinated demonstration programs that cut hospital readmissions of high risk patients. *Health Aff*. 2012 June; 31(6):1156-1165.

[259] McKethan, A and Benner, J. Seizing the opportunity to improve medication adherence. *Health Aff.* 2012 August.

[260] New England Healthcare Institute. Thinking outside the pillbox: a systemwide approach to improving medication adherence for chronic disease. 2009 August.

[261] New England Healthcare Institute. Thinking outside the pillbox: a systemwide approach to improving medication adherence for chronic disease. 2009 August.

[262] McKethan, A and Benner, J. Seizing the opportunity to improve medication adherence. *Health Aff.* 2012 August.

[263] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

a. Develop criteria and identify targeted patient populations that are at high risk for developing complications, co-morbidities and/or utilizing emergency care services: *We will use our electronic health record to identify polypharmacy patients, patients who are on chronic disease medications and/or are high utilizers of the ED*

b. Develop tools to provide education and support to those patients at highest risk of an adverse drug event or medication error. *The clinical pharmacist we use for this program will help to educate the patient on these topics. We will ensure that materials are multilingual as well.*

c. Conduct root cause analysis of potential medication errors or adverse drug events and develop/implement processes to address those causes: *As one of our metrics, we will be designing the workflow for the clinical pharmacist and we will add this component into plan*

d. Implement pharmacist led chronic disease medication management services in collaboration with primary care and other healthcare providers: *The clinical pharmacist will be co-located in the Baylor Clinic and will interface with the PCMH team on a regular basis*

e. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on increasing the number of patients who receive medication management services and by having outcomes that specifically focus on medications, this will encourage the care team to manage and monitor medications more frequently and with higher scrutiny. Although medication management is part of the patient's overall care in a Baylor Clinic, these milestones, metrics and outcomes will put a greater emphasis on ensuring that mediations are appropriate, regularly reconciled, adhered to and are utilized in order to improve clinical outcomes for patients. The outcome measure medications that we chose: ACE/ARB inhibitors, diuretics, anticonvulsants and antidepressants are drugs that are regularly used by our Baylor Clinic patients. Since many of

our patients have hypertension and CHF, adherence improvement to these drugs will help to facilitate better outcomes.

Unique community need identification number the project addresses:
CN.11 Patient Safety and Quality and CN.4 Primary Care and Pediatrics

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funds and is a new initiative. It is focused on providing prescriptions for patients in need and ensuring that utilization of these prescriptions is appropriate and (cost and clinically) effective.

Related Category 3 Outcome Measures
The Category 3 outcomes for this project focus on medication management and monitoring for specific drugs that many of our Baylor Clinic use. These medications are also associated with complex chronic diseases and behavioral health issues. These drugs are an important part of a patient's care regimen to keep their conditions well controlled.

Outcome Measure #1: IT-1.2 Annual monitoring for patients on persistent medications angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (Non-standalone measure).
Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to antihypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[264] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure #2: IT-1.4 Annual monitoring for patients on persistent medications–diuretic (Non- standalone measure)
Approximately 33% of Baylor Clinic patients on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[265]

[264] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

Outcome Measure #3: IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)
Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[266] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure #4: IT-1.19 Antidepressant Medication Management - (Standalone measure)
Approximately 20% of Baylor Clinic patients on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the region. The top 10 utilizers in the region had behavioral health related issues.[267] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[268]" Our project supports this methodology.

Relationship to other Projects

121776204.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This medication management and prescription assistance program will be available to patients who are Baylor Clinic patients. The program will be incorporated into the overall care team and management of the patient.

Category 4 Population-focused improvements

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations: The thought here is that if patients take the appropriate medications in the right dose and correct regimen, the following improvements can be expected:
RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.8, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7, RD-3, RD-4.1, RD-4.2

TBD

Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor Medical Center at Irving defined the population that will be directly impacted by the project as the underserved/uninsured patients that need prescription assistance and medication management services that are patients at a Baylor Clinic PCMH on the ***Baylor Medical Center at Irving*** campus. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is on the correct prescription and on an appropriate medication regimen, they are better able to manage their illnesses and have better clinical outcomes. To determine the value to the community of each, we concluded that, on a scale of 1 – 5, the value of this project is a *3.* We believe this to be the correct number because, when a person is positively impacted, unnecessary drug utilization decreases, patients are able to become well and resume being active and productive members in society.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the

weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.2.2 – Expand Chronic Care Management Model - Create Chronic Disease management and Prevention Program

RHP Project Identifier: 139485012.2.1
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is a nationally recognized hospital that cares for more than 300,000 people each year. It is a major patient care, teaching and research center for the Southwest. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): The project purpose is to provide focused education and point of care testing for underserved patients who have diabetes, CVD and/or Respiratory disease that are in need of education, clinical management and training within a primary care setting. We will co-locate primary care and chronic disease management services to improve clinical outcomes. This project is new because it will provide CHF and Asthma education and point of care testing, all which have not been done before. We have had some Diabetes education in our Clinics but not a formal and focused program for the Medicaid/Uninsured population.

Need for the project: One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease. Components of patient education and helping patients to understand their illness, how to better manage it, how to coordinate their lifestyle choices and offering point of care testing in order to achieve optimal health outcomes are essential in population management of chronic disease

Target population: Approximately 275,000 individuals in Dallas County have Diabetes. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. The underserved segment of this population is who we will target.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide chronic disease education and point of care testing for 2073 patients in the Dallas area. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends of metrics that had material impact on patients in a 2-3 year time period.

- IT-1.10: Diabetes Care: HbA1c Poor Control. Our goal is to decrease the number of patients with uncontrolled HbA1cs (> 9.0%) from 17.4% currently to 14.9% (or 2.5% improvement over baseline) in DY5.

- IT-1.11: Diabetes Care: BP Control (< 140/80 mmHg). Our goal is to increase the number of diabetic patients in good BP control (< 140/80 mmHg) from 49.4% to 56.6% (or 7.2% improvement over baseline) in DY5.

- IT-1.13: Diabetes Care: Foot Exam. Our goal is to increase the number of diabetic patients who receive foot exams from 86.8% currently to 90.4% (or 3.6% improvement over baseline) in DY5.

Project Description

The Baylor Clinic on the Baylor University Medical Center campus, would house a carved out chronic disease management program to provide focused and dedicated education and care for (Uninsured and Medicaid) patients with Diabetes, Cardiovascular Diseases (CVD) (i.e.: Congestive Heart Failure) and Respiratory Diseases (Asthma/Chronic Obstructive Pulmonary Disease) within a primary care setting. We expect that this program's participants will be 85-90% Medicaid/Uninsured patients. Specific staff, comprised of CHWs and Nurse Care Managers, would address the complex clinical and prevention needs of these patients and spend time specifically on management of these diseases. The focus of this time and education with patients would not only entail clinical counseling, but also include prevention components to focus on lifestyle issues and self-management. The other key advantage that patients will receive as part of this program is point of care testing for Diabetes (HbA1c testing and glucose testing using test strips) and Asthma (Peak Flow Meter Assessments). We believe this will overcome the barrier of patients' non-compliance with completing lab orders and any financial or transportation issues that would arise in obtaining these important lab results.

We plan to leverage the expertise and experience of both the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) and Baylor Clinics to provide staff education, develop competencies, and create protocols that will result in a complete and robust program tailored for multiple community settings. The Diabetes Health and Wellness Institute would house this staff and appropriately triage and manage providers to see patient at Baylor Clinics based on volume and demand parameters. Baylor Clinics have had previous success in managing patients with chronic disease through the creation and development of a community health worker model (CHW). These successes and competencies will be leveraged to create programs around CVD and Respiratory illnesses.

Goals and Relationship to Regional Goals

The project goals for this program include: 1) increasing health literacy around chronic illnesses for patients in the community, 2) educate and teach self-management techniques for patients to manage their chronic diseases, 3) augmenting RN care managers with CHWs to serve a greater number of patient through a carved out, focused care model, 4) increasing the number of patients who are screened and monitored for their chronic diseases using point of care testing and 5) increase education for patients with CHF and Asthma/COPD (2 disease states previously not offered). The purpose for performing a project in this area is to help identify

patients with chronic diseases and provide them with treatment and education in a proactive fashion so that downstream complications can be avoided and ED/inpatient utilization can decrease.

One of the major identified by the Community Health Needs Assessment for Region 9 included Chronic Disease[269]. Components of patient education and helping patients to understand their illness, how to better manage it and how to coordinate their lifestyle choices to achieve optimal health outcomes are essential in population management of chronic disease. This project coincides with this need and focuses on education, lifestyle management, proactive counseling and decision making and clinical improvement. This leads to lower ED visits for acute issues related to chronic diseases and helps patients utilize costly services in the Region.

Challenges

Underserved patients experience multiple barriers to effectively manage their chronic illnesses. These include lack of knowledge, lack of social support, poor diets, insufficient physical activity, and limited access to care due to financial and transportation issues. By co-locating the chronic care management program within the primary care clinic, patients can receive medical care and chronic disease support at the same time. Additionally, the PCP's medical management is informed by the chronic care management team's interactions with the patient, which, in our experience, elicits new information regarding lifestyle and barriers to health. The RN/CHW model will be structured so that patient education is delivered in a format and context that is understandable and enjoyable for the patient. Lastly, the education and counseling will include lifestyle and self-management techniques so that this population can find ways to care for themselves that is relevant to their daily lives.

5-year Expected Outcome for Provider and Patients

The expected 5-year outcomes are that: 1) at least 2073 patients will have served by the Chronic Care Management model at the Baylor Clinic, 2) we expect better clinical outcomes around HbA1c, foot exam completion and BP control, 3) more patients in the community will have had a point of care test completed for their diabetes or asthma which will provide real time results and opportunities for improvement for the patient and provide, 4) increase literacy in the community around chronic diseases and 5) decrease rates of avoidable/unnecessary complications (i.e. amputations) due to chronic diseases.

Starting Point/Baseline

Currently, the Baylor Clinic on the Baylor University Medical Center offers a limited program focused on diabetes education. Of the patients enrolled in the program, approximately 17% of clinic patients have an HbA1c > 9.0. This baseline is not directly comparable to the proposed project for chronic care management because we will be including CHF and Asthma/COPD patients as well as part of the initiative. We estimated a target population based on the Community Health Needs Assessment, 11.4% of all Dallas County residents have diabetes, this equates to almost 275,000 individuals in the county. Literature shows that diabetes is more

[269] RHP 9 Community Health Needs Assessment

prevalent in the underserved community[270]. 19.6% of Dallas County has Asthma, which equates to 473,000 people. CHF accounts for about 200 deaths per 100,000 individuals in Dallas County. These statistics do not take into consideration any intersection of CHF, Asthma and Diabetes which makes individuals more complex and high risk. [271] Our project will serve approximately 2073 new patients of this population.

Rationale

We selected this project option because of the prevalence of chronic disease in the underserved population. Through co-locating primary care, behavioral health and chronic disease management services, we can improve clinical outcomes. By increasing the availability of chronic care services and utilizing a team based approach, more patients can receive focused attention for their complex needs and learn to self-manage their illnesses in an effective way. We have demonstrated statistically significant reductions in mean HbA1c measures with a CHW model currently embedded in Baylor Clinics[272]. Thus expanding educational services to serve more diabetes patients, and beginning to serve CHF and Asthma/COPD patients is a logical next step in improving the care of the population. The Community Health Needs Assessment identified the top 5 most prevalent conditions as: stroke, diabetes, CHF, failing kidneys and AMI. This project addresses 2 of these directly and 2 indirectly, it aligns exactly with the needs of the Region and the challenges that have been identified.[273]

Project Components

We will engage in continuous quality improvement activities throughout the duration of the project such as: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to continuously integrate the chronic disease management program into the care team as much as possible.

Reasons for selecting outcome measures

The Chronic Care Management metrics and milestones we have chosen focus on finding the appropriate model that would be effective in Dallas County that also addresses multiple chronic illnesses. Based on the complexities of the underserved population, we structured our metrics to focus on increasing access, awareness and education for individuals in the region and in the latter years including metrics around increased compliance to recommended clinical protocols. We believe it will take time for patients to understand and epitomize good self-management behaviors and it will also take times to see marked clinical outcome improvements. We do anticipate some clinical improvement for those patients that have been engaged in the chronic care management program for an extended period of time. We have not historically completed programs for CHF and Asthma/COPD and will use this opportunity to create a continuous

[273] RHP 9 Community Health Needs Assessment

improvement environment where these programs can be refined and modified as we gather more experience.

Unique community need identification number the project addresses:
CN.8: Chronic Disease and need for chronic disease management

How the project significantly enhances an existing delivery system reform initiative
We currently do not receive any federal funding for chronic disease education and providing services for CHF and Asthma/COPD are new to the Baylor Clinic. This project coincides with the need to focus on chronic illnesses, as they are the main drivers of health care costs in the US. Diabetes alone costs the US almost $174 billion dollars a year. [274]

Related Category 3 Outcome Measures
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Outcome Measure #1: IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (**Standalone measure**). In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes with more than 32% of the population classified as obese and at risk for developing Diabetes[275]. Traditionally, the underserved population does not have access to the necessary medications, education and supplies to manage their diabetes, thus many times patients go undiagnosed or have poor glucose control. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels Bodenheimer, et al., found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients[276]. A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[277]. Focusing efforts on increasing improvement of good glycemic control will result diminishing in other co-morbid conditions and improve complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

[274] http://www.diabetes.org/diabetes-basics/diabetes-statistics/
[275] RHP 9 Community Health Needs Assessment

[277] MenzinJ, Korn, J, Cohen, J, et.al Relationship between glycemic control and diabetes related hospital costs in patients with type 1 or type 1 diabetes mellitus. J Manag Care Pharm. 2010; 16(4):264-275.

Outcome Measure #2: T-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (**Standalone measure**). At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et al. showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[278]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic. Again, similar to HbA1c, we expect modest improvement in BP in years DY4 andDY5 contingent upon patient participation in the clinic and chronic disease program. Our primary goal will be to have patients come in for basic services and chronic disease education.

Outcome Measure #3: IT-1.13 Diabetes care Foot exam- NQF 0056 (**Non- standalone measure**).An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations,

Relationship to other Projects

139485012.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This chronic care management project is related because: 1) services will be co-located and 2) the chronic care team will be integrated with the primary care team to facilitate complete care and efficiency for the patient.

139485012.2.3- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment
The project involving developing care management functions to integrate primary and behavioral health needs of individuals is related to this project of chronic care management because often times patients have co-occurring chronic disease and mental health issues which require attention. These programs can cross-refer depending on the patient's needs.

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor University Medical Center defined the population that will be directly impacted by the project as underserved patients who have Diabetes, Asthma, and/or CHF that are in need of education and treatment. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this to be the correct number because, when a person is positively impacted, she increases her ability to self-manage her illness(es) and maintain her health rather than relying on the physician or ED to manage her conditions. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this to be the correct number because, when a person is positively impacted, his propensity to understand his illness, share his knowledge with others and help spread health literacy

increases. Patients learn to manage their illnesses and escalations themselves rather than relying on expensive resources such as the ED.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.19.1 – Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals-Behavioral Health Counseling, Screening and Treatment

RHP Project Identifier: 139485012.2.2
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is a nationally recognized hospital that cares for more than 300,000 people each year. It is a major patient care, teaching and research center for the Southwest. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will co-locate and integrate outpatient behavioral health services using an LCSW to provide counseling services. Screenings for depression, substance abuse and anxiety will also be an integral part of the program. This is a new project that has not been done before. It will serve the BH needs of the Uninsured/Medicaid population.

Need for the project: The RHP 9 Community Needs Health Assessment identified behavioral and mental health issues are a large unmet need in most counties within the region and also identified as the most difficult to access services in the Region. Behavioral Health issues are an identified impediment to clinical adherence and when addressed can create a material impact on clinical outcomes. Behavioral Health issues are especially prevalent in the underserved populations.

Target population: Underserved (Medicaid and uninsured) population in the Dallas area with behavioral health issues.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide screening and interventions to 2073 patients in the Dallas area. Approximately 85-90% of these patients will be Medicaid/Uninsured.

Category 3 outcomes: Category 3 outcomes for this project were chosen because: 1) the ambulatory setting of the project and 2) historical trends /literature based metrics that had material impact on patients in a 2-3 year time period.

- IT-11.1: Improvement in Clinical Indicator in Identified Disparity Group: Improvement in Diabetes Metrics (HbA1c, LDL, BP) for disparate group of uninsured/Medicaid patients with an underlying BH issue. Our goal is to have 5% of patients in DY3 achieve improvement in Diabetes Metrics (HbA1c, LDL BP), 10% in DY4 and 15% in DY5.
- IT-11.3: Improve utilization rates of clinical preventive services in target population with identified disparity: Improve utilization of BH services for patients who have been

screened/identified and diagnosed with an underlying BH issue. Disparate population is underserved population with BH issue. Our goal is to increase the patients who engage in BH treatment rates from 10% in DY3 to 20% in DY5.

Project Description

This project will co-locate and integrate behavioral health services into the outpatient primary care setting. The model that we aim to develop would consist of providing a LCSW to provide basic counseling services to address behavioral health needs such as: anxiety, depression, and substance abuse issues. The screening tools we plan to use are evidence based and will most likely include: PHQ2 or 9, GAD-7 and alcohol and substance abuse screeners. Additionally, the LCSW would have the support of a Community Health Worker (CHW) to help with the screening and referral processes. The training for the CHWs ,LCSWs and model development would occur at the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) where the competencies and expertise would be created. From there, this staff can be triaged to clinics and community locations to provide behavioral health services. The behavioral health program would require that the LCSW and CHW to work together with the primary care team to: 1) identify the patients who have behavioral health issues, 2) coordinate the patient's care and appointments to fit both the behavioral health and primary care appointment in the same visit and 3) help the primary care team to identify those patients whose behavioral health issues are impeding the management of their acute/chronic disease management models. We anticipate that approximately 85-90% of these patients will be Medicaid/Uninsured.

Goals and Relationship to Regional Goals

The goals of this project are to increase the baseline of behavioral health services provided and screenings conducted to the underserved population in Dallas County received in an outpatient setting. By co-locating the behavioral health service with a patient's PCMH, we anticipate that compliance and adherence to attending behavioral health appointments will increase. Through increased screening, awareness and intervention, we also anticipate that behavioral health issues such as anxiety, depression and substance abuse will be proactively identified and addressed in order to allow the clinician and patient to focus on more acute/chronic illnesses that require protocol adherence. The derivative goal of this would also be to decrease ED visits related to behavioral health issues that are manageable in the outpatient setting. We believe by treating the underlying barriers associated with behavioral health, this will result in better health outcomes for this population. The RHP 9 Community Needs Health Assessment identified behavioral and mental health issues are a large unmet need in most counties within the region and also identified as the most difficult to access services in the Region. There were three regional priorities around behavioral health including integrating behavioral health with primary care and addressing behavioral health in other settings. More than 10% o f Dallas County residents "binge drink" and there are more than 10 deaths per 100,000 related to suicide[279]. Only 19% of patients receive behavioral health and primary care services in the same

[279] Healthy People North Texas: http://www.healthyntexas.org

setting[280]. The most compelling statistic is that 100% of the 10 most frequently admitted patients had a co-occurring behavioral health diagnosis. The aforementioned statistics make a strong and significant case that basic behavioral health services can achieve "quick wins" for this underserved population. This project is directly aligned with the Regional needs and is positioned to help facilitate care related to substance abuse, anxiety and depression[281].

Challenges

The challenges with behavioral health initiatives are that identification of patients and willingness of those patients to participate in a formal program do not coincide. There is a stigma associated with receiving counseling or behavioral health services which makes it difficult for providers to identify patients that have these underlying behavioral health issues and even more difficult for providers to get patients to come in for these types of appointments. In the community, patients do not see their behavioral health issues as a medical condition, thus the problems are often ignored and results in these patients using the ED for their acute behavioral health escalations. While this program would not focus on serious psychiatric issues such as schizophrenia or bipolar disorders, identifying depression or anxiety can have a significant impact on the patient's propensity to comply with medication and clinical recommendations/protocols. The way we plan to address the challenges mentioned above is through providing these services in a non-threatening way by individuals (CHWs/LCSWs) that come from the community they are serving. By using CHWs or LCSWs over physicians or other higher level providers, this should put the patient at ease. The program will also be presented in a counseling type environment rather than a psychiatric evaluation environment. Lastly, we will make behavioral health screenings a routine part of most primary care visits so that the assessments coincide with the patient's typical care.

5-year Expected Outcome for Provider and Patients

The 5 year expected outcome is that at least 20% of the total unduplicated patients (approximately 2073 patients) will receive behavioral health services at the Baylor Clinic. By identifying underlying behavioral health issues, acute and chronic medical issues can be addressed and compliance/adherence to clinical protocols should increase as well.

Starting Point/Baseline

There is no baseline for this project because there are no initiatives for behavioral health that are offered or ever have been at the Baylor Clinic located on the Baylor University Medical Center. This is a brand new program that will be administered to Clinic patients. We do know that the target population in the Dallas county area is over 200,000 underserved individuals who suffer from a mental illness. We calculated this number taking the uninsured population in Dallas County (872,000)[282] and a 2011 statistic taken from the Centers for Disease Control and Prevention that found 23% of uninsured patients suffer from a mental illness.[283]

[280] RHP 9 Community Health Needs Assessment

[281] Healthy People North Texas: http://www.healthyntexas.org

[282] http://quickfacts.census.gov/qfd/states/48/48439.html

[283] CDC: http://www.cdc.gov

Rationale

The reasons for selecting this project option are because behavioral health was not only identified as a major regional need, but Baylor Clinics have the infrastructure to effectively manage these types of issues within its PCMH framework. Many of our patients have underlying behavioral health issues which the physicians simply do not have time to address during a typical primary care visit, this model would allow patients to receive personalized attention for their behavioral health specific issues and allow the physicians to spend time on managing clinical issues. We believe by implementing a behavioral health component as part of the PCMH we have established, that patients will have improved overall health outcomes and providers will have greater satisfaction because these services will be performed by individuals who have an expertise in managing behavioral health issues. Lastly, we believe adding a behavioral health component to our primary care team will allow for cross communication between providers to understand all of the complex needs that are prevalent in this particular population.

Project Components

This behavioral health project has many components, all of which are addressed below:

a. Conduct data matching to identify individuals with co-occurring disorders who are:
    - not receiving routine primary care-*Patients who enter in to the behavioral health program will be automatically part of a PCMH*
    - not receiving specialty care according to professionally accepted practice guidelines: *We will be tracking this metric as part of our specialty care project- 1.9.2- Improving Access to Specialty Care*
    - over-utilizing ER services based on analysis of comparative data on other populations: *This is a metric that we already track and will continue to do so*
    - over-utilizing crisis response services. *This particular factor may be difficult to gather data on and is not typically a data point we collect*
    - Becoming involved with the criminal justice system due to uncontrolled/unmanaged symptoms. *This particular factor may be difficult to gather data on and is not typically a data point we collect*

b. Review chronic care management best practices such as Wagner's Chronic Care Model and select practices compatible with organizational readiness for adoption and implementation. *We plan to review the most effective models that address both chronic care and behavioral health to determine which model would easily address the intersection of both programs*

c. Identification of BH case managers and disease care managers to receive assignment of these individuals: We plan on hiring LCSWs and CHWs to act as BH care managers

d. Develop protocols for coordinating care; identify community resources and services available for supporting people with co-occurring disorders: As part of identifying which patients would be eligible and appropriate for this BH program, we will develop clinical protocols to identify patients and coordinate their care within the Baylor Clinic PCMH

e. Identify and implement specific disease management guidelines for high prevalence disorders, e.g. cardiovascular disease, diabetes, depression, asthma. *We plan to address this criteria through our Chronic Care Management project (2.2.1- Expand Chronic Care Management Models)*

f. Train staff in protocols and guidelines. *All staff will be made aware of this program and be trained on scheduling and identifying patients who could be part of this BH program*

g. Develop registries to track client outcomes. *We currently have a robust E.H.R in which we track other patient clinical metrics and measures, it would be redundant and inefficient to create a separate registry to track outcomes of this specific project. We intend to track outcomes in the current E.H.R.*

h. Review the intervention(s) impact on quality of care and integration of care and identify "lessons learned," opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. *As part of our monthly review of project status, this will be included as will review of the other DSRIP projects the Baylor Clinic will be engaged in. We will focus on the key challenges associated with expansion and determine how and if the BH needs to be scaled to meet patient needs.*

Reasons for selecting outcome measures

The milestones and metrics chosen are focused on increasing volumes of patients seen. In order to be effective, patients will need to attend their appointments and be compliant with the recommended guidelines for their behavioral health issues and subsequent medical issues. In order to achieve the proposed metrics and milestones all of the other DSRIP projects will have to coordinate and synchronize in order to fulfill the metrics chosen. This will be advantageous to the Region, as it will create synergy and a complete plan of care for the patients in the target population. In the Planning Protocol, there were no options for Improvement Milestones that were directly applicable to this Behavioral Health program. Many of the metrics were focused on chronic disease, which we have an entire separate DSRIP project dedicated to. Thus, we created two customizable improvement milestones that focus on 1) increasing patient volumes (capturing eligible patients) and 2) improving rates of screening for anxiety, depression and substance abuse.

Unique community need identification number the project addresses:

CN.5- Behavioral Health ,CN.6-Behavioral Health and Primary Care

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funding and is a brand new initiative. There is currently no outpatient based behavioral health program offered to the underserved population at the Baylor Clinic at the Baylor University Medical Center. This project will provide a low cost, effective intervention to patients with behavioral health needs in a manageable setting for providers to identify potential escalation points related to behavioral health issues.

Related Category 3 Outcome Measures
Category 3 metrics for this project were identified using literature only. Baylor has no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Outcome Measure #1: IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (**Standalone measure**). We plan to measure the impact of diabetes management and control for patients who have enrolled in the proposed behavioral health program. A recent study conducted in early 2012, by Jeffery Johnson, et. al showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression[284]. Depression is associated with poorer self-care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.

> Numerator: Number of patients with an improved Diabetes Percent of Opportunities Achieved (POA) improvement (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
> Denominator: Total number of patients with a Behavioral Health intervention/encounter

Our Baylor Clinics currently track the Diabetes Percent of Opportunities Achieved (POA) for all patients with Diabetes. This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their diabetic patients than in the prior reporting period. For an illustrative example: For Diabetes- there are 3

[284] Johnson, JA, Sayah, FA, et.al. Controlled trial of a collaborative primary care team model for patients with diabetes and depression: rationale and design for a comprehensive evaluation. BMC Health Services Research. 2012, 12:358

opportunities (i.e. metrics) per patient (1) LDL < 100 (2) A1c < 8 and (3) BP < 130/80 mmHg. The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 76% achievement.

However, adding behavioral health as a subset of measurement for this patient population may change the actual improvement that is attainable. Because this is a new program, we do not have any historical data on the actual Diabetes improvement for those patients who receive a behavioral health intervention. We only have literature which has shown improvement in Diabetes with interventions related to depression. Thus, the improvement targets we have listed for Category 3 may differ as we implement the program.

Outcome Measure #2: IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (**Non-standalone measure**). We plan to focus on the treatment component of this metric, defining treatment as those patients who **engage** in the behavioral health program. We anticipate that patients who enter our Baylor Clinic and are identified as individuals who would benefit from a behavioral health intervention will have improved treatment and utilization rates.
Numerator: patients who are a Baylor Clinic patient and <u>engage</u> in behavioral health program
Denominator: patients who are a Baylor Clinic patient, <u>eligible</u> for behavioral health services
The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure differs from our customized Improvement Milestone I-X: Target Population Reached: Increase Number of patients enrolled in BH program because the Improvement Milestone is focused on increasing volumes of eligible patients. Outcome measure 11.3 takes this one step further to ensure that the patient actually <u>engages</u> in the behavioral health program. By qualifying "engage" as a minimum of two interventions/encounters in the last 12 months, this varies from the Improvement Milestone of just increasing volume.

<u>Relationship to other Projects</u>
139485012.2.2- Expand Chronic Care Management Models- Create Chronic Disease management and Prevention Program. The Chronic Care Management Model project is related because if patients have a co-occurring behavioral health issue and chronic diseases, the services are co-located and patients can be referred into both programs if necessary.

139485012.1.1: Expand existing primary care capacity- Baylor Clinic Capacity Expansion

This behavioral health project is related to the expansion of primary care capacity project because 1) the services will be co-located and 2) the behavioral health team will be part of the overall primary care team; providing complete and efficient care for the patient.

Related Category 4 Population-focused improvements

Many of the behavioral health metrics listed Category 4 are much more intensive than the scope of the program. The intent of the program is to create a counseling mechanism by which underlying behavioral health issues can be addressed. We do anticipate that less severe disease states of mental illness will have decreased ED utilization and with behavioral health issues addressed a possible increase in the compliance to other services/protocols. Impacts to Category 4 include: RD-1.3, RD-1.7, RD-1.8, RD-1.1, RD-1.2, RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.7, RD-3.36, RD-4.1, RD-4.2 RD-5.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Behavioral Health is pressing issue across the Region and will require collaboration and coordination between providers to manage these types of issues in a less costly, personalized setting. Our project differs from the two above because our focus is on counseling and screening. We will focus on disorders such as depression, anxiety and substance abuse.

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same technique across our hospitals. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor University Medical Center defined the population that will be directly impacted by the project as the underserved PCMH Baylor Clinic patients with an underlying behavioral health issue(s). We used the pricing matrix developed by Regional providers to determine the value for each positive outcome. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a ***3.*** We believe this because, when a person is impacted, their compliance and adherence to clinical protocols increases, their satisfaction increases and self-management of their illnesses increases. To determine the value to the community, we concluded that, on a 1-5 scale, the value of this project is ***4.*** We

believe when a person is positively impacted, their productivity in the community increases as mentioned in the Community Health Needs Assessment where 25% of the population reported lost work days due to a mental health issue. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.9.1 – Establish/Expand a Patient Navigation Program - Care Connect

RHP Project Identifier: 139485012.2.3
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is a nationally recognized hospital that cares for more than 300,000 people each year. It is a major patient care, teaching and research center for the Southwest. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will identify and connect underserved patients in the hospital to a PCP/PCMH, create a multi-disciplinary care plan for frequently admitted patients and provide comprehensive follow up calls to patients to ensure they have an appointment and transportation to get to it.

New v. existing initiative: This project would be an expansion of Care Connect at Baylor University Medical Center. We will be adding additional staff to serve more Medicaid/ Uninsured patients add coverage on nights and weekends and create Care Plans for high risk patients.

Need for the project: Connecting patients to a PCP/PCMH will reduce ED utilization and provide outpatient services for complex patients. Over-utilization of the ED was identified as a Regional issue.
Target population: The 872,000 uninsured and Medicaid population in Dallas County without a PCP/PCMH who come to the ED. Approximately 85% of the new patients seen in the program will be Medicaid/Uninsured.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide access to an anticipated 7200 new patients from the community.

Category 3 outcomes: Category 3 outcomes for this project are from 2 different domains the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

- IT-5.1: Improved Cost Savings. Our goal is to increase cost savings of healthcare utilization (total cost of care in one year) of patients who have been connected to a PCP/PCMH appointment from 15% in DY3 to 25% in DY5. .

- IT-6.1: ED Appropriate Utilization. Our goal is to decrease all ED visits (including ACSC) from 25% in DY3 to 35% in DY5 and targeted conditions ED utilization (CHF, Diabetes, ESRD, CVD/Hypertension, BH/SA, COPD, Asthma) from 10% in DY3 to 20% in DY5. We

will be excluding pediatric emergency visits as part of this metric measurement because Baylor Univeristy Medical Center ED does not see a large volume of pediatric patients.

Project Description

This project aims to create a fluid care navigation program located at **Baylor University Medical Center** Emergency Department for patients (including Medicaid/Uninsured) who are identified (or proclaim) to not have a primary care physician and/or patient centered medical home to address their post-acute care needs. Approximately 85% of the new patients seen in the program will be Medicaid/Uninsured. By having staff physically located in these locations, patients can receive real time assistance in finding a provider and ensuring they are connected with the appropriate resources they would require once discharged home. We will include staff coverage on the weekends as well to ensure that patients are able to be seen and connected to resources 7 days/week. Additionally, in order to close the loop, staff will follow-up with patients to make sure they have an appointment and that they attend their appointment. The staff will also be responsible for ensuring that other barriers such as transportation are addressed and patients are able to attend their follow-up visits. The Care Connect staff will receive e-mail notifications any time a patient revisits the hospital, at this time staff will proactively visit with the patient to ensure the patient is able to access their PCP/PCMH appointment and/or recommended community resource(s). Care plans will be developed for patients with high hospital utilization (especially patients with frequent emergency department visits) and complex needs. Care plans will include involvement with Social Work Supervisor, Hospital Medical Director and other hospital staff. Patients with care plans will be contacted as often as needed to ensure continuity of the care plan.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to connect a greater number of patients to a PCP/PCMH, 2) ensure the patients have the resources they need to care for themselves post discharge, 3) keep patients out of the ED and 4) create a care plan for high risk patients which ensures that the patient is receiving the follow-up care they need and are identified by staff when they readmit to the hospital

One of the major goals for the region is to reduce ED utilization and readmissions. This project focuses on and emphasizes both of these components. The entire impetus of the project is focused on Care Coordination and ensuring that patients are triaged to appropriate community and outpatient based resources. This is a strategy to decrease overall spending on health care in the region and help more patients connect to the essential primary care needed to maintain their health.

Challenges

Challenges with the underserved population almost always route back to the lack of continuity of care across the continuum. Because of their financial, time and resource constraints, this population often find a temporary fix to their health issue and once discharged from the hospital do not receive the care they need to stay healthy. If a patient is given an appointment

post discharge, they may have issues with transportation and other barriers that impede their access to care. Typically there is no follow-up to ensure the patient knows when their appointment is and if they actually went. This program aims to address these issues by identifying patients who do not have a PCP/PCMH, finding one for them, ensuring they have the resources they need to keep their appointment and then following up with the patient.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 7200 patients connected to a PCP, PCMH or community resource, 2) 35% of these patients will have confirmed appointments within 14 days post-discharge. We expect that there will be fewer ED visits and readmissions for this population that was connected through this program and will experience overall improved health outcomes due to receiving appropriate and adequate post-acute care.

Starting Point/Baseline

The baseline for this project at Baylor University Medical Center is 386 patients served by the program from July 2012 to August 2012. The purpose of this project is to expand the scope and coverage of this project for more patients. We anticipate that the targeted population for the entire region is approximately 260,000 patients. This is calculated by taking the average rate of patients who are uninsured that do not have a PCMH/PCP (30%) multiplied by the total number of uninsured in Dallas (36% of the population).[285]

Rationale

We selected this project because it is a low cost, highly effective way to help promote the continuity of care for the underserved population. Utilizing CHWs and social work as the main staff involved in this project, these individuals are connected to the community and understand their complex needs. This project helps patients that do not have a PCP/PCMH connect to one and then also offers the continuous improvement piece that is often missing in these types of initiatives. We have seen demonstrated results in some of our other Baylor facilities that have shown reduced readmissions and lower ED utilization and we want to implement at Baylor University Medical Center. The other attractive components are the multidisciplinary care plans that will be developed for the highest risk patients to identify these individuals and hone in on triggers that cause them to (re)admit. We believe that this intervention is an effective way for staff to be involved with the patient at a grassroots level and allow patients to feel that they have someone responsible for ongoing care and navigation needs.

Project Components

This project has multiple components from the protocol including:

a. Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency: *This is a core part of our*

[285] http://quickfacts.census.gov/qfd/states/48/48439.html

program, we will be focusing on all ED patients that are identified to not have a PCP/PCMH. Our Care Plans are developed for patients who are frequent ED utilizers as well. Lastly, our CHWs that we will hirie come directly from the communities they serve so they understand the challenges/issues with patients that come from that community.

b. Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.*This project will primarily use CHWs and Social Workers to navigate patients and manage care.*

c. Connect patients to primary and preventive care. *The impetus of this program is focused on connecting patients to PCP/PCMH*

d. Increase access to care management and/or chronic care management, including education in chronic disease self-management. *Through connecting patients to a Baylor Clinic PCMH, these services for chronic care management will also be addressed.*

e. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures

The milestones and metrics that we chose are directly related to two of the goals identified by the region: 1) need for more care coordination and 2) overuse of ED services. The metrics we have in place increase the number of the target population served over the Waiver period and emphasize the connection rate to a PCP/PCMH. In addition, we have added a metric that creates regular reports that show comparative analyses year over year of the program. We believe by running detailed reports on what services were provided and how these coincide with the needs of the community, will allow for maximum effectiveness and positive outcomes of the project. These metrics directly impact the health and well-being of the patients served and ensure continuity in their care.

Unique community need identification number the project addresses:

CN.12- ED Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative

This project does not receive any federal funds and is a new initiative. It is focused on reducing high cost utilization of the ED setting and connects patients with a PCP/PCMH to avoid subsequent ED visits. This is a low cost, highly effective way to keep patients in appropriate care settings to manage their needs.

Related Category 3 Outcome Measures

The Standalone and Non-standalone metrics come from 2 different domains because the true impact of this project is through ED appropriate utilization and cost savings. Both are priorities for the Region, which is why we felt we should show improvement in both areas.

Outcome Measure #1: IT-9.2 ED appropriate utilization (**Standalone measure**). According to the Community Health Needs Assessment of Region 9, 68% of the ED visits in the region were for non-emergent situations that could have been handled in the primary care/outpatient settings. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.[286]

Outcome Measure #2: IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (**Non- standalone measure).** Financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[287]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region. On a more global level, AHRQ found that the average cost in 2006 for an uninsured patient stay in the hospital cost about $19,400. There is definite room for opportunity to produce cost savings for this population.[288]

Relationship to other Projects

139485012.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

The navigation program is located in the hospital and will facilitate the connection of patients to the Baylor Clinic that are identified by the staff to not have a PCP/PCMH.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Care Coordination models require an initial connection but also require resources to triage patients to. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the Region's responsibility to ensure there are outlets for these patients to receive the care they need. Care Navigation programs serve the patients located in the specific EDs/inpatient units of the performing providers and thus do not duplicate patients on a per visit basis. While our geographies overlap, these programs are localized to individual hospitals. The 12 projects in RHP 9 to enhance patient navigation programs include the following:

Plan for Learning Collaborative.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 3 Regional Healthcare Partnerships. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project.

Baylor University Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. ***Baylor University Medical Center*** defined the population that will be directly impacted by the project as the underserved/uninsured patients that do not have a PCP/PCMH that present in our ***Baylor University Medical Center*** *ED or inpatient units.* We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is connected to community and primary care resources, they can find ways to manage their illnesses on a daily basis and have a contact for their care needs. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a *4.* We believe this to be the correct number because, when a person is positively impacted, their ED utilization decreases, community resource burdens are relieved and a greater number of people have a PCMH.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option 2.12.2 – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or defined patient population: Early follow-up such as homecare visits primary care outreach/patient call-backs - Vulnerable Patient Network (Home Visit Program)

RHP Project Identifier: 139485012.2.4 – Pass 2
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is a nationally recognized hospital that cares for more than 300,000 people each year. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will provide in-home visits to the highest risk uninsured and Medicaid patients. Risk is defined by patient propensity of complications, (re)admissions, downstream healthcare utilization and costs within the parameters of socioeconomic and clinical risk indicators. The team will be led by an APRN overseen by a Medical Director and augmented with a Social Worker, LVN and Care Coordinator who will have overall oversight and responsibility of continuity of care for the patients in the program. Services such as examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education will be available in the patient's home. This project is an expansion of the Vulnerable Patient Network at Baylor University Medical Center. New components include an expanded care team, risk stratification and identification of high risk patients, complete oversight and management of program patients and increased contact encounters with patients in their homes.

Need for the project: High risk and complex patients that need intensive management will receive care in their homes to address acute and chronic needs. This should facilitate fewer visits to the ED, greater compliance to clinical protocols and regimens and create improved quality outcomes.

Target population: The top 5% highest risk patients of the 872,000 uninsured and Medicaid population in Dallas County that have at least one of the following characteristics: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide care to 100 high risk patients.

Category 3 outcomes: Category 3 outcomes for this project focus on identifying and improving impediments to patient care in order to increase compliance and better outcomes.

- IT-10.1: Quality of Life. Our goal is to increase mean score (from time of enrollment to current survey) on QOL assessments by 7% by DY5 for patients in program for at least 6 months.

- IT-10.2: Activities of Daily Living. Our goal is to increase the mean score (from time of enrollment to current survey) on ADL assessments by 7% by DY5 for patients in the program for at least 6 months.

Project Description

The Vulnerable Patient Network (VPN) program provides home visits to the highest risk (clinically, economically and socially) and vulnerable Medicaid and uninsured patients. Using a combination of the Hot Spotting model developed by Dr. Jeffery Brenner of the Camden Coalition of Healthcare Providers[289] and a validated risk stratification tool, we will stratify and identify the top 5% of high risk patients in the Medicaid and Uninsured population. Qualifiers for enrollment in this program include patient characteristics that include but are not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or any other medical or social conditions limiting the patients' ability to access care in an ambulatory care setting. A multidisciplinary team comprised of an advanced nurse practitioner (APRN) and LVN to see patients in the home and provide acute, primary and chronic care. In addition, social workers will be part of the team to address barriers to care and any social issues. Care Coordinators will also be part of this team to facilitate coordination and continuity of care for patients and have high level oversight for patients; bringing together the necessary components of care for these complex patients. Lastly, a Medical Director will have management over the entire project. A full spectrum of services will be available in the patient home ranging from examinations and clinical decision making to changing urinary catheters, labs, vaccinations and medication reconciliation, management and education.

Goals and Relationship to Regional Goals

The goals for this project are: 1) Increase patients who receive primary care, 2) Overcome access issues for high risk patients, 3) Address acute care issues in the patient's home rather than the Emergency Department, 4) Increase patient compliance and adherence to regimens, 5) Decrease barriers to care around receiving medications and overall care, 6) Increase contact rate with provider for high risk patients and 7) Increase medication reconciliation frequency.

Two of the goals for the region include increasing healthcare capacity and decreasing ED utilization and readmissions. This project increases access to care for those high risk patients who are unable or unwilling to be seen in primary care office. It creates additional points of care for patients to receive care and improve compliance and clinical outcomes. Patients who have multiple chronic diseases and unable to go to appointments can have their conditions proactively managed in their homes. Together long term disease management and avoidance

[289] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011.

of exacerbations lead to better clinical outcomes, lower ED utilization, lower costs and better overall patient health. According to the Community Needs Assessment, the conditions with the highest ED visit volumes for the Medicaid and uninsured population were: diabetes, CHF and stroke. With proper and consistent management, these conditions are manageable.[290] The top 10 utilizers of health care services in the region accumulated $26 million in costs.[291] These patients would be candidates for this Home Visit program, identifying them through the "hot spotting" methodology[292] and proactively managing their conditions. This program will help to improve outcomes of chronic diseases and related complications by proactively managing the patient in a setting that is convenient and comfortable for them, hopefully increasing compliance to treatment protocols and medication adherence.

Challenges

High risk (clinical and socioeconomic) uninsured and underinsured patients often have multiple co-morbidities, issues with access and lack of resources to care for themselves. These patients, due to financial and other constraints cannot afford medications, transportation to appointments and may be physically incapable of leaving their homes to receive care. These are the patients that end up having their clinical conditions escalate and end up in the Emergency Department because the lack of adequate and timely primary care. This program would remove barriers to access by providing a full range of clinical and social services high risk patients need in their homes. This also allows the care team to physically survey the patient's living conditions and find inhibitors to help the patient overcome these issues to better care of themselves.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) provide home care to a minimum of 100 patients, 2) improve mean quality of life scores by a 7% over baseline for patients enrolled in VPN for at least 6 months, 3) improve Activities of Daily Living mean scores by 7% over baseline for patient enrolled in VPN for at least 6 months and create a robust, multidisciplinary care team that manages everything for the patient from scheduling appointments, receiving labs/medications to addressing social issues and helping the patient to overcome barriers to care. We expect that ED and inpatient utilization will decrease and this cohort of high risk patients will have improved clinical outcomes and fewer downstream disease complications/issues.

<u>Starting Point/Baseline</u>

The baseline for this project at Baylor University Medical Center has not been rigorously tracked. Approximately 90 patients have been seen over the past 2 years. On average, patients remain in the program for 298 days. Currently, the patient panel for the program includes Medicare patients who, under this project will be transitioned to a different service. Although this project is an extension of the current program Baylor University Medical Center has in

[290] RHP 9 Community Health Needs Assessment

[291] RHP 9 Community Health Needs Assessment.

[292] Gawande, A. "The hot spotters." *The New Yorker*, January 24, 2011

place, it has many new components (expanded care team, more services, greater frequency of visits, focus on Medicaid and Uninsured, etc).

Rationale

We selected this project because in the populations we serve, many times patients are unable or unwilling to come to the Baylor Clinic to receive the care they need. The Medicaid and uninsured populations have multiple social, economic and other barriers on top of clinical issues that prevent them from appropriately managing their health. This project uses a face to face mechanism whereby patients are monitored regularly and have all of their needs met in a venue that is convenient and comfortable for them. In a recent article in Health Affairs, entitled Six Features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients, Brown found supplementing telephone calls to patients with frequent in-person meetings; occasionally meeting in person with providers; acting as a communications hub for providers; delivering evidence-based education to patients; providing strong medication management; and providing timely and comprehensive transitional care after hospitalizations were characteristics of successful care coordination programs.[293] Our project, the Vulnerable Patient Network incorporates these components into the program and furthers them by adding additional services such examinations and clinical decision making to changing urinary catheters, labs, vaccinations. The team we propose to put in place would be able to address all of these needs in a coordinated and fluid fashion.

Project Components

This project has no required project components. We do plan to engage in continuous quality improvement activities such as: identifying project impacts, "lessons learned," opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations.

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on identifying and intervening on high risk patients who are high utilizers of healthcare services and are unable or unwilling to receive care in an ambulatory care setting. There is one point of clarification needed around the target population for this project. We define the target population as the following:

- Numerator: The number of patients enrolled in the program
- Denominator: The number of patients referred from the hospital as identified by Care Coordinators/Navigators as possible candidates based on identified risk factors including but not limited to: homebound, disabled, multiple chronic diseases, polypharmacy or

[293] Brown, RS. Six features of Medicare coordinated care demonstration programs that cut hospital admissions of high risk patients. *Health Aff*. 2012 June; 21(6): 1156-1165.

any other medical or social conditions limiting patients' ability to access care in ambulatory care setting

The reason we selected outcome measures related to Quality of Life and Activities of Daily living was in order to emphasize the importance for the Care Team to identify and assess non-clinical barriers that may be impeding the patient from receiving the optimal level of care necessary to maintain and sustain their health status.

Unique community need identification number the project addresses:
CN.3- Healthcare Capacity and CN.12 Emergency Department Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funds and is a new initiative. It is focused on addressing the complex needs of the highest risk patients by bringing care into their homes.

Related Category 3 Outcome Measures
The Category 3 Outcomes chosen for this project are based upon expected improvement for quality of life and activities of daily living. Many of the components included in Quality of Life and Activities of Daily living assessments help the care team to identify barriers to care and increase compliance. Both measures would also help to periodically and regularly assess QOL and ADL measures to keep an updated record of the patient's barriers to care.

Outcome Measure #1: IT-10.1 Quality of Life (**Standalone measure**).
Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[294] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure #2: IT-10.2 Activities of Daily Living (**Standalone measure**).
Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[295] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or

[294] Hawthorne, G. The assessment of quality of life instrument: a psychometric measure of health related quality of life. *Qual Life Res.*8(3):209-24 (1999)
[295] Measuring ADLs Across National Surveys: http://aspe.hhs.gov/daltcp/reports/meacmpes.htm

barriers that patients may be experiencing.[296] We may need to consider using the Lawton IADL scale for this population as it involves more complex activities such as: shopping, laundry, responsibility for own medications, etc.[297] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Relationship to other Projects

139485012.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
Patients that are in the Vulnerable Patient Network can come from the Baylor Clinic. Patients that are identified as high risk from the Baylor Clinic are candidates for the VPN program.

Project Option 2.11.3 – Other Project Option- Evidence Based Interventions that put in place teams, technology and processes to ensure medication compliance and management- Medication Management and Prescription Assistance Program

RHP Project Identifier: 139485012.2.5 – Pass 2
Performing Provider Name/TPI: Baylor University Medical Center/139485012

Provider: Baylor University Medical Center at Dallas (Baylor Dallas) is a nationally recognized hospital that cares for more than 300,000 people each year. Baylor Dallas has 1,065 licensed beds and serves as the flagship hospital of Baylor Health Care System. Located in Dallas, Baylor Dallas' service area represents a population of 4.2 million.

Intervention(s): This project will provide medication management and reconciliation services to uninsured and Medicaid patients at the Baylor Clinic on the Baylor University Medical Center campus. Patients who are 150% or below the FPL and/or have chronic illnesses can qualify for prescription assistance. A clinical pharmacist will be responsible for oversight of prescriptions, educate patients about how and why to take their medications and review utilization, appropriateness and efficacy of medications that patients have been prescribed. This project is a new initiative and contributes to creating a complete PCMH for underserved patients.

Need for the project: Non-compliance to medications can lead to complications and clinical exacerbations that are often avoidable with proper management and education. Medications are an important part of a patient's care regimen but can become an impediment to care when issues such as access or cost become prevalent. This project will help to overcome these issues.

Target population: Baylor Clinic patients who have multiple medications, chronic diseases and/or have demonstrated need for prescription assistance. At least 90% of patients served will be Uninsured/Medicaid.

Category 1 or 2 expected patient benefits: From DY3-DY5 the project will provide medication management to 480 patients.

Category 3 outcomes: Category 3 outcomes for this project do not have any baseline data and improvements are based on ranges of current performance.

- **IT-1.2** Annual monitoring for patients on persistent medications - ACE inhibitors or ARBs (Non-standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.4** Annual monitoring for patients on persistent medications– diuretic (Non-standalone measure). Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.

- **IT-1.5** Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)**.** Our goal is to increase the appropriate monitoring tests from at least 2% in DY3 to at least 6% in DY5.
- **IT-1.19** Antidepressant Medication Management - (Standalone measure). Our goal is to increase effective acute phase treatment by 5% in DY3 to 15% in DY5 and to increase continuous phase treatment by 3% in DY3 to 7% in DY5.

Project Description

This project option combines project options 2.11.1- Implement interventions that put in place teams, technology and processes to avoid medication errors and 2.11.2- Evidence based interventions that put in place the teams, technology and processes to avoid medication errors. The project option we chose combines the components of both of these project options but focuses on medication management and compliance in the ambulatory setting within the patient's Baylor Clinic PCMH. Based on current estimates by our providers, we anticipate that more than 50% of patients in the Baylor Clinic have five or more medications. Ensuring that these medications are 1) appropriate, 2) taken correctly, 3) managed and 4) accessible will be important to improve clinical outcomes. By combining two of the project options 2.11.1 and 2.11.2 to create an "other" option encompasses both a process for avoiding medication errors and evidence based interventions to avoid medication errors. We intend to utilize a clinical pharmacist who will review patient mediations for those patients who have multiple prescriptions on a regular basis to ensure that medications are appropriate and to ensure the patient understands how and why they are taking the medications. Additionally, we plan to help patients obtain the medications they need through implementing a prescription assistance program to help patients who are eligible, qualify for mediations and provide medications to those patients who cannot afford prescriptions. We will attempt to provide medications at little to no cost for patients who are 150% below the federal poverty level, have one or more chronic diseases and remain compliant with their appointments and care regimens. Through this benefit and clinical pharmacist oversight and management, we expect adherence and compliance to medications will increase. The additional advantage to embedding this team within the PCMH is that patients will receive comprehensive care management to address all of their needs in one care venue. The Baylor Clinic on the Baylor University Medical Center at Dallas tends to see more patients and more complex patients than similar clinics at Baylor Medical Center at Irving and Garland. The patients at Baylor University Medical Center present with more issues and on average can be more difficult to manage. The difference in valuation for this project versus the other facilities comes from 1) managing more patients and 2) managing more difficult polypharmacy patients.

Goals and Relationship to Regional Goals

The goals for this project are: 1) to provide prescriptions at little to no cost for patients that qualify or help patients enroll in programs to receive their medications, 2) provide clinical pharmacist oversight to ensure that medications are appropriate and adhered to, 3) patients understand their medications and reasons for taking them 4) improve clinical outcomes related

to adhering to a medication regimen. The regional goals around managing chronic disease, ED utilization and behavioral health are all addressed through this project. Managing medications has ancillary effects on outcomes of multiple regional goals. If patients have access to and adhere to their prescriptions, chronic diseases and behavioral health issues would be under better control and there would be fewer exacerbations and visits to the ED. This program is also a mechanism to improve cost savings for the region through monitoring utilization, finding generic prescriptions where appropriate and avoiding costly complications and expensive ED/inpatient utilization.

Challenges

Challenges with the underserved population and medication management pose one of the most difficult hurdles to overcome in their care. First, the uninsured and Medicaid populations are highly transient and may not maintain the same PCMH for an extended period of time. This causes gaps in their medication regimen and can often lead to clinical exacerbations. Another challenge is access to medications and affordability. Patients who do not live near a pharmacy to fill their prescriptions or cannot afford to fill them will forgo this part of their care or ration the medications they have, leading to complications and escalations in their conditions. One trend we have seen in RHP 9 is indigent patients will go from ED to ED across the region to receive pain medications and because there is little coordination between hospital systems, there is no consistent record of the medications these patients receive. Lastly, patients that are polypharmacy often do not understand how to take their mediations appropriately or understand why they need the prescription at all. This lack of understanding also leads to non-compliance. With this project, we plan to address these challenges by providing medications at little to no cost for those patients that qualify, help patients that are eligible get on prescription assistance programs, provide prescriptions in the Baylor Clinic or nearby on the Baylor campus and offer clinical pharmacist oversight to monitor the patients' prescriptions and encourage compliance to a medication regimen.

5-year Expected Outcome for Provider and Patients

The 5-year expected outcomes for this project include: 1) a minimum of 480 patients with medication management in a PCMH setting, 2) increased frequency of medication reconciliation and management, 3) greater literacy around medication regimens and purposes, 4) efficient and effective utilization of medications for patients and 5) make the clinical pharmacist part of the PCMH care team. We through proactive management of mediations for the uninsured and Medicaid populations that clinical outcomes will improve, there will be fewer exacerbations of patient diseases.

Starting Point/Baseline

Baylor clinics have not historically provided any type of formal medication management or prescription assistance type program to patients. This is a new program that will be offered. We anticipate that on average 5% of Baylor Clinic patients will need medication management services. Based on historical data, almost 50% of patients have five or more prescriptions. We anticipate that on average about 5-10% of high risk Baylor Clinic patients will need focused and

frequent medication management services. We will have to establish the baseline in DY2 for the particular medications mentioned in the Category 3 outcomes and to determine the scope of high risk and polypharmacy patients.

Rationale

We selected this project for multiple reasons: 1) to offer a complete suite of services to patients in a Baylor Clinic PCMH ranging from chronic disease and behavioral management, basic primary care, specialty care and medications, 2) provide regular medication management and reconciliation to ensure appropriate utilization and adherence to prescriptions, 3) improve clinical outcomes by enforcing a medication regimen with patients and 4) improve adherence to medications by offering assistance in obtaining them. Successful programs that focus on coordinating care for patients include a medication management component.[298] Our overall goal is to create a PCMH for uninsured and Medicaid patients that is comprehensive and has co-located services to allow for greater convenience and compliance for patients. The total economic impact of medication non-adherence — which contributes to costly health complications, worsening of disease progression, and preventable utilization — has been estimated to be as much as $290 billion.[299] For patients with diabetes, those with low levels of adherence have almost twice the total annual healthcare costs of those with high levels of adherence ($16,498 versus $8,886).[300] The New England Healthcare Institute cited four components to improving medication management: 1) creating health care teams, 2) patient engagement and education, 3) payment reform and 4) leveraging health information technology.[301] This project addresses all of these components by 1) integrating the clinical pharmacist into the PCMH team, 2) educating the patient on why and how to take their medications, 3) offering prescription assistance and little to no cost medications for those who qualify and 4) using the Baylor Clinic electronic health record to monitor prescription regimens, fulfillments and utilization. There have been studies published stating that giving patients medications for free does not promote utilization and adherence.[302] In a study published in the New England Journal of Medicine, insured patients who were discharged from the hospital and had their prescriptions fully covered still only had adherence rates of 40-50%.[303] We will control for this in two ways: 1) we will not offer prescriptions for free unless the patient is 150% or below the FPL and/or has at least 1 chronic disease and 2) we will require a patient is seen regularly in the Baylor Clinic to receive medications.

Project Components

We have chosen applicable components from project options 2.11.1 and 2.11.2 to create our project around medication management.

a. Develop criteria and identify targeted patient populations that are at high risk for developing complications, co-morbidities and/or utilizing emergency care services: *We will use our electronic health record to identify polypharmacy patients, patients who are on chronic disease medications and/or are high utilizers of the ED*

b. Develop tools to provide education and support to those patients at highest risk of an adverse drug event or medication error. *The clinical pharmacist we use for this program will help to educate the patient on these topics. We will ensure that materials are multilingual as well.*

c. Conduct root cause analysis of potential medication errors or adverse drug events and develop/implement processes to address those causes: *As one of our metrics, we will be designing the workflow for the clinical pharmacist and we will add this component into plan*

d. Implement pharmacist led chronic disease medication management services in collaboration with primary care and other healthcare providers: *The clinical pharmacist will be co-located in the Baylor Clinic and will interface with the PCMH team on a regular basis*

e. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *This project will be part of an overall Baylor initiative that will be analyzing and evaluating the progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.*

Reasons for selecting outcome measures

The milestones and metrics we chose for this project are focused on increasing the number of patients who receive medication management services and by having outcomes that specifically focus on medications, this will encourage the care team to manage and monitor medications more frequently and with higher scrutiny. Although medication management is part of the patient's overall care in a Baylor Clinic, these milestones, metrics and outcomes will put a greater emphasis on ensuring that mediations are appropriate, regularly reconciled, adhered to and are utilized in order to improve clinical outcomes for patients. The outcome measure medications that we chose: ACE/ARB inhibitors, diuretics, anticonvulsants and antidepressants are drugs that are regularly used by our Baylor Clinic patients. Since many of

our patients have hypertension and CHF, adherence improvement to these drugs will help to facilitate better outcomes.

Unique community need identification number the project addresses: CN.11 Patient Safety and Quality and CN.4 Primary Care and Pediatrics

How the project significantly enhances an existing delivery system reform initiative
This project does not receive any federal funds and is a new initiative. It is focused on providing prescriptions for patients in need and ensuring that utilization of these prescriptions is appropriate and (cost and clinically) effective.

Related Category 3 Outcome Measures
The Category 3 outcomes for this project focus on medication management and monitoring for specific drugs that many of our Baylor Clinic use. These medications are also associated with complex chronic diseases and behavioral health issues. These drugs are an important part of a patient's care regimen to keep their conditions well controlled.

Outcome Measure #1: IT-1.2 Annual monitoring for patients on persistent medications angiotensin
converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (Non- standalone measure). Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to antihypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[304] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure #2: IT-1.4 Annual monitoring for patients on persistent medications–diuretic (Non- standalone measure). Approximately 33% of Baylor Clinic patients are on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[305]

[304] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

[305] Chui, M. A., Deer, M., Bennett, S. J., Tu, W., Oury, S., Brater, D. C. and Murray, M. D. (2003), Association Between Adherence to Diuretic Therapy and Health Care Utilization in Patients with Heart Failure. Pharmacotherapy, 23: 326–332. doi: 10.1592/phco.23.3.326.32112

Outcome Measure #3: IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant (Non-standalone)**.** Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[306] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure #4: IT-1.19 Antidepressant Medication Management - (Standalone measure) Approximately 20% of Baylor Clinic patients are on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the region. The top 10 utilizers in the region had BH related issues.[307] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[308]" Our project supports this methodology.

Relationship to other Projects

139485012.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion
This medication management and prescription assistance program will be available to patients who are Baylor Clinic patients. The program will be incorporated into the overall care team and management of the patient.

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. The exchange of best practices and shared learning contributes significantly to CQI and will advance the success of this project.

Project Valuation

Baylor Health Care System spans over 2 RHPs. In order to be consistent in our valuation methodology, we have used the same process and technique across our hospitals to ensure consistency. Baylor Health Care System recognizes that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, we have priced our projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. That model computes separate values for impacts on the health care system, the individual and the community.

Baylor University Medical Center defined the population that will be directly impacted by the project as the underserved/uninsured patients that need prescription assistance and medication management services that are patients at a Baylor Clinic PCMH on the ***Baylor University Medical Center*** campus. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is on the correct prescription and on an appropriate medication regimen, they are better able to manage their illnesses and have better clinical outcomes. To determine the value to the community of each, we concluded that, on a scale of 1 – 5, the value of this project is a *3.* We believe this to be the correct number because, when a person is positively impacted, unnecessary drug utilization decreases, patients are able to become well and resume being active and productive members in society.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million dollars. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Option: 2.1.1 – Enhance/Expand Medical Homes

RHP Project Identifier: 138910807.2.1
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. There is one MyChildren's office in Grapevine (Region 10). Annually, Children's has approximately 600,000 patient contacts.

Provider's role in region's health care infrastructure (especially for Medicaid and indigent/uninsured): Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured).

MyChildren's payor mix is 75% Medicaid, 15% CHIP, 5% uninsured and 5% commercially insured.

Intervention: The purpose of this project is to transform the MyChildren's primary care offices into an NCQA-certified medical homes. It is a new initiative.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 4: Primary Care and Pediatrics, CN. 8 Chronic Disease, CN. 9 Specialty Care.

Target Population: Children in RHP 9 covered by Medicaid and CHIP who use MyChildren's as their primary care provider. Provide primary care and preventive care services to children in the medical home setting to allow for better coordination care, improved health outcomes and improved satisfaction for children and their families.

Intervention	DY3	DY4	DY5	Total
Patients in NCQA certified medical home MyChildren's offices	18,000	19,400	19,800	20,700*
Patient contacts in NCQA certified medical home MyChildren's offices	58,000	62,000	62,500	182,500

* 10% attrition and new patients, 95% total due to payor mix

Category 1 & 2 Expected Patient Benefit: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: OD-9 Preventive and Primary Care IT-9.2 ED appropriate utilization. (Stand-alone measure) Access to care delivered in a medical home environment should reduce both the use of the ED for inappropriate reasons as well as reduce overall use of the ED for patients receiving care in a medical home setting.

No additional federal grant dollars will be used for this project.

Project Description

- Develop, implement and spread across all Children's Medical Center (CMC) pediatric primary care centers, MyChildren's, a medical home team-based approach to care, transforming the existing fee-for-service delivery system from a reactive, fragmented approach to a proactive, comprehensive approach to improving the health of a population
- Expand staff roles to ensure that all staff are practicing at the top of their license; redesign processes in the CMC primary care centers to effectively use technology and staff to take responsibility for the health of a defined population and improve cost, quality, health and satisfaction outcomes
- Implement the effective use of IT systems, including patient identification, risk adjustment/analysis/scoring, predictive modeling, data warehousing, gaps in care alert system, provider profiling, outcomes measurement and reporting system capable of aggregating data at the individual patient level, chronic disease, pediatric physician panel, clinic and system-wide level
- Build, implement and spread a pediatric patient/family care coordination system across CMC primary care centers
- Build, implement and spread a health promotion and education program through the establishment of health resource centers

Goal and Relationship to Regional Goals

The goal of the project is to build infrastructure to expand the CMC primary care medical home capability and perform extensive innovation and redesign to achieve the outcome of NCQA Primary Care Medical Home recognition. This five-year project will involve capacity to manage chronic diseases, increase screening for potentially treatable and preventable conditions, and contribute to reduction in avoidable ED care and avoidable admissions/readmissions.

The expansion of a pediatric medical home approach complements and leverages the expansion of CMC's primary care centers such that the incremental primary care centers will be able to achieve a higher level of comprehensive, coordinated care and better quality, cost, health and satisfaction outcomes. By spreading the medical home model to all of our primary care centers to be able to empanel thousands of patients comprehensively and systematically, we can make a measureable difference in the experience, results and costs of health care.

Expanded prevention, wellness and patient/family education programs also feeds into the expansion of medical homes and more organized care delivery, better prevention and wellness programs specific to immunizations and well-child care, better prevention and management of chronic conditions, integrated physical-behavioral health care and better utilization of health care resources. Patients and families have better access to care, better access to behavior change programs, better access to social support networks and better access to health education. All of which is delivered in a patient/family-focused approach and in a culturally appropriate manner.

The medical home model increases opportunities to prevent disease and treat it early, where patients and families, upon patient discharge, can be scheduled for follow-up appointments at a medical home, thereby reducing the risk and consequences of worsening health conditions. Additionally, staff take responsibility for proactively reaching out to high risk patients, patients transitioning from one care setting to another and patients due to preventive services.

Challenges

A major challenge will be the thoughtful and careful redesign of care delivery and communications processes resulting in a team approach to patient/family centered care, requiring a formally structured, inclusive project management approach. This project will use proven process improvement methodologies to guide the redesign as well as use "lessons learned" from providers who have successfully redesigned care delivery in their practices.

Five-year Expected Outcome for Provider and Patients

Five-year expected outcomes include increased access to care, improved patient and family satisfaction, increased patient navigation and care coordination services for patients with chronic diseases, increased availability of information on healthy lifestyle choices and self-management through new community resource centers and decreased low complexity Emergency Department visits. The project is related to the regional goals of increased access to medical homes and improved patient and family satisfaction with services.

Starting Point/Baseline

Baseline measurements will be established using DY1 data.

Rationale

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the demand for both primary and specialty care services exceeds that of available physicians in these areas, thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Additionally, many individuals in North Texas suffer from chronic diseases that present earlier in life, are becoming more prevalent, and exhibit more severe complications. Finally, emergency departments are treating high volumes of patients with preventable conditions, or conditions

that are suitable to be addressed in a primary care setting. Additionally, re-admissions are higher than desired, particularly for those with severe chronic diseases or behavioral health.

Additionally, according to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the impact of the limited primary and specialty care is significantly profound for children and families in the region. With the current pediatric need being more than 80% of the current supply, in rural and urban areas the demand for primary care services is much higher than the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment. Additionally, data indicates that many of the pediatric specialists are limited, creating a backlogged pipeline for those needing specialty services after seeking primary care.

As we seek to develop pediatric medical homes through National Committee for Quality Assurance (NCQA) Patient Centered Medical Home (PCMH) recognition, MyChildren's will have the opportunity to provide better care through improved prevention screenings and routine primary and chronic care. The majority of the MyChildren's primary care providers are still functioning in a more traditional fee for service approach. We want to make sure the pediatric medical home model is embedded within the care delivery model at MyChildren's so that all patients can receive the right care in the right place at the right time. This is a strategic priority for MyChildren's because by providing more patients with family-centered, culturally appropriate coordinated care services grounded in their primary care medical homes, children can stay healthier and families can take better care of their children, thereby reducing avoidable ED visits, specialty visits, admissions and readmissions. Children will be identified via the IT support systems and then receive this care in a proactive, planned manner so that they can receive evidence-based interventions across the care continuum. The staff will be complemented to include nutritionists, social workers, community health workers and therapists as part of the family-focused patient care teams. Services will include group visits, care management, chronic care management, telephone outreach and home health care. Heavy emphasis will be placed on a patient/family-focused approach that incorporates evidence-based clinical protocols, and is applied in a consistent and documented manner. Rigorous measurement of both processes of care and pediatric outcomes will ensure continuous improvement and sustainability over time.

MyChildren's will utilize the IT support systems to track and monitor prevention and wellness programs, with targeted improvements in key quality indicators, such as well-child visits, immunizations and potentially preventable acute care services. Currently, primary care capacity, resources, infrastructure and technology are severely limited. Our goal is to better treat the volume of patients who need preventive and wellness interventions in addition to chronic care management. The IT support systems will promote tracking, trending timely intervention and support patient/family education through community-based resource centers.

The community resource centers will enable patients and families the opportunity to learn together, learn from each other, and achieve behavior change, which is sustainable to both prevent and better manage chronic illnesses. The community resource center's programs will be delivered by community leaders in a culturally appropriate manner. Referrals of identified patients and families will be made to community resource centers, where classes, group visits, training sessions, behavior modification programs, social networking and family counseling services will be provided to supplement the services provided in the primary care office.

Intervention	DY3	DY4	DY5	Total
Patients in NCQA certified medical home MyChildren's offices	18,000	19,400	19,800	20,700*
Patient contacts in NCQA certified medical home MyChildren's offices	58,000	62,000	62,500	182,500

* 10% attrition and new patients, 95% total due to payor mix

Project Components

All of the project components of 2.1 will be included in this project:

a. Utilize a gap analysis to assess and/or measure the primary care providers' readiness for National Committee for Quality Assurance (NCQA) Patient Centered Medical Home (PCMH) status
b. Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status
c. Conduct educational sessions for primary care physician offices, hospital board of directors, medical staff and senior leadership on PCMH elements, rationale and vision
d. Conduct quality improvement for the project using methods such as rapid cycle improvement

All milestones and metrics are based on the relevancy to RPH IX's population, community needs, RHP priorities and the starting point for the project.

Unique community need (CN) identification number the project addresses:

- CN. 4: Primary Care and Pediatrics
- CN. 8 Chronic Disease
- CN. 9 Specialty Care

How the project significantly enhances and existing delivery system reform initiative

This project represents a new initiative for Children's and its system of primary care providers: MyChildren's. Significant changes to practice, staffing, process and productivity will be reflected in the process of becoming qualified medical homes.

Related Category 3 Outcome Measures

OD-9 Right Care, Right Setting IT-9.2 ED appropriate utilization. (Stand-alone measure). This outcome measure was selected to track the reduction in inappropriate use of the Emergency Department by patients and families who receive their primary care in a medical home environment. The medical home environment is designed to provide a holistic approach to care which should include education and resources to select the correct level of care needed. Access to care delivered in a medical home environment should reduce both the use of the ED for inappropriate reasons as well as reduce overall use of the ED for patients receiving care in a medical home setting.

Relationship to other projects

Other related Children's Medical Center projects include:

138910807.1.1	Expand Primary Care Capacity
138910807.1.2	Expand Primary Care Hours
138910807.1.3	Implement Disease Management
138910807.1.4	Expand Pediatric Behavioral Health
138910807.2.2	Implement/Enhance Evidence-based Health Promotion Programs
138910807.2.3	Expand/Enhance Patient/Family Navigation
138910807.2.4	Implement/Expand Care Transitions Program

This project is related to the other Catgegory 1 and 2 projects proposed by children's because four of the other projects (Expand Primary care clinics and hours, Implement Disease Management and Expand Pediatric Behavioral Health) are all focused within the MyChildren's practices. The remaining three projects support overall population health and are supportive of this project to transform MyChildren's locations into NCQA certified medical homes.

Related Category 4 Population-focused Improvements

RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-6 Initial Core Set of Health Care Quality Indicators

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Related performing provider projects include:

Doctors Hospital at White Rock (Tenet):	094194002.2.1
Medical City Dallas Hospital:	020943901.2.4
Methodist Dallas Hospital:	135032405.2.3
Parkland Health & Hospital System:	127295703.2.1
Parkland Health & Hospital System:	127295703.2.11
Texas Health Presbyterian Hospital Dallas:	020908201.2.3

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. The exchange of best practices and shared learning contributes significantly to CQI and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	8	2.00
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	8	1.20
Sustainability	15%	9	1.35
Partnership Collaboration	5%	7	0.35
	100%		8.50

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into

adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Project Option: 2.6.1 - Implement Evidence-based Health Promotion Programs

RHP Project Identifier: 138910807.2.2
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Annually, Children's has approximately 600,000 patient contacts.

Provider's role in region's health care infrastructure: Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). Children's is considered the safety net hospital for pediatrics in region.

Intervention: The purpose of this project is to work with agencies and organizations in Dallas County through a formal steering committee to align and coordinate community-based prevention and wellness activities in the focused areas of asthma and diabetes to improve the health and self-management of children and their families. This is a new initiative for Children's.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 1: Community Overview and Description, CN. 2: Regional Healthcare Infrastructure and Patient Migration Patterns, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: The entire population of children, approximately 650,000 children, in Dallas County can be impacted by this initiative. The goal of the project is to organize, align and integrate the fragmented individual not-for-profit community health improvement activities into an organized and complimentary set of data-based and sustainable interventions focused on specific areas of need, such as asthma and diabetes. The outcomes are also patient and family-centered in that patients and families help identify the challenges of living with chronic illnesses and participate in designing interventions that are more relevant to the culture and lifestyles of the community and are therefore, more likely to be adopted and become self-sustaining. Initially the program will focus on children in Dallas County with asthma, approximately 65,000 children in DY2.

	DY3	DY4	DY5
Pediatric population Dallas County	650,000	657,000	670,000
Children with Asthma	65,000	65,700	67,000
70% Children with Asthma Medicaid, CHIP and	45,500	46,000	47,000

uninsured			

Category 1 & 2 Expected Patient Benefit: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: OD-9 Preventive and Primary Care. ~~IT 9.2 ED appropriate utilization~~ IT-9.3 Pediatric and Young Adult Asthma Emergency Department Visits (Stand-alone measure). This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children by coordinating and organizing community-based health improvement and disease prevention activities targeted for children and their families and implement evidence-based interventions through these activities to support overall health improvement in general and reduction of ED visits specifically.

The project will not use additional federal grant dollars.

Project Description

We propose to improve the quality of life for children with chronic illness, prevent illness and compress parents' time from work and absenteeism by advancing a collective impact health model to effectively engage children, their families and communities in self-management and lifestyle behaviors that enhance health. This initiative is called the Health and Wellness Alliance for Children. We will work with community agencies and organizations through a formal steering committee and individual work groups to align and coordinate community-based prevention and wellness activities in the focused areas of asthma and diabetes to improve health and self-management skills of children and their families. We will use a variety of strategies to improve the health of children in Dallas County including programs to promote healthy lifestyles using evidence-based methodologies including social media and text messaging in children, youth and their families. We will establish self-management programs and wellness programs using evidence-based designs. We will engage community health workers, both promotores and Grand Aides, in an evidence-based program to increase health literacy in children, youth and their families.

The collective impact process is designed to organize, align and integrate the fragmented individual not-for-profit community health improvement activities into an organized and complimentary set of data-based and sustainable interventions focused on specific areas of focus, such as asthma and diabetes. The outcomes of a collective impact process is also patient and family-centered in that patients and families help identify the challenges of living with chronic illnesses and participate in designing interventions that are more relevant to the culture and lifestyles of the community and are therefore, more likely to be adopted and become self-sustaining.

The Health and Wellness Alliance will organize a community-based stakeholder steering committee, including patient families, health care organizations, the health department, United

Way, Dallas Independent School District, business leaders, non-prfoits and elected officials. The steering committee will appoint work groups whose responsibility is to rigorously design, implement and measure outcomes of focused community-based interventions to improve the health of populations with chronic illness through behavior change and self-management strategies. To achieve sustainability, the Health and Wellness Alliance will build a small infrastructure to coordinate and measure the impact of the interventions as well as generate ongoing financial support through philanthropy and grant submissions.

A major initiative of the Health and Wellness Alliance will be to organize and establish a "virtual safety net" of primary care for the underserved, thus linking all the health care providers through information exchange, evidence-based treatment protocols and collective solutions to challenges such as access to after-hours care and access to specialty services.

Goals and Relationship to Regional Goals

The goals of the project are to increase healthy lifestyle behaviors, engage the community in developing self-management skills, to improve health literacy, reduce unnecessary ED utilization, reduce potentially preventable admissions, reduce 30-day readmissions and reduce potentially preventable complications. This project is related to the regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

Challenges

The challenges of this project will include gaining community engagement, coordinating large-scale interventions and maintaining sensitivity to cultural norms. The challenges will be addressed through the organization of this project, engagement of community leaders, reliance on evidence-based methodologies, and using quality improvement strategies to assess and intervene during the project. Project challenges will also be addressed using CQI techniques described in this narrative.

5-year Expected Outcome for Provider and Patients

Appropriate utilization of ED services and improve the health of low-income children.

Starting point/baseline
Baseline numbers will be established during DY2.

Rationale

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the demand for both primary and specialty care services exceeds that of available medical physicians in those areas; thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Additionally, many individuals in North Texas suffer from chronic diseases that present earlier in life, are becoming more prevalent, and exhibit more severe complications. Finally, emergency departments are treating high volumes of patients with preventable conditions, or conditions that are suitable to be addressed in a primary care setting. Additionally, re-admissions are higher than desired, particularly for those with severe chronic diseases or behavioral health conditions.

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the impact of the limited primary and specialty care is significantly profound for children and families in the region. With the current pediatric need being more than 80% of the current supply, in rural and urban areas the demand for primary care services is much higher than the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment. Additionally, data indicates that many of the pediatric specialists are limited, creating a backlogged pipeline for those needing specialty services after seeking primary care.

Children's Medical Center is the safety net hospital for children in Dallas County, providing the majority of emergency department, specialty and inpatient care to Medicaid and safety net patients/families. Providing community support to address the causes and exacerbation of asthma and diabetes will have a positive impact on the health of the children of Dallas County and reduce the overall cost of care and it will strengthen community engagement in healthy lifestyle behaviors. Initially the program will focus on children in Dallas County with asthma, approximately 65,000 children.

Project Components

- Conduct quality improvement for the project

This project will employ the Collective Impact model to support Continuous Quality Improvement (CQI). This model is based on research reported in the Stanford Social Innovation Review (Kania J and Kramer M, Winter 2011). The research identified five conditions common in successful large-scale efforts for social change: common agenda, shared management systems, mutually reinforcing activities, continuous communication and a backbone support organization. The backbone support organization, The Health and Wellness Alliance for Children, will be developed with the tools and infrastructure based on backbone organizations of large-scale, successful social change projects. The staff in the Alliance will plan, manage and

support the initiatives of the projects. The staff will provide the tools and support for Continuous Quality Improvement among the members of the Alliance. Tools will include but not be limited to proven improvement tools such rapid cycle improvement, LEAN and Six Sigma concepts.

Unique community need (CN) identification number the project addresses:

CN.1: Community Overview and Description
CN.2: Regional Healthcare Infrastructure and Patient Migration Patterns
CN.4: Primary Care and Pediatrics, CN 8: Chronic Disease
CN.9: Specialty Care
CN.12 Emergency Department Usage and Readmissions

How the Project significantly enhances an existing delivery system reform initiative

This project represents a new initiative for Children's Medical Center. This project is data driven and addresses areas of poor performance (overuse of ED services and inpatient services) and a disparity group ('safety net' children).

The milestones and metrics for this project are based on the relevancy to the RHP IX's population, the community needs, RHP priority (this project was rated the second highest priority level by the participating providers in the RHP), and the current state (starting point).

Related Category 3 Outcome Measures

OD-9 Preventive and Primary Care. IT-9.3 Pediatric and Young Adult Asthma Emergency Department Visits (Stand-alone measure)
This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children with asthma by coordinating and organizing community-based health improvement and disease prevention activities targeted for children and their families and implement evidence-based interventions through these activities to support overall health improvement in general and management of asthma specifically.

Relationship to Other Projects

Other Children's Medical Center projects include:

138910807.1.1 Expand pediatric primary care capacity
130910807.1.2 Expand pediatric primary care capacity
138910807.1.3 Implement and utilize pediatric-specific disease management system
138910807.1.4 Expand pediatric behavioral health capacity

138910807.2.1 Enhance/Expand pediatric medical homes
1389108072.3 Implement/expand patient navigation program
138910807.2.4 Implement/expand care transitions program

This project supports the work of the other projects which focus around care delivery on an individual basis by providing a framework for supporting community-based programs which focus on health promotion on a population and community focused basis.

Related Category 4 Population-focused improvements

RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-6 Initial Core Set of Health Care Quality Indicators

These indicators of population-focused improvement should improve as coordinated efforts to improve health on a population basis are implemented.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

There are no related health promotion projects in RHP 9

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	9	2.25
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	7	1.05
Sustainability	15%	7	1.05
Partnership Collaboration	5%	9	0.45
	100%		8.40

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness

	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program

RHP Project Identifier: 138910807.2.3
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Annually, Children's has approximately 600,000 patient contacts.

Provider's role in region's health care infrastructure: Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). Children's is considered the safety net hospital for pediatrics in region.

Intervention: We propose to develop and utilize a high-intensity, culturally appropriate care management system for Medicaid and safety net children and families, most of whom utilize Children's Medical Center's ED, specialty clinics and inpatient hospital as a safety net provider for children.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: The target population is children who inappropriately use the emergency department or other high-intensity services, approximately 44,000 unique patients. Children's Medical Center is the safety net hospital for children in Dallas County, providing the majority of ED, specialty and inpatient care to Medicaid and safety net patients/families. Identification of at-risk patients/families, development/implementation of care management plans across the continuum of care, effective and culturally appropriate patient/family education, communication with the patient's primary care physician, and tracking/follow-up of patients across the care continuum will ensure a closed-loop program for Medicaid and safety net children and families.

	DY3	DY4	DY5
Unique patients requiring navigation	42,600	43,000	44,000
Approximately 90% Medicaid, CHIP or uninsured	38,500	39,000	40,000

Category 1 & 2 Expected Patient Benefit: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization (Stand-alone measure). This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children.
This project is not supported by other Federal grants.

Project Description

We propose to develop and utilize a high-intensity, culturally appropriate care management system for Medicaid and safety net children and families, most of whom utilize Children's Medical Center's ED, specialty clinics and inpatient hospital as a safety net provider for children:

- Creation of an IT-support system to identify, register, risk-adjust and track children across a continuum of care. Children will be registered in the system by virtue of a trigger event at CMC, and assessed from a medical and social risk perspective
- Creation of culturally appropriate materials and processes for educating patients and their families
- Creation of intensive case management plans for the high risk situations involving patient navigators, case managers, specialty physicians, primary care physicians, home care, managed care plan, pharmacist and social worker; communication of plan to all involved providers, with team conferences, as necessary, organized by case management program
- Utilization of a tracking and follow-up system to provide comprehensive oversight of high risk patients/families
- Increase centralized staffing, as well as distributed ED, specialty clinic and hospital staffing, to support the overall program
- Utilize 24/7 clinical call center and outreach system using multiple modalities to connect with and message patients/families
- Utilize community resource centers to educate/train patients and families in group settings to self-manage clinical conditions, adopt new health and medical behaviors, use social networking to support behavior change and provide very specific education programs using community resources.

Children's Medical Center (CMC) will develop and utilize a high-intensity, culturally appropriate case management system for children and families who utilize or are referred to CMC facilities and services. The high intensity case management system will follow patients and families across the continuum of care, both within CMC and throughout the community and home settings.

Goals and Relationship to Regional Goals

Optimization of care coordination and delivery will improve access, reduce costs, improve linkages with primary care providers, reduce avoidable ED utilization and hospitalizations,

improve access to chronic care management and improve education of providers and caregivers in effective care management.

This project is related to the regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

Challenges

A major challenge will be the installation and implementation of the IT support system to enable the ability to integrate all providers for a patient/family, to respond in a timely manner and to identify high risk individuals out of a total population for intensive, timely follow-up. A well-defined and structured implementation plan will be important to meeting this challenge.

5-year Expected Outcomes for Provider and Patients

Five-year expected outcomes include reduction in low complexity ED visits, reduction in potentially avoidable admissions, reduction in potentially avoidable readmissions, reduction in potentially avoidable complications, increase in adherence to self-care plans and increase use of primary and preventive services

Starting Point/Baseline:

Baseline numbers will be established during DY2.

Rationale

Implementation of this project is expected to improve identification of high risk patients, create comprehensive care management plans across various community-based providers, educate patients/families, track and follow up patient trajectories and thereby reduces avoidable ED visits, reduce avoidable specialty clinic visits, reduce avoidable admissions and readmissions, and improve family self-management and health of children.

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the demand for both primary and specialty care services exceeds that of available medical physicians in those areas; thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Additionally, many individuals in North Texas suffer from chronic diseases that present earlier in life, are becoming more prevalent, and exhibit more severe complications. Finally, emergency departments are treating high volumes of patients with preventable conditions, or conditions that are suitable to be addressed in a primary care setting. Additionally, re-admissions are higher than desired, particularly for those with severe chronic diseases or behavioral health.

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, the impact of the limited primary and specialty care is significantly profound for children and families in the region. With the current pediatric need being more than 80% of the current supply, in rural and urban areas the demand for primary care services is much higher than the current supply. In Dallas County alone, over 36.2% of children were enrolled in Medicaid in 2010, exacerbating the issue of availability of primary care access and treatment. Additionally, data indicates that many of the pediatric specialists are limited, creating a backlogged pipeline for those needing specialty services after seeking primary care.

Medicaid and safety net patients have avoidable emergency department (ED) visits, specialty visits and hospitalizations for the exacerbation of acute and chronic conditions due to the lack of intensive case management, care navigation and care transitions that follow patients and families across the care continuum. Patients and families who do not have established, culturally appropriate systems and pathways of access for management or worsening of symptoms, or the transition from one care setting to another, often turn to emergency departments. Primary or specialty providers, who do not have access to a high intensity case management system, often utilize the most expensive services by referring patients to this care. Additionally, providers often do not understand the importance of care navigation and care transition support. Frequently, patients and families leave the ED, a specialty clinic or a hospital not understanding what was done to them when they were treated and how to care for themselves once released. This lack of knowledge frequently causes patients to be seen again in the ED or readmitted, causing needless suffering and preventable health care costs. Patients with complex social and medical problems, who represent a significant portion of patients in safety net EDs or hospitals, are at particularly high risk for readmission and poor health status. Children's Medical Center is the safety net hospital for children in Dallas County, providing the majority of ED, specialty and inpatient care to Medicaid and safety net patients/families. Identification of at-risk patients/families, development/implementation of care management plans across the continuum of care, effective and culturally appropriate patient/family education, communication with the patient's primary care physician, and tracking/follow-up of patients across the care continuum will ensure a closed-loop program for Medicaid and safety net children and families. The project will reach approximately 44,000 unique patients.

Project Components

Components of this project include:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Health care navigators will be trained in cultural competency as well as come from culturally diverse backgrounds.
b) Deploy innovative health care personnel as patient navigators.
c) Connect patients to primary and preventive care.

d) Increase access to care management and/or chronic care management including education in chronic disease management.
e) Conduct quality improvement for this project using methods such as rapid cycle improvement.

All project components were selected because they will assist in the successful implementation of the project.

Unique community need (CN) identification number the project addresses:

CN 3: Healthcare capacity
CN 4: Primary Care and Pediatrics
CN 8: Chronic Disease
CN 9: Specialty Care
CN 12: Emergency Department Usage and Readmissions

How the Project significantly enhances and existing delivery system reform initiative

This project represents a new initiative for Children's Medical Center. This project is data driven and addresses areas of poor performance (overuse of ED services and inpatient services) and a disparity group ('safety net' children).

Related Category 3 Outcome Measures

OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization (Stand-alone measure) This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children. This project will target specific intervention for families who routinely use the Emergency Department for low complexity and primary care. By providing education and assistance in securing a medical home, these families' use of the Emergency Department should decrease.

Reasons/Rationale for selecting outcome measures
The project is designed to support appropriate utilization of ED services and improve the health of low-income children.

Relationship to other projects
Other related Children's Medical Center projects include:

138910807.1.1 Expand pediatric primary care capacity
138910807.1.2 Expand pediatric primary care hours
138910807.1.3 Implement and utilize pediatric-specific disease management system
138910807.1.4 Expand pediatric behavioral health capacity
138910807.2.1 Enhance/Expand pediatric medical homes

138910807.2.2 Implement Evidence-based Health Promotions Program
138910807.2.4 Implement/expand care transitions program

This project will support care delivery being developed to navigate patients into primary care medical home settings as well as assist pediatric patients as they transition to adult providers.

Related Category 4 Population-focused improvements:

RD-1: Potentially Preventable Admissions (PPA)

Relationship to Other Performing Providers' Projects in the RHP

The RHP 9 projects to enhance patient navigation programs include the following:

Performing Provider	Unique Project

Learning Collaborative. We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	8	2.00
Alignment with Community Needs	20%	8	1.60
Cost Avoidance	15%	8	1.20

Sustainability	15%	9	1.35
Partnership Collaboration	5%	7	0.35
	100%		8.30

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

The project will not use additional federal grant dollars.

Milestone 1 (P-1): Conduct a needs assessment to identify the patient population(s) to be targeted with the Patient Navigator program. P-1.1. Metric: Provide report identifying the following: a. Targeted patient population characteristics (e.g., patients with no PCP or medical home, frequent ED utilization, homelessness, insurance status, low health literacy). b. Gaps in services and service needs. c. How program will identify, triage and manage target population (i.e. Policies and procedures, referral and navigation protocols/algorithms, service maps or flowcharts). d. Ideal number of patients targeted for enrollment in the patient navigation program e. Number of Patient Navigators needed to be hired f. Available site, state, county and clinical data including flow patients, cases in a given year by race and ethnicity, number of cases lost to follow-up that required medical treatment, percentage of monolingual patients h. Data Source: Program documentation, EHR, claims, needs	Milestone 3 (P-2): Establish/expand a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigator education. P-2.3. Metric: Frequency of contact with care navigators for high risk patients. a. Numerator: Number of care navigation encounters b. Denominator: Number of unique patients enrolled in patient navigation program. c. Data Source: Patient navigation program materials and database, EHR d. Rationale/Evidence: Patient care navigation has been established as a best practice to improve the care of populations at high risk of being disconnected from health care institutions e. Goal: Average of 2 contacts per patient in navigation program 30,000 unique patients by 9/30/2014 Milestone 3 P2 Estimated Incentive Payment (maximum amount): $1,150,853	Milestone 6 (P-5): Provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. The navigation program is accountable for making PCP or medical home appointments and ensuring continuity of care. Especially for disenfranchised or medically complex patients, navigation is about guiding people through and across the healthcare system, from provider to provider, ensuring they can get to and make multiple appointments, get prescriptions filled, access to community services for people with special needs, etc. the patient navigator represents the liaison between primary, secondary, tertiary and quaternary health care. P-5.1. Metric: Collect and report on all the types of patient navigator services provided. a. Data Source: electronic Health Record b. Rationale/Evidence: Patient Navigators are intended to help patients and their caregivers interact with various departments and processes within the health care system. Developing a report of the	Milestone 8 (I-6): Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services. I-6.1. Metric: Increase medical home empanelment of patients referred from navigator program. a. Numerator: Number of new patients referred for services from Patient Navigator Program that are seen in primary care setting and empanelled to the medical home. b. Denominator: Number of new patients referred for services from Patient Navigator Program. c. Data Source: Performing Provider administrative data on patient encounters and scheduling records from patient navigator program. d. Rationale: Patient care navigation has been established as a best practice to improve the care of populations at high risk of being disconnected from health care institutions. Tying inpatient and outpatient care can help integrate inpatient and outpatient services and promote accountability for the coordination, cost and quality of care.

Project Option 2.12.2 - Implement/Expand Care Transitions Programs

RHP Project Identifier: 138910807.2.4
Performing Provider Name/TPI: Children's Medical Center/138910807

Provider: Children's has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children's has pediatric specialty outpatient services in Dallas, Plano and Grapevine. Children's also has a system of primary care centers, MyChildren's, which focuses on providing primary care to children covered by Medicaid and CHIP. Annually, Children's has approximately 600,000 patient contacts.

Provider's role in region's health care infrastructure: Children's has the largest market share for pediatrics in DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). Children's is considered the safety net hospital for pediatrics in region.

Intervention: A standardized approach to transitioning an adolescent with special health care needs or at risk for loss of medical services will be developed and applied to multiple medical and social conditions of the patient and family. The plan will be customizable as needed but contain a standardized approach to the transition process.

Need for the Project: The need for this project is documented in the community needs (CN) assessment, specifically: CN. 2 Regional Healthcare Infrastructure and Patient Migration Patterns, CN. 3 Healthcare capacity, CN. 4: Primary Care and Pediatrics, CN 8: Chronic Disease, CN. 9: Specialty Care and CN. 12 Emergency Department Usage and Readmissions.

Target Population: The target population is children with special health care needs aging out of the pediatric system needing to transition to adult providers. There are approximately 3,000 patients annually. The transition process will begin at age 14 so that approximately 16,000 patients are in the project in DY3.

	DY3	DY4	DY5
Patients in transition program	16,000	17,000	17,500
Approximately 65% Medicaid, CHIP, uninsured	10,700	11,000	11,300

What is the project's benefit for Medicaid and Uninsured of your Service area? Children's Medical Center is the safety net hospital for children in Dallas County, providing the majority of ED, specialty and inpatient care to Medicaid and safety net patients/families. Identification of at-risk patients/families, development/implementation of care management plans across the continuum of care, effective and culturally appropriate patient/family education, communication with the patient's primary care physician, and tracking/follow-up of patients

across the care continuum will ensure a closed-loop program for Medicaid and safety net children and families.

Category 1 & 2 Expected Benefit: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 Outcome: OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization (Stand-alone measure). This measure was selected because the project is designed to support appropriate utilization of ED services. Historically, these patients have continued to use Children's ED services after they have aged out pediatric care.
This project is not supported by other federal grants.

Project Option 2.12.2 - Implement/Expand Care Transitions Programs
Project Description
A standardized approach to transitioning an adolescent with special health care needs or at risk for loss of medical services will be developed and applied to multiple medical and social conditions of the patient and family. The plan will be customizable as needed but contain a standardized approach to the transition process. Children's Medical Center and Texas Scottish Rite Hospital for Children will develop and implement a planned healthcare transition program for children with chronic medical conditions or who are at risk for loss of medical services as they transition from adolescence to adulthood. The process will begin at age 14 with additional training and activities each year until the patient turns 18 and is either transitioned to adult providers or determined to stay with their pediatric specialists (such as late stage muscular dystrophy patients, cancer patients in active treatment). Total number of patients in the transition program in a year (ages 14 through 18) is 16,000 patients.

Goals and Relationship to Regional Goals

The goals of this project are to establish a process to systematically address learning needs as children approach adulthood with chronic illness and to establish strong linkages to adult providers so that young adults do not experience a break in the continuity of care as they transition from pediatric providers to adult providers as they age out of pediatric care. This project is related to the regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

Challenges

There are challenges to implementing this project. There are limited number of adult providers who can manage adults with childhood chronic disease as well as limited number of primary care providers. Some adults with complex chronic conditions acquired in childhood will require assistance from a third party to make decisions for them. By providing a standardized approach to transitioning adolescents

into adult programs, establishing referral relationships with adult providers and partnering with the RHP's adult providers who are expanding access to health care through the development of My Medical Home, the impact of these challenges will be significantly reduced.

5-year Expected Outcomes for Provider and Patients

Five-year expected outcomes include reduction in low complexity ED visits, reduction in potentially avoidable admissions, reduction in potentially avoidable readmissions, reduction in potentially avoidable complications, increase in adherence to self-care plans and increase use of primary and preventive services.

Starting Point/Baseline

Baseline numbers will be established in DY2.

Rationale

According to Regional Health Partnership IX Community Needs Assessment Report, Dallas Fort Worth Hospital Council, April 2012, many individuals in North Texas suffer from chronic diseases that present earlier in life, including many children who suffer from chronic diseases that are becoming more prevalent and exhibit more severe complications. In 2002, a consensus statement coauthored by the American Academy of Pediatrics, the American Academy of Family Physicians and the American College of Physicians-American Society of Internal Medicine emphasized the importance of active engagement in the transition of adolescents with special health care needs into adulthood. A follow-up report in 2011 stated that wide-spread implementation of health transition programs has not occurred.

When a patient's transition is less than optimal, the repercussions can be serious: avoidable hospital admission, unnecessary emergency department visits, escalation of severity of the condition and development of additional co-morbidities. Adult primary care providers are challenged in providing care to young adults who have not been prepared to be their own health advocate and who do not understand their own medical history and conditions. The 2007 AAP Annual Leadership Forum developed a resolution stating "transitioning youth with special health care needs to adult health care" as a top-10 priority. Providing support to transition adolescents with special health care needs and/or those at risk for loss of medical services is imperative in the development of a comprehensive continuum of care of which promotes health and appropriate management of chronic conditions. The transition program will increase opportunities to prevent disease and minimize unnecessary exacerbation of chronic illness.

Project Components

There are no core components for Project 2.12.2. The milestone and metrics for this project are based on the relevancy to the RHP 9's population, the community needs, RHP priority (this project was rated the second highest priority level by the participating providers in the RHP), and the current state (starting point).

Unique community need (CN) identification number the project addresses:

CN.2 Regional Healthcare Infrastructure and Patient Migration Patterns
CN.3 Healthcare Capacity
CN.4 Primary Care and Pediatrics
CN.8 Chronic Disease
CN.9 Specialty Care
CN.12 Emergency Department Usage and Readmissions

How the project significantly enhances and existing delivery system reform initiative

This project represents a new initiative for Children's Medical Center. This project is data driven and addresses areas of poor performance (overuse of ED services and inpatient services) and a disparity group (Children with chronic medical conditions aging out of pediatric care services).

Related Category 3 Outcome Measures

OD-9 Right Care, Right Setting
IT-9.2 ED appropriate utilization (Stand-alone measure)

This measure was selected because the project is designed to provide a transition to adult care and reduce inappropriate utilization of ED services. Currently, former pediatric patients who do not successfully transition to adult providers return to Children's Emergency Department for care. In 2012, there were 38 patients between the ages of 18 and 19 who used Children's Emergency Department 157 times, averaging 4.13 visits per patient. By providing a better transition plan for these patients, this number of inappropriate visits should decrease for this patient population.

Relationship to other projects

Other Children's Medical Center projects include:

139810807.1.1	Expand Primary Care Capacity
138910807.1.2	Expand Primary Care Hours
138910807.1.3	Implement Disease Management
138910807.1.4	Expand Pediatric Behavioral Health
138910807.2.1	Expand Medical Homes
138910807.2.2	Implement/Enhance Evidence-based Health Promotion Programs
138910807.2.3	Expand/Enhance Patient/Family Navigation

The projects listed above, when fully implemented, will assist in identifying patients aging out of pediatric care who need assistance in transitioning to adult providers.

Related Category 4 Population-focused improvements

RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-6 Initial Core Set of Health Care Quality Indicators

As appropriate care transition occurs, overall population health metrics should improve.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative
Other performig provider related projects inclue:

Performing Provider	Unique Project Number
Baylor Medical Center at Garland	121790303.2.4
Baylor Medical Center at Irving	121776204.2.4
Children's Medical Center	138910807.2.4
Doctors Hospital at White Rock (Tenet)	094194002.2.2
Parkland Health & Hospital System	127295703.2.9
University of Texas Southwestern – Faculty	126686802.2.5
University of Texas Southwestern – Hospital	175287501.2.3

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation
This project was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	7	1.40
Population Served / Project Size	25%	5	1.25
Alignment with Community Needs	20%	6	1.20
Cost Avoidance	15%	6	0.90
Sustainability	15%	8	1.20

Partnership Collaboration	5%	9	0.45
	100%		6.40

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact
Moderate Weakness: Lessens impact
Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.

This project is not supported by other federal grants.

Year 2 (10/1/2012 – 9/30/2013)	**Year 3 (10/1/2013 – 9/30/2014)**	**Year 4 (10/1/2014 – 9/30/2015)**	**Year 5 (10/1/2015 – 9/30/2016)**
Milestone 1 (P-4): Conduct an assessment and establish linkages with community-based organizations to create a support network for targeted patients post-discharge P-4.1. Metric: Care transitions assessment a. Submission of care transitions assessment and resource planning documents b. Data Source: Care transitions assessment and resource planning documents c. Rationale/Evidence: It is important to try to coordinate care with facilities outside a provider's own delivery system so that patients going in and out of the delivery system can receive optimal care, wherever possible. The Community Based Care Transitions Program is an example of this innovative work. d. Goal: Needs assessment completed 9/30/13 Milestone 1: P.4 Estimated Incentive Payment *(maximum amount):* $1,296,819 Milestone 2 (P-7): Develop a staffing and implementation plan to	Milestone 3 (P-1): Develop or implement best practices or evidence-based protocols (such as Partnership for Patients) for effectively communicating with patients and families during and post-discharge to improve adherence to discharge and follow-up care instructions P-1.1. Metric: Care transitions protocols a. Submission of protocols b. Data Source: Submission of protocols, Care transitions program materials c. Rationale/Evidence: Protocols for discharge planning and post discharge follow-up will allow for wider and more affective system adoption of new practices. d. Goal: Develop protocols by 9/30/14 Milestone 3 P1 Estimated Incentive Payment *(maximum amount):* $1,326,337 Milestone 4 (P-2): Implement standardized care transition processes P-2.1. Metric: Care transitions policies	Milestone 5 (I-10): Identify the top chronic conditions (e.g., heart attack, heart failure and pneumonia) and other patient characteristics (e.g., medical home assignment and demographics such as age) or socioeconomic factors (e.g., homelessness) that are common causes of avoidable readmissions I-10.1. Metric: Identification and report of those conditions, socioeconomic factors, or other patient characteristics resulting in highest rates of re-admissions. a. List by frequency of most prevalent chronic conditions, patient factor or other socioeconomic factors in patient panel resulting in highest readmission rates. b. Data Source: Registry or EHR report/analysis c. Rationale/Evidence: Assessing the most prevalent conditions and factors that lead to re-admissions will allow the provider to address the needs of the patient population more effectively. d. Goal: Top chronic conditions identified by 9/30/15	Milestone 7 (I-14): Implement standard care transition processes in specified patient populations. I-14.1. Metric: Measure adherence to processes. a. Numerator: Number of patients in defined population receiving care according to standard protocol. b. Denominator: Number of population patients discharged. c. Data Source: Hospital administrative data and the patient medical record. **d.** Goal: 50% of identified patients receiving care according to standard protocol. 5,650 unique patients Milestone 6: I-14 Estimated Incentive Payment *(maximum)* $2,138,590

Denominator: Number of population patients discharged. c. Data Source: Hospital administrative data and the patient medical record. **d.** Goal: 25% of identified patients receiving care according to standard protocol. 2,750 unique patients Milestone 6: I-14 Estimated Incentive Payment *(maximum amount):* $1,324,281	
Year 2 Estimated Milestone Bundle Amount: *(add incentive payments amounts from each milestone):* $2,593,638	Year 3 Estimated Milestone Bundle Amount: $2,652,674	Year 4 Estimated Milestone Bundle Amount: $2,648,562	Year 5 Estimated Milestone Bundle Amount: $2,138,590
TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add milestone bundle amounts over Years 2-5):* $10,033,464			

Project Option 2.6.2 – Establish self-management programs and wellness using evidence-based designs (Disease Outbreaks and Sentinel Events Education)

Unique Project ID: 121758005.2.1
Performing Provider Name/TPI: Dallas County Health and Human Services/121758005

Provider: The mission of the Dallas County Department of Health and Human Services (DCHHS) is to protect the health of the citizens of Dallas County through disease prevention and intervention, and through promotion of a healthy community and environment. DCHHS serves a population of 2.4 million persons through outpatient health programs primarily focusing on communicable diseases. The health department has a staff of approximately 300; and workload measures include 24,486 STD clinic visits, 824 HIV clinic visits, and 16,967 TB clinic visits. As a public health contributor to this waiver proposal, DCHHS has also received reports of 11,310 communicable disease cases and administered 127,181 vaccines to children. The Texas Department of State Health Services Public Health Funding and Policy Committee encouraged local health authorities (DCHHS) to work with their regional anchors to be included in their respective 1115 waiver regional healthcare planning initiatives. Our public health QI initiatives align with our service capacity and have been designed as best as possible to fit the hospital-based 1115 waiver metrics and outcomes.

Project Description: Implement new evidence-based health promotion for disease prevention for persons living with preventable conditions (STDs, TB, etc.). This project will involve the dissemination of information on disease prevention and DCHHS services. The goal is to expand access to health promotion to increase community awareness of disease risks and health screenings.

The interventions will be based on CQI implementation techniques that test health promotion strategies using the Plan-Do-Check-Act (PDCA) CQI Deming Cycle (PDCA Cycle, American Society for Quality, 2012). Using PDCA, a specific guide for locally appropriate health promotion strategies will be developed, tested using pre and post participant assessments, incrementally adjusted and implemented at an increasing number of community sites throughout the project years (The ABCs of PDCA, National Association of County and City Health Officials, 2011). The Year 2 and 3 health promotion interventions that display the best participant responses regarding intended behavior change to seek clinical preventive services will be implemented in Years 4 and 5.

The evidence-base of the health promotion strategies to be tested will rely on the frameworks presented in NIH Making Health Communication Programs Work (2008). Pre and post participant assessment questions will be based on NIH Theory at a Glance, Stages of Change (2009) and NIH Theory at a Glance Theory of Planned Behavior (2009) to determine if participants are more or less likely to seek screening services and improve their health behaviors regarding preventable conditions. The Year 2 and 3 health promotion interventions

that display the best participant responses regarding intended behavior change will be implemented in Years 4 and 5.

Need for the Project: *CN.3 Healthcare Capacity.* Health promotion strategies to increase awareness of disease risk and clinical preventive services encourage decreased utilization of unnecessary specialty or emergency care in the future. This is a new QI initiative, as DCHHS currently does not have any health educator positions for this purpose. Dallas County's incidence of reportable infectious diseases is lower than the Texas average, but incidence of sexually transmitted diseases is higher than found throughout the State (e.g. Chlamydia 39% higher, Gonorrhea 71% higher). Dallas County's tuberculosis rate is higher than Texas overall (Rate: 8.4/100,000). In general, these conditions are both communicable and chronic as new technologies support extended life spans, treatment, or cures among those with diagnoses (HORIZONS: The Dallas County Community Health Needs Assessment (2012). Therefore, the need for this project is to reduce preventable hospitalizations relating to these conditions.

Target Population: This project will serve residents in areas of high communicable disease incidence to inform them of disease risks and screening opportunities. The estimated number of participants will be 840 indigent or uninsured clients across all DSRIP years (at least 10 per site estimate). DCHHS collect epidemiologic data at the ZIP code level to determine priority communities for health education. The number of sites where health education for screening takes place will increase by year, starting at 12 local community sites (e.g. churches, recreation centers, etc.), then 18, 24, and 30 sites in the following DSRIP years. 75215 and 75216 are at the highest risk for health disparities (Community Need Index, Dignity Health, 2012).

Category 2 Patient Benefits: The project seeks to implement innovative health education plans to increase awareness of screening resources. New ideas, practices, and tools based in the Diffusion of Innovation public health theory, CQI principles, and evidence-based best practices will be tested in DY2 and DY3, and adopted as official practice in DY4 and DY5.

Category 3 Outcomes: Health promotion of screening services offered at DCHHS and throughout the community supports our functionality as a health department offering outpatient screening services to decrease disease transmission. The public health planning, CQI approach, and pre/post survey design will evaluate Category 3 knowledge and intent regarding behaviors/services IT12.5, IT-11.2 and IT-11.3 with discrete questions in these areas, including the intended facility in the regional partnership (or otherwise) to obtain the services. In summary, DCHHS will serve as the performing provider to address the following Category 3 outcomes: 121758005.3.3 and 121758005.3.4 and 121758005.3.8.

Project Description

Dallas County will disseminate information on current and/or prior disease outbreaks and public health preparedness in Dallas County. This project will promote preventive screenings, decreases public impact, and decrease potential healthcare treatment costs in the event of an outbreak or public health preparedness response.

Goals and Relationship to Regional Goals

The goal is to expand access to health promotion and disease prevention behavior to increase community awareness of disease risk and health screenings for outbreaks.

This project will increase community access to health information on disease prevention and thus meets the regional goal of coordinating care beginning with preventive education that will promote health awareness and possibly reduce unnecessary care.

Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Challenges

The major challenges in implementing health promotion programs include: 1. Attributing health behavior changes to specific health promotion efforts versus the environment, 2. Monitoring longitudinal adherence to new health behaviors, such as seeking screening, 3. Correlating specific health promotion efforts with disease data trends that often take up to ten years to evolve and confirm. Pre- and post-test administration proposed in this project can address the first challenge, and offer an opportunity to consider the second challenge. The third challenge cannot serve as a deterrent to health promotion, because without initiating the promotion, the disease trends would remain unchanged. Additional administrative challenges for this QI initiative include accessing community members in underserved areas or having limited access to transportation, technology, media, and other typical means of communication for health screening information.

5-Year Expected Outcome for Provider and Patients

Expanded health information access will increase real-time awareness of screening, treatment, and risk among the underserved communities and throughout the county.

Starting Point/Baseline

This program has not begun, thus the starting point is '0'.

Rationale

Dallas County has recently experienced several conditions requiring public health preparedness. Educating the community on these past and potential future circumstances can mitigate community risk and promote rapid response and health screenings. Disease management emphasizes prevention of disease-related exacerbations and complications using evidence-based guidelines and empowerment tools. It can help manage and improve the health status of a defined patient population over the entire course of a disease (HHSC, 2012).

Project Components

There are no project components for this project option.

Unique Community Need Identification Numbers the Project Addresses

CN.3 – Healthcare Capacity

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

Although information has been provided throughout the region, this will provide an opportunity for new information to be disseminated in a coordinated manner through various identified locations (identified by zip code)

Related Category 3 Outcome Measure(s)

OD-11: Addressing Health Disparities in Minority Populations

- IT-11.2: Improvement in disparate health outcomes for target population, including identification of disparity gap (Non-standalone Measure)
- IT-11.3: Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity (Non-standalone Measure)

OD-12: Primary Care and Primary Prevention

- IT-12.5: Other USPSTF-endorsed screening outcome measure (Non-standalone Measure)

Reason/Rationale for selecting outcome measures

Public health serves the community at-large and can educate underserved communities on disease outbreaks, thereby improving these Category 3 outcomes. The intent to adopt positive health behaviors concerning these outcomes can be evaluated in the public health education setting using pre and post assessments using Stages of Change/Theory of Planned Behavior as the public health evaluation framework. Developing health promotion programs these frameworks require new ideas, practices, tools, and solutions that can be considered a metric for progress (NIH Making Health Communication Programs Work, 2008). Upon implementation, pre- and post-assessments indicate a measure of those who have been

reached by the intervention, and also seek to determine where participants intend to seek preventive screening. Ten percent improvement from pre-assessment score to the post-assessment score indicates a the standard goal for increasing the knowledge base of the participant (American Society for State and Territorial Health Officials, Memo, 2013; CDC Healthy People 2020). DCHHS aims for this outcome improvement goal in DY5 to allow time for trials and modification upon implementation.

Relationship to Other Projects

This is a closed-loop project. There are no other projects being submitted that are related to this initiative.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

There is no other project being submitted by other performing providers that is similar to this project.

Project Valuation

The rationale for valuing the project is based on community benefit due to decreasing preventable hospitalizations. Each health promotion participant was calculated to be one less person entering into the local healthcare delivery system.

The following valuation is based on a literature review of various community health worker/health educator interventions that include economic impact analyses. The example interventions are population-based in the community setting with consistent costs, and do not include hospital-based treatment and equipment interventions that would display increased cost variability.

Valuation examples are from: Social return on investment: Community Health Workers in cancer outreach, American Cancer Society Midwest Division (2012); Community Health Workers in Massachusetts: Improving Health Care and Public Health, Massachusetts Department of Health, Office of Community Health Workers (2009); and Outcomes of Community Health Worker Interventions, Agency for Healthcare Research and Quality (2009).

The DCHHS approach for valuing the first outcome measure is based on financial and human capital resources governing the capacity of the health department to implement a health promotion program that required planning, travel, and new staff.

Project Option 2.6.2 – Establish self-management programs and wellness using evidence-based designs (STD, TB, and Immunizations Health Education)

Unique Project ID: 121758005.2.2
Performing Provider Name/TPI: Dallas County Health and Human Services/121758005

Provider: The mission of the Dallas County Department of Health and Human Services (DCHHS) is to protect the health of the citizens of Dallas County through disease prevention and intervention, and through promotion of a healthy community and environment. DCHHS serves a population of 2.4 million persons through outpatient health programs primarily focusing on communicable diseases. The health department has a staff of approximately 300; and workload measures include 24,486 STD clinic visits, 824 HIV clinic visits, and 16,967 TB clinic visits. As a public health contributor to this waiver proposal, DCHHS has also received reports of 11,310 communicable disease cases and administered 127,181 vaccines to children. The Texas Department of State Health Services Public Health Funding and Policy Committee encouraged local health authorities (DCHHS) to work with their regional anchors to be included in their respective 1115 waiver regional healthcare planning initiatives. Our public health QI initiatives align with our service capacity and have been designed as best as possible to fit the hospital-based 1115 waiver metrics and outcomes.

Project Description: Implement new evidence-based health promotion for disease prevention involving sentinel events. This project will involve the dissemination of information on current and/or prior disease outbreaks and public health preparedness in Dallas County. The goal is to expand access to health promotion to increase community awareness of disease risk and health screenings for large outbreaks that may include sentinel events.

The interventions will be based on CQI implementation techniques that test health promotion strategies using the Plan-Do-Check-Act (PDCA) CQI Deming Cycle (American Society for Quality, 2012). Using PDCA, a specific guide for locally appropriate health promotion strategies will be developed, tested using pre and post participant assessments, incrementally adjusted and implemented at an increasing number of community sites throughout the project years (National Association of County and City Health Officials, 2011). The Year 2 and 3 health promotion interventions that display the best participant responses regarding intended behavior change to seek clinical preventive services will be implemented in Years 4 and 5.
The evidence-base of the health promotion strategies to be tested will rely on the frameworks presented in NIH Making Health Communication Programs Work (2008). Pre and post participant assessment questions will be based on NIH Theory at a Glance, Stages of Change (2009) and NIH Theory at a Glance Theory of Planned Behavior (2009) to determine if participants are more or less likely to seek screening services and improve their health behaviors regarding pending outbreaks/sentinel events. The Year 2 and 3 health promotion interventions that display the best participant responses regarding intended behavior change will be implemented in Years 4 and 5.

Need for the Project: *CN.3 Healthcare Capacity*. Health promotion strategies to increase awareness of disease risk and clinical preventive services encourage decreased utilization of unnecessary specialty or emergency care in the future. This is a new QI initiative, as DCHHS currently does not have any health educator positions for this purpose. A significant outbreak of West Nile virus occurred during the summer of 2012 requiring both ground and aerial spraying to address over 300 cases (HORIZONS, 2012). Dallas County effectively implemented public health preparedness measures engaging federal, state, and local partners to monitor and control the outbreak (pending as of the date of this submission). There have also been past flu and hepatitis outbreaks that deserve attention during this QI initiative as well. Therefore, the need for this project is to reduce preventable hospitalizations relating to these conditions.

Target Population: This project will serve residents in areas of high communicable disease incidence to inform them of disease risks and screening opportunities. The estimated number of participants will be 900 indigent or uninsured clients across all DSRIP years (at least 30 per ZIP estimate). DCHHS collect epidemiologic data at the ZIP code level to determine priority communities for health education. The number of sites where health education for screening takes place will increase by year, starting within 3 ZIP codes, then 6, 9, and 12 ZIP codes in the following DSRIP years. 75215 and 75216 are at the highest risk for health disparities (Community Need Index, Dignity Health, 2012). This project requires epidemiological evidence-based targeting that will be based on high incidence ZIP codes affected by the current or past sentinel event.

Category 2 Patient Benefits: The project seeks to implement innovative health education plans to increase awareness of screening resources. New ideas, practices, and tools based in the Diffusion of Innovation public health theory, CQI principles, and evidence-based best practices will be tested in DY2 and DY3, and adopted as official practice in DY4 and DY5.

Category 3 Outcomes: Health promotion of screening services offered at DCHHS and throughout the community supports our functionality as a health department offering outpatient screening services to decrease disease transmission. As a public health contributor serving the community at-large, Dallas County will use pre and post assessment surveys from screening educational sessions will serve as the improvement milestone for screening seeking behaviors. The public health planning, CQI approach, and pre/post survey design will evaluate Category 3 knowledge and intent regarding behaviors/services IT12.5, IT-11.2 and IT-11.3 with discrete questions in these areas, including the intended facility in the regional partnership (or otherwise) to obtain the services. In summary, DCHHS will serve as the performing provider to address the following Category 3 outcomes: 121758005.3.6, 121758005.3.7, and 121758005.3.9.

Project Description

Dallas County will disseminate information on communicable disease prevention and DCHHS services.

Goals and Relationship to Regional Goals

The goal is to expand access to health promotion and disease prevention behavior to increase community awareness of disease risk and health screenings.

This project will increase community access to health information on a preventive basis, which decreases public impact and potential healthcare treatment costs in the event of an outbreak. Thus, it meets the regional goal of coordinating care beginning with preventive education that will promote health awareness and possibly reduce unnecessary care that is a sentinel event (e.g. West Nile outbreak).

Learning Collaborative:

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Challenges

The major challenges in implementing health promotion programs include: 1. Attributing health behavior changes to specific health promotion efforts versus the environment, 2. Monitoring longitudinal adherence to new health behaviors, such as seeking screening, 3. Correlating specific health promotion efforts with disease data trends that often take up to ten years to evolve and confirm. Pre- and post-test administration proposed in this project can address the first challenge, and offer an opportunity to consider the second challenge. The third challenge cannot serve as a deterrent to health promotion, because without initiating the promotion, the disease trends would remain unchanged. Additional administrative challenges for this QI initiative include accessing community members in underserved areas or having limited access to transportation, technology, media, and other typical means of communication for health screening information.

5-Year Expected Outcome for Provider and Patients

Expanded health information access will increase awareness of screening, treatment, and risk among the underserved communities and throughout the county.

Starting Point/Baseline

This program has not begun, thus the starting point is '0'.

Rationale

Dallas County has high communicable disease rates in comparison to Healthy People 2020 goals, and information on risks and screening can improve these rates. Disease management emphasizes prevention of disease-related exacerbations and complications using evidence-based guidelines and empowerment tools. It can help manage and improve the health status of a defined patient population over the entire course of a disease (HHSC, 2012).

The rationale for valuing the project is based on community benefit due to decreasing preventable hospitalizations. Each health promotion participant was calculated to be one less person entering into the local healthcare delivery system.

The following valuation is based on a literature review of various community health worker/health educator interventions that include economic impact analyses. The example interventions are population-based in the community setting with consistent costs, and do not include hospital-based treatment and equipment interventions that would display increased cost variability.

Valuation examples are from: Social return on investment: Community Health Workers in cancer outreach, American Cancer Society Midwest Division (2012); Community Health Workers in Massachusetts: Improving Health Care and Public Health, Massachusetts Department of Health, Office of Community Health Workers (2009); and Outcomes of Community Health Worker Interventions, Agency for Healthcare Research and Quality (2009).

The DCHHS approach for valuing the first outcome measure is based on financial and human capital resources governing the capacity of the health department to implement a health promotion program that required planning, travel, and new staff.

Project Option 2.15.1 – Primary Care Integration

Unique Project ID: 137252607.2.1
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/ 137252607

Provider: Metrocare Services is a community-based behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: This project will create an integrated model of easy, open access to primary care services for persons who are receiving behavioral health services in our community based behavioral health clinics. This effectively establishes a 'one stop shop' for patients to receive both behavioral and primary care services on the same day.

Need for the project: Persons with serious and persistent mental illnesses have life expectancies which are 25 years less than the general population. They frequently have difficulty with reliable or affordable transportation and have problems accessing and engaging in routine medical services, thereby experiencing increased morbidity and mortality. They also have increased use of local hospital emergency rooms. At present, the wait time for new patients to access primary care services at local community primary care clinics can be up to 6 months, and existing primary care clinics are often not conveniently located or easily accessible to where patients live.

Target population: The target population is Metrocare patients who are diagnosed with a severe and persistent mental illness as defined by the Texas Department of State Health Services, who are enrolled in community mental health services and who are in need of primary care services in an integrated behavioral and primary health care setting.

Category 1 or 2 expected patient benefits: The goals of this project include:
- Increase numbers of patients receiving integrated behavioral and physical healthcare services during each year of the project (DY 2-500; DY 3-1500; DY 4-1200; DY 5-3500)
-Increase the percentage of patients who report satisfaction with integrated services at Metrocare community clinics as measured by the Consumer Assessment of Healthcare Providers and Systems (DY 2-60%; DY 3-70%; DY 4-80%; DY 5-90%)

Category 3 outcomes: The goals of this project include:
-Improved performance measures on HEDIS criteria for diabetes, HTN, CAD, COPD/Asthma, and smoking cessation
-Increased preventive care utilizations for persons with mental illnesses, including increased Immunization rates, improved breast, colon, cervical and prostate cancer screenings
-Decreased use of emergency departments
-Decreased hospitalization rates

-Decreased per capita health care costs

Project Description

Expand the availability of integrated behavioral and physical healthcare to persons with severe and persistent mental illnesses in community mental health clinics.

As identified in the Community Needs Assessment for Region 9, a number of medical diagnoses which account for high volumes and frequent visits to emergency departments are either preventable or treatable in a lesser acute environment. The report also indicates that persons with severe mental illnesses are less likely to access regular care and are likely to receive a lesser quality of medical care (Collins, 2012. RHP 9: Community Needs Assessment Report). This project will establish a total of four integrated behavioral and physical healthcare clinics by Year 5 of the project and is expected to provide integrated behavioral and physical healthcare services to 3500 person by Year 5 of the project. These clinics will be staffed with psychiatrists, primary care physicians, Advanced Nurse Practitioners who are cross-trained in behavioral and physical healthcare, RN's, LVNs/medical assistants, Licensed Professional Counselors/Licensed Clinical Social Workers, Licensed Chemical Dependency Counselors, and case management staff.

Goals and Relationship to Regional Goals

The goal of this project is to expand medical care to persons with severe and persistent mental illnesses in an integrated, easily accessible environment where both behavioral and physical health practitioners have input into treatment planning and access to relevant information which may have impact on a patient's mental and physical well-being. The Region 9 Community Needs Assessment reports that the top 10 utilizers of emergency services in Region 9, in 2011, all had diagnoses of mental illness, but none presented to emergency departments with chief complaints related to their mental illnesses. In Dallas County, the presence of a "co-occurring behavioral health condition is associated with increased case severity of medical encounters and a 36% in the average charges per encounter." (Collins, 2012). By establishing community clinics which integrate behavioral and physical health care, there is the opportunity for improved communication between mental and physical healthcare providers, allowing the team to intervene in medical or behavioral illnesses before a higher level of care is necessary, as well as providing the patient an easily accessible alternative to the use of emergency services. Establishment of integrated community clinics would result in less frequent use of emergency services and decreased healthcare service costs to the Region

Challenges

- The Region 9 Community Needs Assessment (Collins, 2012) indicates that Region 9 is below average in the number of primary care physicians. Hiring and retaining primary

care physicians is expected to become a greater challenge over the next several years, as competition for these providers increases.

- Development of an adequate, easy to access medical specialty referral base
- Establishment of providers for laboratory and other diagnostic services
- Engagement of persons with serious and persistent mental illnesses in preventive care practices
- Engagement and facilitation of having patients utilize community integrated services as alternative to the utilization of more acute levels of care

5-Year Expected Outcome for Provider and Patients

- Improved performance measures on HEDIS criteria for Diabetes, HTN, CAD, COPD/ Asthma, Smoking cessation etc.
- Increased preventive care utilizations such as increased preventive care immunization rates in the MH clients, improved breast, colon and cervical cancer screening etc.
- Decreased ER utilization rate
- Decreased hospitalization
- Decreased per capita health care costs.

Starting Point/Baseline

The baseline for measures is zero

Rationale

The Region 9 Community Assessment (Collins, 2012) identifies the need for "development of lower levels of care in order to prevent the need for high-cost services" in our community. For Dallas County, the presence of a 'co-occurring behavioral health condition is associated with increased case severity of medical encounters and a 36% increase in the average charges per encounter (Collins, 2012). Lack of community based services also results in "significantly overcrowded emergency rooms" for people seeking crisis services. By providing integrated services within Metrocare's community based integrated care clinics, behavioral and physical healthcare staff can assist patients with stabilization of both symptoms of mental illness, as well as prevention or stabilization of physical health illnesses. The result of engagement and treatment in an integrated environment will result in decreased use of higher levels of care, improved patient functioning, improved HEDIS measures for chronic medical illnesses,

improved patient satisfaction outcomes and a decrease in local dollars spent on emergency room visits for patients with comorbid mental and physical illnesses. The integrated medical record, regular team meetings and case conferences, as well as ongoing CQI meetings will assist behavioral health and physical health providers in identifying barriers to engagement and outcome improvements. The North Texas Behavioral Health Authority has identified transportation as one of the major barriers to individuals accessing services (Collins, 2012). The four community mental health clinic sites targeted for integration are all located on Dallas Area Rapid Transit bus routes or rail lines, and are also located on high capacity local streets, easily accessible by major highways.

As per Dallas county community health dash board Parkland Health and Hospital systems:

- 34.1 % of Emergency room visits in Dallas County in 2010 are for non emergent conditions. We are located in Dallas County and by providing open access to primary care services we will be able to decrease the ED visits for non emergent conditions.
- The number of primary care physicians per 100,000 population in Dallas county is 82.3 in 2010 compared to Texas average of 95.2 – Having primary care services in Metrocare will increase the access to preventive care utilization there by decreasing health care costs.
- Dallas county Health outcomes on heart disease death rate, cancer death rate, stroke death rate and COPD death rate were worse than the bench mark when compared to 8 peer counties. . By offering Primary care services in Dallas county locations of Metrocare we will be able to decrease non emergent ED visits, increase preventive care utilizations, improve health outcomes and decrease health care costs

Project Options: Core Components

2.15.1 Design, implement, and evaluate projects that provide integrated primary and behavioral health care services.

Required core components:

a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community.

   -Co-located, closely collaborated behavioral and primary care services will occur in four currently existing Metrocare outpatient clinics by Year 5 of the project. These clinics are proximately located to zip codes which have been identified to have high rates of chronic disease occurrence (Collins, 2012)
   -Clinics are located within Dallas County in Region 9 and serve approximately 17,000 persons per month.

b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated.

-Scheduling for behavioral and physical health services currently exist as a part of Metrocare's electronic health record (EHR)
-Metrocare's current EHR has the capacity for development into an integrated behavioral and primary health care record which will allow for information sharing between behavioral health and primary care providers
-Patients will sign a release of information document which allows for information exchange between behavioral and primary care providers

c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers

-Co-located behavioral and primary care staff, integrated scheduling, and integrated EHR all serve to enhance communication, data-sharing, and referral between behavioral and physical health providers.
-Formal protocols and processes for referral will be completed in year 2

d) Recruit a number of specialty providers (physical health, mental health, substance abuse, etc. to provide services in the specified locations.

-Mental health and chemical dependency specialists are currently co-located within Metrocare clinics and will offer services to patients referred by primary care practitioners
-Physical health staff are being recruited and hired and will operate within the same location as behavioral health and chemical dependency staff. Primary care staff will accept patients referred by behavioral health care staff
-Family Practice Advanced Nurse Practitioners will be cross-trained in diagnosing and treating behavioral health issues

e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:

-Daily morning meetings between behavioral and physical healthcare staff for preview of the day's schedule, and brief consultation among team members as clinically indicated
-Case conferences will be scheduled on a weekly basis, but may occur on an as-needed basis whenever the behavioral or physical health teams deem necessary
-Metrocare's HER has the capacity to develop and integrated treatment plan should behavioral health services cease to be a carve-out in the future. However, treatment plans will have input from both behavioral and physical healthcare providers.

f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in health information exchange-depending on the size and scope of the local project.

-Metrocare's current EHR has the capacity to collect data in an integrated setting

g) Explore the need for and develop any necessary legal agreement that may be needed in a collaborative practice.

-Patients who are engaged in both behavioral and physical healthcare services will sign a release of information document, allowing for information sharing among behavioral and physical healthcare staff primary care staff

h) Arrange for utilities and building services for these settings.

-Utilities and building services are already in place as a part of Metrocare's routine facility management department, including the handling of bio hazardous materials and routine cleaning and maintenance. These services will be expanded to any areas designated for the provision of physical healthcare

i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services, as well as the healthcare outcomes of individuals treated in these integrated service settings.

-The currently available centralized scheduling system, provides ability to track utilization of integrated services
-Metrocare's integrated EHR will provide the ability to track healthcare outcomes

j) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying 'lessons learned,' opportunities to scale all or part of the project to a broader patient population and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.
-Continuous Quality Improvement (CQI) will be undertaken by utilization of the rapid cycle improvement process in one integrated clinic location prior to expansion of the model to multiple other sited
-The integrated healthcare team will examine positive impacts, as well as outcomes which do not meet expectations, with a goal of continuous improvement of outcomes, customer satisfaction and expansion of services

Unique community need identification numbers the project addresses

CN.6: Primary care and behavioral health

How the project is a significant enhancement to an existing delivery system reform initiative

This project will significantly enhance access to primary care services for persons with severe and persistent mental illnesses in Dallas County.

Related Category 3 Outcome Measure(s)

- IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)

Rationale: Numerous clinical trials have shown that aggressive treatment of high blood pressure reduces mortality from heart disease, stroke and renal failure.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance services along the continuum:

137252601.1.1	Metrocare—Workforce Enhancement
137252607.2.2	Metrocare –ACT (Assertive WRAP-around Program)
137252607.2.3	Metrocare—Family Preservation
137250607.2.4	Metrocare—Center for Children with Autism
137250607.2.5	Metrocare—Day Program

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Learning Collaborative—Metrocare plans to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV—Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

By offering easy access preventive services, case management, chronic disease management, health education and care coordination, we will be able to improve the quality of life and life expectancy of our clients. A randomized trial study by Druss et al in 2001 showed that integrated medical care in patients with serious psychiatric illness have increased preventive care utilization and greater improvement in health (Druss, B et al, 2001).
We based our valuation on IMPACT research trails which showed greater quality outcomes and improved health care costs. Lower long term savings on health care costs (4 yr) were up to $3,363 per patient. They had lower health care cost in every category including but not limited to outpatient and inpatient medical and surgical costs, pharmacy costs and other outpatient costs. (Mauer & Jarvis, 2010). Our goal is to serve 4000 clients by year four the cost savings will be 3500x $3,363 = $**11,770,500**.
