Project Option 2.13.1 – Assertive Community Team for Persons with Developmental Disabilities

Unique Project ID: 137252607.2.2
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/ 137252607

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: The ACT Team will be on-call to travel to the acute care facility, jail or school to help assess and stabilize consumers and will also provide follow-up services to those clients to ensure the destructive pattern that led to the need for acute services is eliminated or significantly reduced. A licensed therapist will manage the daily operations of this program, with behavior intervention staff carrying small caseloads of no more than 10 consumers. The direct care staff will make multiple home and/or community face-to-face visits each week. ACT clients will receive at minimum, 8 hours of services per month.

Need for the project: The Region 9 Community Assessment identifies that there are insufficient community based programs that provide crisis intervention and stabilization services to effectively and efficiently reduce the utilization of higher levels of care (i.e. ERs, hospitals, jails and detention facilities). Further, the staff members in these facilities are often not trained to successfully assess and provide for the needs of individuals with developmental disabilities. An ACT program for clients with developmental disabilities will allow Metrocare to utilize its specially trained staff to assist in crisis situations at community locations and then provide the ongoing services needed to avoid crisis in the future.

Target population: The target population includes indigent patients or those insured by Medicaid that have a developmental disability and are in need of intensive intervention due to consistent demonstration of alarming behaviors that result in hospitalization or arrest. The project estimates to serve 27 clients in year 3, 41 clients in year 4 and 54 clients in year 5.

Category 1 or 2 expected benefits: The goal of this project is to increase the number of clients served each year (DY 3 27, DY 4 41, DY 5 54) and to decrease patient utilization rates of out-of-home treatment facilities for those served by ACT by 70% in DY 4 and 75% in DY 5.

Category 3 outcomes: The goal for this project is improved Quality of Life: IT-10.1

- DY 4 – 25% of those served will report improved quality of life/functional status. Data source: Achenbach System of Empirically Based Assessment (ASEBA)
- DY 5 – 50% of those served will report improved quality of life/functional status. Data source: Achenbach System of Empirically Based Assessment (ASEBA)

Project Description

Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting.

Currently people with developmental delays and who have behavior issues usually end up in acute care hospitals or jails. We know that professional staff in those facilities are not specifically trained or equipped to successfully assess, and provide for the needs of these individuals. The episodes can be lengthy and the consumers are integrated with the general public often raising risk for themselves and others. At times the consumer is simply medicated and released back to the care of their personal caregiver without proper assessment and/or treatment to help them be successful in the future. This often causes a cycle of readmissions to the emergency room and/or hospital.

The judicial system is even less likely to provide the needed services. Often following arrest, the consumers are released without any follow-up and the pattern is often repeated over and over.

The cost to the community is significant.

To address this, the Behavior Treatment Services Assertive Community Wrap-around Treatment Team (ACT) will be on-call to travel to the acute care facility, jail, or school to help assess and stabilize the situation and then provide follow –up services to ensure the destructive pattern that led to the need for acute services is eliminated or at least significantly reduced. A licensed therapist will manage the day to day operations and behavior intervention staff will carry small caseloads of no more than 10 consumers each. The staff will make multiple home/community face-to-face visits each week.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

The goal is to decrease potential readmission to psychiatric facilities and incarcerations and to stabilize the individual within the home and community setting and to provide behavioral services to increase individual, family, and community safety and to address needs that will keep the individual in the home and community.

The Region 9 Community Needs Assessment highlights that “an inadequate supply of behavioral health services is one of the most significant unmet health needs” of our community (Collins, RHP 9 Community needs assessment report, 2012). The implementation of an Assertive Community Wrap around Treatment Team (ACT) will address the community needs outlined in this assessment by maintaining individuals in their homes while increasing relevant

and effective services to those individuals and their caregivers. This model will decrease the time and cost associated with multiple hospitalization/emergency department visits, involvement with criminal justice system and institutionalization.

Additionally, this meets the regional goal of coordinated care for persons with behavioral needs.

Challenges

According to the Texas Council for Developmental Disabilities (TCDD), approximately 475,265 people in the state of Texas are diagnosed with a Development Disability. An APA task force estimated that 30-70 % of persons diagnosed with a developmental disability will experience the effects of a mental health condition at some point in their lifetime. Due to the high prevalence rate of persons with developmental disabilities having a co-occurring mental health condition, there is a need in the community for appropriate resources that address both challenges. Furthermore, accessibility to trained staff, crisis intervention, and support services has been found to be a major barrier for this population. Due to the inaccessibility of services for this population, persons with developmental disabilities who have severe behavior issues often end up in Psychiatric Emergency Rooms. Care givers and/or law enforcement bring the consumers to the ER due to the consumer manifesting extreme behaviors that are a danger to the consumer and/or others. Once at the psychiatric emergency room, hospital personnel are not usually specifically trained in how best to work with individuals with disabilities. The situation can be become more intense as the consumer is mixed with the general population. This often leads to instability across multiple consumers. The consumer can be in the emergency room for lengthy periods of time as a solution is sought.

If the care giver calls the local police department, the officers who respond are not trained behavioral clinicians and a situation that could possibly be defused results in an arrest. The person with disabilities, if taken to jail, is housed with the general population without the cognitive capacity or adaptable coping skills to deal with the often hostile environment.

Currently there are no local organizations that provide ACT type services to this specific population. The result, as described above, is a revolving door for these individuals, in and out of the hospital and/or jail, with little intervention done to stop the cycle. Metrocare provides outpatient services to clients with developmental disabilities and mental illness, but cannot, in its current capacity, provide intensive ACT services to client dually diagnosed and frequent users of higher levels of care. The goal of the ACT program would be to provide that immediate stabilization and then transition the client to traditional outpatient services for maintenance.

5-Year Expected Outcome for Provider and Patients

- Recruit and train community health workers to serve in the program.

- Increase number of people with developmental disabilities served by team by 27 over baseline.
- Increase number of people with developmental disabilities served by team by 41 over baseline.
- Increase number of people with developmental disabilities served by team by 54 over baseline.
- Decrease the rate of Emergency Room Visits and readmissions to psychiatric hospitals for those served
- Decrease rate of criminal justice involvement for those served
- Decrease referral to or placement in a state supported living facility

Starting Point/Baseline

Baseline for measures (clients served, number of encounters, and number of trained staff) is zero. Hiring, training of staff and enrollment of the initial 27 clients to be served will occur in DY 3.

Rationale

As described in the Region 9 Community Assessment (Section IV Behavioral Health), there are insufficient community based programs that provide crisis intervention and stabilization services to effectively and efficiently reduce the utilization of higher levels of care (i.e. ERs, hospitals, jails and detention facilities). An ACT program for clients with developmental disabilities will allow Metrocare to utilize its specially trained staff to assist in crisis situations at community locations and then provide the ongoing services needed to avoid crisis in the future. This approach to treatment fosters frequent encounters in the home setting with a focus on building adaptive skills and resolving client needs to ensure stabilization in the home. Core components of the program will include psychiatric evaluation, behavioral assessment, medication management, crisis intervention, counseling and rehabilitative services, and group therapy.

Metrocare Services is the largest provider of mental health services in Dallas County. We serve approximately 1,000 people diagnosed with a developmental disability each month and 10,000 people diagnosed with a mental health disorder. To provide quality services to such a large population, we must implement programs that are proven to be effective with our families. Further, as a member of this community, we recognize the societal and financial impact that multiple psychiatric hospitalizations, CPS and/or juvenile justice involvement, and an

individual's removal from home can have on a family and the greater community. The ACT Program will take a comprehensive, systematic approach to treating individuals with complex needs, providing intensive services to quickly establish stabilization and then work rigorously to assist the individual/caregiver with getting needs met to sustain safety and stabilization. Through the efforts of this program, there will be a decrease in the number of individuals readmitted to psychiatric hospitals, involved in the criminal justice system, or placed in State Supported Living facility.

Project Components

This project has five required project components including:

A. Assess size, characteristics and needs of target population

B. Review literature/experience with populations similar to target population to determine community based interventions that are effective in averting negative outcomes

C. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes

D. Design models which include appropriate range of community-based services and residential supports

E. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis

Each of these required components are addressed in the Project Proposal by:

A. Conducting Needs Assessment

B. Conducting Needs Assessment and program design of interventions

C. Use of real time data for rapid cycle improvement for Continuous Quality Improvement; use of standardized tools (Metrocare Clinical Data System and the Achenbach) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning

D. Conduct Needs Assessment and program design of interventions

E. Use of standardized tools (Metrocare Clinical Data System and the Achenbach) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning

The ADEBA Approach: The Achenbach System of Empirically Based Assessment (ASEBA) offers a comprehensive approach to assessing adaptive and maladaptive functioning. Developed through decades of research and practical experience to identify actual patterns of functioning, the ASEBA provides professionals with user-friendly tools. The ASEVA assesses competencies, adaptive functioning, and behavioral, emotional, and social problems from age 1 ½ to over 90. Numerous studies demonstrate significant associations between ASEBA scores and both diagnostic and special education categories. You can relate ASEBA directly to DSM-IV diagnostic categories by using the DSM-oriented scales for scoring ASEBA forms.

The Process Milestones chosen for this project were derived from the RHP Planning Protocol. A customized improvement milestone was created to evaluate the program's success at reducing out-of-home treatment episodes including stays at a psychiatric hospital, criminal justice center or placement in a residential treatment facility. Metrocare chose to customize this improvement milestone because I-1 focuses only on admission/readmission to a criminal justice setting and would not capture the other facilities of focus. Milestone I-5, functional status, was not chosen as an improvement milestone because it would too closely measure a client's quality of life, which is Metrocare's identified Category 3 Improvement Target.

Unique community need identification numbers the project addresses

CN.5 Behavioral health
CN.6 Primary and behavioral care
CN.7 Behavioral health and jail population

How the project represents a significant enhancement to existing delivery system reform initiative

This project will significantly enhance behavioral health services through recruitment of community health workers to serve patients with behavioral needs. Additionally, by reducing the utilization rates of out-of-home treatment facilities, Metrocare will aid our community partners by alleviating the number of consumers seeking services and allowing those providers to focus on those clients in critical need for inpatient services.

Related Category 3 Outcome Measure(s)

IT 10.1 Quality of Life – as measured by the Achenbach System of Empirically Based Assessment (ASEBA)

The goal of the ACT Program is to provide intensive services to those individual diagnosed with a developmental disability that have experienced a psychiatric hospitalization, interaction with the criminal justice system, high rates of emergency department utilization, or are at-risk for placement in a State Supported Living facility. There are long lasting consequences to individuals and the community at large when a client endures multiple hospitalizations or

removal from home. These consequences include separation from family and deterioration of relationships and stigmatization due to involvement with the legal system. Research indicates that adequate outpatient services decrease hospital use for behavioral health issues (SdosReis, et.al, 2008); thus intensive services that are comprehensive, offering multiple services to address the unique needs of the individual must be provided. The services provided through ACT are proven effective at reducing hospitalizations and out-of-home placements while costing considerably less than expensive treatment episodes in the hospital, judicial system or residential treatment. These services will include 24 hour on-call crisis intervention, skills training, counseling, family/caregiver training, psychiatric evaluation and medication management. Implementing this variety and intensity of services allows a holistic approach to treatment; teaching the clients life skills and coping strategies that allows them to remain in their homes; stabilized with an increase quality of life. To evaluate the program's success regarding improving a client's quality of life, the ASEBA will be used to assess progress from admission to discharge.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance services along the continuum:

137252601.1.1
137252607.2.1
137252607.2.3
137250607.2.4
137250607.2.5

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

NA

Plan for Learning Collaboratives (if applicable)

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Metrocare Services determined the value of each project by comparing the budgeted cost of the specific project against the cost to the community should the services go unprovided. In

regards to the ACT Project, the significant cost of hospitalization, emergency room visits, detainment and placement in a State Supported Living Facility were used as comparison data against cost for the community-based ACT Project. The starting point/baseline for the program is zero, with a total census of 27 clients served at the end of DY 3. It is estimated that participation in ACT will result in less than 5% returning to the ER or hospital, less than 5% detained in jail and less than 2% placed in a State Support Living Facility. Metrocare projects that 25% of clients who participate in ACT services in DY 4 will report improved quality of life and 50% of those who participate in DY 5 will report improved quality of life.

Project Option 2.13.1 – Family Preservation Program

Unique Project ID: 137252607.2.3
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/ 137252607

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: FPP is a short-term, intensive program that provides crisis intervention, medication management, counseling and case management services to children recently released from the psychiatric hospital or those at-risk for out-of-home placement and their families. As part of this intensive model, clients will receive at minimum 8 hours of services per month.

Need for the project: A recent study published by the Journal of the American Academy of Child and Adolescent Psychiatry concluded that "psychiatric rehospitalization of children is common, most likely in the trimester after discharge and is highly related to both child symptoms and family factors measurable at admission" (Blade, J.2003). Further, the Region 9 Community Needs assessment highlights that "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our community and that "nearly all intensive services, including evidence-based programs, are provided through the Juvenile Justice System" (Collins, 2012). The implementation of a Family Preservation Model would allow Metrocare to provide intensive, community-based services that are proven to reduce costly out-of-home treatment episodes and addresses priority goals identified in the Region 9 community Assessment Report.

Target population: FPP will serve children and adolescents from psychiatric facilities and/or those at-risk for out-of-home placement due to juvenile justice involvement or placement in residential treatment. The program has projected to serve 200 clients in year 3, 240 clients in year 4 and 280 clients in year 5. The target population will be indigent patients or those covered by Medicaid.

Category 1 or 2 expected benefits: The FPP project will increase the number served in the program each year (DY 3 – 200, DY 4 240, DY 5 – 280) and will decrease patient utilization rates of out-of-home treatment facilities for those served in the FPP Program by 70% for DY4 and 75% for DY 5.

Category 3 outcome: The goal of the FPP Project is improved Quality of Life (IT-10.1):

- Dy 4 – 65% of clients surveyed will report improved quality of life from admission to discharge (Data Source – Child and Adolescent Needs and Strengths Assessment and Metrocare Clinical System)

- DY 5 – 75% of clients surveyed will report improved quality of life from admission to discharge (Data Source – Child an d Adolescent Needs and Strengths Assessment and Metrocare Clinical System)

Project Description

Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting

A Family Preservation Program will serve youth discharged from psychiatric facilities and/or those at-risk for out-of-home placement due to juvenile justice involvement or placement in residential treatment. FPP is a short-term, intensive program that provides medication management, counseling and case management services to clients and immediate family. Participates have access to an on-call clinician to address crisis, in attempt to avoid readmission to hospital or police/juvenile justice involvement. A comprehensive assessment is completed during the first stage of enrollment to identify all client and family needs that influence potential future hospitalizations or removal from the home. Children and their families receive face-to-face services two times per week minimum and services are held at home or in the community on day/time convenient to the family. Clients can be enrolled in the FPP program for a maximum of 3 months and upon discharge, will transition to a less intensive form of outpatient services. During the client's enrollment in FPP, they will receive a minimum of 8 hours of service per month.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

The goal is to decrease potential admission/readmission to out-of-home treatment facilities (i.e. hospital, detention centers, and/or residential treatment); stabilizing the child within the home and community setting by providing medication management, counseling and case management services to increase family safety and aide in addressing familial needs that will keep the child in the home and community.

The Region 9 Community Needs Assessment highlights that "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our community (Collins, RHP 9 Community needs assessment report, 2012). In addition, "mental health services available to children are limited" and services "oftentimes do not include the family-focused and comprehensive approach needed to adequately address" client issues (Collins, 2012). Further, the Needs Assessment reports that "nearly all intensive services, including evidence-based programs, are provided through the Juvenile Justice System" (Collins, 2012). The implementation of a Family Preservation Program will address the community needs

outlined in this assessment by maintaining youth in their homes while increasing relevant and effective services to those clients and their families. This model will decrease the time and cost associated with multiple hospitalization, involvement with Juvenile Justice and placement outside of the home.

Additionally, this project meets the regional goals of coordinating care for patients with behavioral needs.

Challenges

Comprehensive assessments of children and adolescents reveal that many children who experience multiple psychiatric hospitalizations and are identified as at-risk for readmission and/or permanent placement outside their home have a multitude of individual and family needs affecting the child's ability to be successful. A recent study published by the Journal of the American Academy of Child and Adolescent Psychiatry supports this claim, concluding that "psychiatric rehospitalization of children is common, most likely in the trimester after discharge, and is highly related to both child symptoms and family factors measurable at admission" (Blader, Joseph. 2003). When treatment for these complex families is not comprehensive, children all too often require intensive and expensive interventions such as multiple hospitalizations, and possible involvement in the judicial or foster care system for long durations of time.

To assist these children and their families, a community provider must have an intensive and comprehensive program that can quickly establish stabilization, boundaries for safety and immediately begin addressing the multitude of needs. Furthermore, this program must provide 24-hr intervention; responding to crisis situations in attempt to avoid further hospitalizations and separation from family members. Currently, Metrocare Services does not have a community-based program that can offer this intensity of intervention. The implementation of a Family Preservation Model would allow Metrocare to provide intensive, community-based services that are proven to reduce costly out-of-home treatment episodes and addresses priority goals identified in the Region 9 Community Assessment Report.

5-Year Expected Outcome for Provider and Patients

- Baseline is Zero
- Increase client enrollment in program by 200 over baseline
- Increase client enrollment in program by 240 of over baseline
- Increase client enrollment in program by 280 of over baseline
- Decrease rate of readmission to psychiatric hospitals for those served

- Decrease rate of Juvenile Justice involvement for those served
- Decrease rate of out-of-home placement for those served

Starting Point/Baseline

Baseline for measures (clients served, number of encounters, and number of trained staff) is zero. Currently Metrocare does not offer any services through a Family Preservation Model.

Rationale

As described in the Region 9 Community Assessment (Section IV Behavioral Health), there are insufficient community based programs that provide crisis intervention and stabilization services to effectively and efficiently reduce the utilization of higher levels of care (i.e. ERs, hospitals, jails and detention facilities). Children and adolescents identified as having multiple needs and barriers are often readmitted to psychiatric facilities following stressful, chaotic and overwhelming triggers. Research shows that these children come from families that compartmentalize their multitude of problems and do not understand the connectedness and how these problems affect a child's ability to cope with stressors and remain safe in the home (Meezan, McCroskey, 1997). The consequence of multiple hospitalizations for this population is expensive treatment that is not determined to be effective. Family Preservation provides intensive, community-based services immediately following a hospital discharge; with the goal of establishing stability, safety and needs resolution to allow the child to avoid hospitalizations and remain in the home.

The Family Preservation Program would also serve those children and adolescent identified as "at-risk" for removal from the home due to chronic behavioral and/or familial issues that may result in out-of-home placement. Youth identified as "at-risk" by their current treatment provider (or relevant community stakeholder such as the school) would refer the child to Metrocare for a comprehensive assessment to determine appropriateness for services. Those youth determined to be in need of a multitude of services and at risk for out-of-home placement will be admitted into the Family Preservation Program.

Metrocare Services is the largest provider of mental health services in Dallas County. We serve approximately 10,000 people diagnosed with a mental illness each month. To provide quality services to such a large population, we must implement programs that are proven to be effective with our families. Further, as a member of this community, we recognize the societal and financial impact that multiple psychiatric hospitalizations, CPS and/or juvenile justice involvement, and child removal from home can have on a family and the greater community. FPP takes a comprehensive, systematic approach to treating families with complex needs, providing community based, intensive services to quickly establish stabilization and then work rigorously to assist the family with getting needs met to sustain safety and stabilization.

Through the efforts of this program, there will be a decrease in the number of children and adolescents readmitted to psychiatric hospitals, placed in Residential Treatment or involved in the juvenile justice system.

Project Components

This project has five required project components including:

A. Assess size, characteristics and needs of target population

B. Review literature/experience with populations similar to target population to determine community based interventions that are effective in averting negative outcomes

C. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes

D. Design models which include appropriate range of community-based services and residential supports

E. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis

Each of these required components are addressed in the Project Proposal by:

A. Conducting Needs Assessment

B. Conducting Needs Assessment and program design of interventions

C. Use of real time data for rapid cycle improvement for continuous Quality Improvement; use of standardized tools (Metrocare Clinical Data System and CANS) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning/quality of life

D. Conduct Needs Assessment and program design of interventions

E. Use of standardized tools (Metrocare Clinical Data System and CANS) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning/quality of life

The Child and Adolescent Needs and Strengths (CANS) Comprehensive is an information integration tool designed to support individual case planning, and the planning and evaluation of service systems. The CANS Comprehensive version for Texas is used in service delivery systems that address the mental health of children, adolescents and their families.

The Process Milestones chosen for this project were derived from the RHP Planning Protocol. A customized improvement milestone was created to evaluate the program's success at reducing out-of-home treatment episodes including stays at a psychiatric hospital, juvenile detention center or placement in a residential treatment facility. Metrocare chose to customize this improvement milestone because I-1 focuses only on admission/readmission to a criminal justice setting and would not capture the other facilities of focus. Milestone I-5, functional status, was not chosen as an improvement milestone because it would too closely measure a client's quality of life, which is Metrocare's identified Category 3 Improvement Target.

Unique community need identification numbers the project addresses

CN.5 Behavioral health
CN.6 Primary and behavioral care
CN.7 Behavioral health and jail population

How the project represents a significant enhancement to an existing delivery system reform initiative

This project will significantly enhance behavioral health services through recruitment of community health workers to serve patients with behavioral needs. Additionally, by reducing the utilization rates of out-of-home treatment facilities, Metrocare will aid our community partners by alleviating the number of youth seeking services and allowing those providers to focus on those clients in critical need for inpatient services.

Related Category 3 Outcome Measure(s)

IT-10.1 Quality of Life – as measured by the Child and Adolescent Needs and Strengths Assessment (CANS)

The goal of the Family Preservation Program is to provide intensive community based services to those youth who have experienced a psychiatric hospitalization or are at-risk for removal from home due to juvenile justice involvement or placement in a residential setting. Research indicates that adequate outpatient services decrease hospital use for behavioral health issues (SdosReis, et.al, 2008); however many children who experience multiple hospitalizations and those identified as at-risk for removal from home have a multitude of individual and family needs that negatively affect a child's quality of life and must be addressed for the child to stabilize in the community. Thus, intensive services that are comprehensive, offering multiple services to address unique needs of the family must be provided. The array of services provided through a Family Preservation Model are proven effective at reducing hospitalizations and out-of-home placements while costing considerably less than expensive treatment episodes in the hospital, juvenile justice system or residential treatment. These services will

include case management, skills training, counseling, psychiatric evaluation and medication management. Implementing this variety and intensity of services allows a holistic approach to treatment; examining all domains of a youth's life and can result in an improved quality of life. To evaluate the program's success regarding improving a child's quality of life, the Child and Adolescent Needs and Strengths Assessment will be used at admission and discharge.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance services along the continuum:

137252601.1.1
137252607.2.1
137252607.2.2
137250607.2.4
137250607.2.5

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

NA

Plan for Learning Collaboratives (if applicable)

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Metrocare Services determined the value of each project by comparing the budgeted cost of the specific project against the cost to the community should the services go unprovided. In regards to the FPP Project, the significant cost of hospitalization, emergency room visits, detainment in a juvenile facility and placement in a Residential Treatment Center were used as comparison data against cost for the community-based FPP Project. The starting point/baseline for the program is zero, with a total census of 200 youth served at the end of year three. The total census of those served will increase each year by 40 children. It is estimated that participation in FPP will result in less than 10% returning to the ER or hospital, less than 5% involved in the juvenile justice system and less than 2% placed in a Residential Treatment Center.

Project Option 2.13.1 – Intensive Applied Behavior Analysis Program (Center for Children with Autism)

Unique Project ID: 137252607.2.4
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/ 137252607

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: CCAM will provide an applied behavior analysis based program to children on the autism spectrum and/or children with other developmental disabilities. The program will structured as a tiered system; offering 1:1 staff/ client ratio for Level 1, 1:2 staff/ client ratio for Level 2 and group participation for Level 3.

Need for the project: The CDC reports that 1 in 88 children are diagnosed with an Autistic Spectrum Disorder. Additionally, the report indicated that the rate of autism increases 10-17% annually. Research studies have shown that children diagnosed with autism have the most likelihood of having successful outcomes when they receive early intensive behavioral intervention services. The Region 9 Community Needs Assessment highlights that "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our community. The implementation of an ABA based program will address the community needs outlined in our region's assessment by maintaining individuals in their homes while increasing relevant and effective services to those individuals and their caregivers. This model will decrease the time and cost associated with Special Education services, multiple emergency department visits and institutionalization.

Target population: CCAM will provide ABA based services to children on the autism spectrum and/or children with other developmental disabilities. The project estimates to serve 46 children in year 2, 64 children in year 3, 82 children in year 4, and 94 children in year 5. The target population will include, but is not solely, indigent clients and children insured by Medicaid. When applicable, CCAM will serve children insured by commercial insurance.

Category 1 or 2 expected benefits: The CCAM project will increase the number served in the program each year and increase the percentage of those served reporting improvement from enrollment to annual functional assessment utilizing the ABLLS standardized assessment.

Category 3 outcomes: The goal of CCAM is to:

- Reduce intensive school services and out-of-home treatment episodes
- Increase patient satisfaction scores related to timely care, appointments and information

Project Description

Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting (i.e., the criminal justice system, ER, urgent care etc.)

Scientific studies have shown that children diagnosed with autism have the most likelihood of having successful outcomes when they receive early intensive behavioral intervention services. These services should address learning, communication and social skills. Applied Behavior Analysis (ABA) arranges the environment to make behaviors more or less likely to occur in a socially significant setting. While there are many different types of ABA the basics and the way skills are taught are the same. ABA focuses on increasing behaviors, such as communication and social skills in order to decrease inappropriate behaviors. Currently, Applied Behavior Analysis is the most evidence-based treatment available for children with autism.

The Center for Children with Autism at Metrocare (CCAM) will offer quality Applied Behavior Analysis (ABA) services. The goal is to lead each child to his or her potential through evidence based therapy founded on the principles of ABA. The CCAM provides a hands-on approach with assessments, one-to-one therapy, and parent training to maximize progress.

CCAM will provide applied behavior analysis (ABA) to children on the autism spectrum and/or children with other developmental disabilities. The primary focus areas of the CCAM are communication, behavior management, and social skills. ABA techniques are utilized to teach new appropriate skills, such as communication, as well as, decrease inappropriate skills such as aggressive behavior. Each child's program is individualized to their needs, parent receive monthly parent training, and the program is supervised by licensed professionals, including a Board Certified Behavior Analyst. The program is based on a tiered system with levels from 1-3. Level one will be the most intensive and designated for those that are assessed to be the most severe. Level one offers 1:1 staff/client ratio, allowing the staff to give focused attention to the one child and provide immediate teaching and feedback. Children will progress to Level 2, where the ratio is 1:2 staff/client and allows the child to practice those skills learned thus far. Finally, the client will progress to Level 3, which is a group session offered 1 x week, allowing multiple children to interact with one another and refine the skills learned in the program. All therapy will be provided in a fun, creative and energetic environment to maximize a child's potential. The therapy center will be equipped with toys and therapeutic tools designed to help children on the autism spectrum learn.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

To lead each child to his or her potential through evidence based therapy founded on the principles of ABA. To provide behavioral services to increase self-reliance and improved functioning, thus decrease the need for costly and intensive special education services.

The Region 9 Community Needs Assessment highlights that "an inadequate supply of behavioral health services is one of the most significant unmet health needs" of our community (Collins, RHP 9 Community needs assessment report, 2012). In addition, "mental health services available to children are limited" and services "oftentimes do not include the family-focused and comprehensive approach needed to adequately address" client issues (Collins, 2012). The implementation of an Intensive Applied Behavior Analysis Program will address the community needs outlined in this assessment by maintaining individuals in their homes while increasing relevant and effective services to those individuals and their caregivers. This model will decrease the time and cost associated with Special Education services, multiple emergency department visits, and institutionalization.

Additionally, this project meets the regional goals of coordinating care for patients with behavioral needs

Challenges

Recent reports from the CDC suggest that 1 in 88 children are diagnosed with an Autistic Spectrum Disorder. Texas Council on Autism reported in its 2011 Annual Report that 1.5 million individuals in the United States were affected by Autism. Additionally the report indicated that the rate of autism increases 10-17% annually. The organization, Autism Speaks, estimates that autism costs society $137 billion per year. Autism is a pervasive developmental disorder (PDD) that involves severe deficits in a person's ability to communicate and interact with others. Children with autism often have trouble using their imagination, have a limited range of interests, and may show repetitive patterns of behavior or body movements. The disorder is often associated with some degree of mental retardation. Autism is the most prevalent PDD and the most common of all serious childhood disorders. Autism is four times more common in boys than in girls (1 in 54 boys are affected by Autism). More children will be diagnosed with autism this year than with AIDS, diabetes & cancer combined. There is currently no medical detection or cure for autism and the funding for research is limited when compared to other less prevalent childhood diseases.

5-Year Expected Outcome for Provider and Patients

- Recruit and train community health workers to serve in the program.

- Identify 46 at-risk children with developmental disabilities to enroll.
- Increase number of children with developmental disabilities served by team by 64 over baseline.
- Increase number of children with developmental disabilities served by team by 82 over baseline.
- Increase number of children with developmental disabilities served by team by 94 over baseline.

Starting Point/Baseline

Baseline for measures (clients served, number of encounters, and number of trained staff) is zero.

Rationale

Children diagnosed with an Autism Spectrum Disorder have multiple needs and face multiple barriers. Research shows that these children often benefit from and have the best future outcomes when they receive intensive ABA training. There are limited intensive services available in Region 9 for people with developmental disabilities displaying extreme behaviors. Metrocare offers a graduated system of care for people with developmental disabilities and behavioral health issues. This project completes the continuum of care where gaps currently exist.

Metrocare Services is the largest provider of mental health services in Dallas County. We serve approximately 1,000 people diagnosed with a developmental disability each month and 10,000 people diagnosed with a mental health disorder. To provide quality services to such a large population, we must implement programs that are proven to be effective with our families. Further, as a member of this community, we recognize the societal and financial impact that multiple psychiatric hospitalizations, CPS and/or juvenile justice involvement, and an individual's removal from home can have on a family and the greater community. The Intensive Applied Behavior Analysis Program will take a comprehensive, systematic approach to treating children with complex needs, providing intensive services to quickly establish a plan of care and then work rigorously to assist the individual/caregiver with getting needs met to daily functioning and improve quality of life. Through the efforts of this program, there will be a reduction in the need for costly and intensive Special Education services, and a future reduction in unnecessary Emergency Department visits or placement in a State Supported Living facility.

Project Components

This project has five required project components including:

A. Assess size, characteristics and needs of target population

B. Review literature/experience with populations similar to target population to determine community based interventions that are effective in averting negative outcomes

C. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes

D. Design models which include appropriate range of community-based services and residential supports

E. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis

Each of these required components are addressed in the Project Proposal by:

A. Program Design, as outlined in Manual of Operations, will include information regarding target population based on evidence and experience.

B. Program Design, as outlined in Manual of Operations, will be based on information derived from literature review and agency experiences with target population, to determine effective and relevant interventions and services to offer.

C. Use of real time data for rapid cycle improvement for continuous Quality Improvement; use of standardized tools (Metrocare Clinical Data System and the ABLLS) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning

D. Program Design, as outlined in Manual of Operations, will be based on information derived from literature review and agency experiences with target population, to determine effective and relevant interventions and services to offer.

E. Use of standardized tools (Metrocare Clinical Data System and the ABLLS) to determine decrease of out-of-home treatment episodes and increase in client functioning

The Assessment of Basic Language and Learning Skills - Revised (ABLLS®-R)

Developed by Dr. Partington, the ABLLS®-R system is an assessment tool, curriculum guide, and skills-tracking system used to help guide the instruction of language and critical learner skills for children with autism or other developmental disabilities. This practical and parent-friendly tool

can be used to facilitate the identification of skills needed by your child to effectively communicate and learn from everyday experiences.

Unique community need identification numbers the project addresses

CN.5: Behavioral Health
CN.6: Behavioral Health and Primary Care

How the project represents a significant enhancement to an existing delivery system reform initiative

This project will significantly enhance services for children with autism through teaching children new appropriate skills, such as communication, as well as, decrease inappropriate skills such as aggressive behavior. Each child's program is individualized to their needs, parent receive monthly parent training, and program are supervised by licensed professionals including a Board Certified Behavior Analyst. Therapy is provided in a fun, creative and energetic environment to maximize a child's potential.

Related Category 3 Outcome Measure(s)

IT-9.4: Other outcome target – Right Care, Right Setting -number of home-based clinical interventions over prior years

IT 6.1 Patient Satisfaction – timely care, appointments and information; prescriber communication with patients

The Category 3 Improvement Target regarding providing the right care in the right setting (9.4) and patient satisfaction (6.1) are the related outcomes to this project. Regarding providing the right care in the right setting, we project a decrease of intensive school services and out-of-home treatment episodes by 80% for those in service (Source: Metrocare clinical system). The goal of the Intensive Applied Behavior Analysis Program is to provide intensive services to children diagnosed with a developmental disability who have high levels of problems with communication, social skills, and behavior. These children are at risk for future high levels of costly and intensive special education services, utilization of emergency departments, and placement in residential facilities. Individuals diagnosed with a developmental disability can be a high cost to society and require intensive, specialized supports to prevent costly school services and institutionalization. There are long lasting consequences to this population if they do receive these specialized supports in order function on a daily basis. These consequences include inability to complete daily activities of living, inability to related to other socially, risk for physical/ emotional/ sexual abuse, deterioration of relationships with primary caregivers; and societal stigmatization due developmental disability. By evaluating patient satisfaction with services, Metrocare will assess progress towards the primary goal of this project which is to

expand access to behavioral health services to underserved areas in Dallas County. Further, the quality of patient/clinician communication, as perceived by the client, has been identified as a primary domain for determining satisfaction with services. Metrocare plans to use the Consumer Assessment of Healthcare Providers Survey (CAHPS) to measure patient satisfaction outcomes. Utilizing CAHPS will allow Metrocare to produce comparable data regarding the patient's perspective on care for the selected measures including timely care, appointments, information and prescriber communication with patients.

There is significant financial impact to the community and these improved outcomes are identified as priorities to our region. It is estimated that individuals with a diagnosis of Autism can cost society $137 billion dollars per year. Additionally, research shows that these children often benefit from and have the best future outcomes when they receive intensive ABA training. Thus, intensive services that are comprehensive, offering multiple services to address unique needs of the individual/caregiver must be provided. The services provided through an Intensive Applied Behavior Analysis Program are proven effective at improving daily functioning, communication skills, social skills, and reducing problematic behaviors. These services will include comprehensive functional assessment, skills training, family/caregiver training, and if needed psychiatric evaluation and medication management.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance services along the continuum:

137252601.1.1
137252607.2.1
137252607.2.2
137250607.2.3
137250607.2.5

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

NA

Plan for Learning Collaboratives (if applicable)

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Metrocare Services determined the value of each project by comparing the budgeted cost of the specific project against the cost to the community should the services go unprovided. In regards to the Intensive Applied Behavior Analysis program, the significant cost of Special Education services, emergency room visits, and placement in a State Supported Living Facility were used as comparison data against cost for the Intensive Applied Behavior Analysis program. The starting point/baseline for the program is zero, with a total census of 46 at the end of the year two. It is estimated that participation in CCAM will result in less than 10% requiring a high level of support through Special Education services and less than 2% requiring placement in a State Support Living Facility in the future.

Project Option 2.13.1 – Site Based Behavioral Day Program for Personal with Developmental Disabilities (Day Program)

Unique Project ID: 137252607.2.5
Performing Provider Name/TPI: Dallas County MHMR Center dba Metrocare Services/ 137252607

Provider: Metrocare Services is a behavioral health organization, serving approximately 50,000 persons in Dallas County with mental illness and developmental disabilities.

Interventions: The Behavioral Day Program will provide short-term behavior intervention and urgent safety net services for individuals with intellectual/developmental disabilities and mental health issues. The individuals will receive crisis diversion services and an intensive package of behavioral services to help stabilize them within their natural environment or if needed within a Respite Facility. While enrolled in the Behavioral Day Program, clients will receive three hours of treatment services per day, five times per week, resulting in 15 hours of services per week.

Need for the project: As described in the Region 9 Community Assessment, there are insufficient community based programs that provide crisis intervention and stabilization services to effectively and efficiently reduce the utilization of higher levels of care. The implementation of a site-based behavioral day program will address the community needs outline in the Region 9 Assessment by maintaining individuals in their homes while increasing relevant and effective services to those individuals and their caregivers. The model will decrease the time and cost associated with multiple hospitalization/emergency department visits, involvement with criminal justice system and institutionalization.

Target population: The target population includes indigent and Medicaid patients who are diagnosed with both a developmental disability and mental health disorder and who consistently demonstrate alarming behaviors that may result in hospitalization, arrest or placement in a residential facility. The program projects to serve up to 16 people in year 2, 24 people in year 3, 32 people in year 4 and 40 individuals in year 5.

Category 1 or 2 expected benefits: This project will increase the number of individuals served in the program each year (DY 2 – 15, DY 3 24, DY 4 -32, DY 5-40). This project will decrease patient utilization rates of out-of-home treatment facilities for those served in the BDP Program by 70% for DY 4 and 80% for DY 5.

Category 3 outcomes: The goal for this project is: improved Quality of Life IT-10.1

- DY 4 – 25% of those served will report improved quality of life/functional status. Data source: Archenbach System of Empirically Based Assessment (ASEBA)

- DY 5 - 50% of those served will report improved quality of life/functional status. Data source: Archenbach system of Empirically Based Assessment (ASEBA)

Project Description

Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting (i.e., the criminal justice system, ER, urgent care etc.)

Individuals with dual diagnoses (developmental disability and mental health issues) often require specialized support to prevent institutionalization and/or incarceration. The Behavioral Day Program (BDP) can provide short-term behavior intervention and urgent safety net services for individuals with intellectual and developmental disabilities. The program is designed to protect individuals from deteriorating mental health, injurious behaviors, incarceration, and institutionalization. The individual will receive crisis diversion services and an intensive package of behavioral services to help stabilize them within their natural environment or if needed within a Respite facility.

Individuals in the BDP program will be provided with a comprehensive support team that will help develop an intense individualized behavior treatment plan for the individual. This team includes the individual, LAR/guardian, Licensed Psychologist, Behavior Intervention Specialists, and MRA/Provider representative. Services will include implementation of the individualized behavior treatment plan, intensive parent/staff training, and transition to least restrictive long-term residential and/or day programming. Training focuses on reducing the challenging behaviors while increasing the socially appropriate behaviors. Training can include, but is not limited to, social skills, anger management, daily living skills, problem solving, conflict resolution, relaxation skills, symptom and medication management, pre-vocational skills, and healthy relationship skills.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

The goal is to decrease potential readmission to psychiatric facilities and to stabilize the individual within the home and community setting and to provide intensive behavioral services to increase individual, family, and community safety and to address needs that will keep the individual in the home and community.

The Region 9 Community Needs Assessment highlights that “an inadequate supply of behavioral health services is one of the most significant unmet health needs” of our community (Collins, RHP 9 Community needs assessment report, 2012). The implementation of a Site-

based behavioral day program will address the community needs outlined in this assessment by maintaining individuals in their homes while increasing relevant and effective services to those individuals and their caregivers. This model will decrease the time and cost associated with multiple hospitalization/emergency department visits, involvement with criminal justice system and institutionalization.

Additionally, this project meets the regional goal of coordinated care for patients with behavioral health needs.

Challenges

According to the Texas Council for Developmental Disabilities (TCDD), approximately 475,265 people in the state of Texas are diagnosed with a Development Disability. An APA task force estimated that 30-70 percent of persons diagnosed with a developmental disability will experience the effects of a mental health condition at some point in their lifetime. In a 2009 study published in the American Association on Intellectual and Developmental Disabilities, it was estimated that 4-10% of individuals incarcerated also have a developmental disability. Once incarcerated, these individuals rarely receive specialized services, are at higher risk for victimization by other inmates, and may have more difficulty following rules resulting in longer sentences and lower likelihood of parole. Additionally, once released, this population receives little to no services increasing the rate of recidivism.

The Texas Department of Aging and Disability Services (DADS) operates 13 state supported living centers in the state of Texas. These state supported living centers provide 24-hour residential services to approximately 4,070 individuals with intellectual and developmental disabilities who are medically fragile or who have behavioral problems. These faculties have long faced overcrowding and funding cuts, resulting in returning consumers to the community without the skills needed to be successful.

5-Year Expected Outcome for Provider and Patients

- Recruit and train community health workers to serve in the treatment center
- Identify 16 at-risk people with developmental disabilities and enroll with site-based program.
- Increase number of people with developmental disabilities served by site based program by 24 over baseline.
- Increase number of people with developmental disabilities served by site based program by 32 over baseline.
- Increase number of people with developmental disabilities served by site based program by 40 over baseline.

Starting Point/Baseline

Baseline for measures (clients served, number of encounters, and number of trained staff) is zero. Hiring, training of staff and enrollment of the initial 16 clients will occur in DY 2. Program census will increase each year by 8.

Rationale

As described in the Region 9 Community Assessment (Section IV Behavioral Health), there are insufficient community based programs that provide crisis intervention and stabilization services to effectively and efficiently reduce the utilization of higher levels of care (i.e. ERs, hospitals, correctional facilities, and State Support Living Facilities). A site-based behavioral day treatment program for clients with developmental disabilities will allow Metrocare to utilize its specially trained staff to assist in crisis situations and provide the ongoing services needed to avoid crisis in the future. This approach to treatment fosters treatment team approach with a focus on building adaptive skills and resolving client needs to ensure stabilization in the home.

Metrocare Services is the largest provider of mental health services in Dallas County. We serve approximately 1,000 people diagnosed with a developmental disability each month and 10,000 people diagnosed with a mental health disorder. To provide quality services to such a large population, we must implement programs that are proven to be effective with our families. Further, as a member of this community, we recognize the societal and financial impact that multiple psychiatric hospitalizations, CPS and/or juvenile justice involvement, and an individual's removal from home can have on a family and the greater community. The Site-Based Day Program will take a comprehensive, systematic approach to treating individuals with complex needs, providing intensive services to quickly establish stabilization and then work rigorously to assist the individual/caregiver with getting needs met to sustain safety and stabilization. Through the efforts of this program, there will be a decrease in the number of individuals readmitted to psychiatric hospitals, involved in the criminal justice system, or placed in State Supported Living facility.

Project Components

This project has five required project components including:

A. Assess size, characteristics and needs of target population

B. Review literature/experience with populations similar to target population to determine community based interventions that are effective in averting negative outcomes

C. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes

D. Design models which include appropriate range of community-based services and residential supports

E. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis

Each of these required components are addressed in the Project Proposal by:

A. Program Design, as outlined in Manual of Operations, will include information regarding target population based on evidence and experience.

B. Program Design, as outlined in Manual of Operations, will be based on information derived from literature review and agency experiences with target population, to determine effective and relevant interventions and services to offer through Day Program.

C. Use of real time data for rapid cycle improvement for continuous Quality Improvement; use of standardized tools (Metrocare Clinical Data System and the Achenbach) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning/quality of life

D. Program Design, as outlined in Manual of Operations, will be based on information derived from literature review and agency experiences with target population, to determine effective and relevant interventions and services to offer through Day Program.

E. Use of standardized tools (Metrocare Clinical Data System and the Achenbach) to determine decrease of out-of-home treatment episodes and increase in community-based services and client functioning/quality of life.

The ADEBA Approach: The Archenbach System of Empirically Based Assessment (ASEBA) offers a comprehensive approach to assessing adaptive and maladaptive functioning. Developed through decades of research and practical experience to identify actual patterns of functioning, the ASEBA provides professionals with user-friendly tools. The ASEVA assesses competencies, adaptive functioning, and behavioral, emotional, and social problems from age 1 ½ to over 90. Numerous studies demonstrate significant associations between ASEBA scores and both diagnostic and special education categories. You can relate ASEBA directly to DSM-IV diagnostic categories by using the DSM-oriented scales for scoring ASEBA forms.

The Process Milestones chosen for the project were derived from the RHP Planning Protocol. A customized improvement milestone was created to evaluate the programs' success at reducing

out-of-home treatment episodes including stays at psychiatric hospitals, criminal justice centers or placement in residential treatment facilities. Metrocare chose to customize this improvement milestone because I-1 focuses only on admission/readmission to a criminal justice setting and would not capture the other facilities of focus. Milestone I-5, functional status, was not chosen as an improvement milestone because it would too closely measure a client's quality of life, which is Metrocare's identified Category 3 Improvement Target.

Unique community need identification numbers the project addresses

CN.5: Behavioral Health

How the project represents a significant enhancement to an existing delivery system reform initiative

This program will establish a special day program for individuals with behavioral needs. It will provide individuals in the BDP program a comprehensive support team that will help develop an intense individualized behavior treatment plan for the individual that will assist in reducing the challenging behaviors while increasing the socially appropriate behaviors. Training can include, but is not limited to, social skills, anger management, daily living skills, problem solving, conflict resolution, relaxation skills, symptom and medication management, pre-vocational skills, and healthy relationship skills. Additionally, by reducing the utilization rates of out-of-home treatment facilities, Metrocare will aid our community partners by alleviating the number of patients seeking services and allowing those providers to focus on those clients in critical need of inpatient type services, incarceration or residential treatment.

Related Category 3 Outcome Measure(s)

IT-10.1 quality of Life – as measured by the Archenbach System of Empirically Based Assessment (ASEBA)

The goal of the Site-based Day Program is to provide intensive services to those individual diagnosed with a developmental disability that have experienced a psychiatric hospitalization, interaction with the criminal justice system, high rates of emergency department utilization, or are at-risk for placement in a State Supported Living facility. Some individuals diagnosed with a developmental disability and mental illness require specialized supports to prevent institutionalization or incarceration. There are long lasting consequences to this population if they do not receive these specialized supports in order to function on a daily basis. These consequences can include inability to complete daily activities of living, physical/emotional/sexual abuse, deterioration of relationships with primary caregivers; and stigmatization due to involvement with the criminal justice system.

Research indicates that adequate outpatient services decrease hospital use for behavioral health issues; however many individuals who experience multiple hospitalizations and are

identified as at-risk for removal from home have a multitude of individual and caregiver needs that must be addressed for the individual to stabilize in the community. Thus, intensive services that are comprehensive, offering multiple services to address unique needs of the individual/caregiver must be provided. The services provided through an intensive behavioral program are proven effective at improving daily functioning, reducing hospitalizations and out-of-home placements while costing considerably less than expensive treatment episodes in the hospital, criminal justice system or residential treatment. These services will include comprehensive functional assessment, skills training, counseling, family/caregiver training, and if needed, psychiatric evaluation and medication management. Implementing this variety and intensity of services allows a holistic approach to treatment; teaching the clients life skills and coping strategies that allows them to remain in their homes, stabilized with an increased quality of life. To evaluate the program's success regarding improving a client's quality of life, the ASEBA will be used to assess progress from admission to discharge.

Relationship to Other Projects

This project is one element of the behavioral health services continuum of care and relates to all other projects that provide/enhance services along the continuum:

137252601.1.1
137252607.2.1
137252607.2.2
137250607.2.3
137250607.2.4

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

NA

Plan for Learning Collaboratives (if applicable)

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Metrocare Services determined the value of each project by comparing the budgeted cost of the specific project against the cost to the community should the services go unprovided. In regards to the site-based Behavioral Day program, the significant cost of hospitalization, emergency room visits, detainment in a correctional facility, and placement in a State

Supported Living Facility were used as comparison data against cost for the Behavioral Day program. The starting point/baseline for the program is zero, with a total census of 16 at the end of the first year. The total census of those served will increase each year by 8 individuals. It is estimated that participation in BDP will result in less than 10% returning to the ER or hospital, less than 5% involved with the criminal justice system, and less than 2% requiring placement in a State Support Living Facility in the future.

Project Option 2.2.1: Denton County Diabetes Registry and Expanded Chronic Care Management among Low Income Diabetic Registry Patients

Unique Project ID: 136360803.2.1
Performing Provider Name/TPI: Denton County Health & Human Services/136360803

Summary Description

Denton County Health Department is a County funded program with a wide range of programs serving about 40,000 patients a year. Services include immunization, well child, prenatal care and primary care. There are two office locations and 4 providers with bilingual nursing and clerical support.

Intervention

The project will implement a chronic disease registry to track Medicaid and low income diabetic patients. This will facilitate a comprehensive listing of Medicaid and low income diabetes patients in Denton County. In addition, diabetes care will be provided incorporating the Chronic Care Model developed by Wagner. In this way diabetes clients will be contacted twice a month to encourage taking medications in accordance with physician's orders, keeping appointments, proper diets, exercise, and other self-management techniques to improve health outcomes.

Need for Project

Under the traditional care model, health outcomes for many diabetes patients are poor, at best. Too many are non-compliant with physician's orders. Too many fail to make and keep referral appointments for eye care and foot care. Too many experience serious consequences as result of their non-compliance. The Chronic Care Model will improve the likelihood of improved outcomes for those clients that will strive for self- management.

Target Population

The target population is diabetics who are low income or Medicaid recipients. There are an estimated 5,000 in Denton County.

Expected Benefit

The project will provide Chronic Care Model case management to 200 diabetic clients in DY3, DY4, and DY5.

Category 3 Outcomes

Our goal is to reduce the percentage of registry patients with poorly controlled HbA1c by 5% by the end of DY5.

Project Description

This project will identify Denton County low income residents who are diagnosed with diabetes. These individuals will be entered into a diabetes registry that will provide a

cumulative list of individual name, address, and contact information as well as basic health care identifying information. A consolidated list will be maintained at two Denton County Health Department (DCHD) locations, the Denton Clinic, and the Lewisville Clinic. The list will be comprised of individuals who have been diagnosed with diabetes and who are either Medicaid recipients, or those who have no insurance. This project will also implement and monitor improvements in diabetic care and clinical outcomes among low income Denton County residents especially emphasizing the role of self-management, which will be facilitated by case managers and behavioral coaches, working in conjunction with the more traditional providers.

It is expected that DCHD will enroll about 200 participants in the first year. Part of the challenge for this project will be to make other providers who see low income families aware of the project and invite them to consent to have their clients participate. Multiple strategies will be employed to accomplish this task, including making visits to hospitals and to physician groups to inform them of the project and to discuss the merits of a county-wide diabetes registry.

However, the initiation of a diabetes registry is only a small part of this project. By far, the greater challenge is incorporating the components of a health system transformation into the standard provision of health care for diabetics. The need for health system transformation in the area of diabetes care is tragically evident in the office of every family practice physician. Diabetes patients do not follow their physicians' orders. They do not take their medications as ordered. They do not receive the specialty foot care that they need, although referrals are made. They do not lose weight, as their physicians order. And they do not test their blood sugar as their physicians order. Health care plans don't work in patients who do not follow them.

This project proposes to transform the traditional plan of care with a team approach, incorporating many of the components of the Chronic Care Model developed by Wagner. This approach will especially emphasize the role of self-management, which will be facilitated by case managers and behavioral coaches, working in conjunction with the more traditional providers. Rather than a monthly or quarterly physician office visit, the transformational approach will supplement the office visit with email contact, phone calls and home visits by the case management team on a bi-weekly basis.

In this way, the substantial benefits of self-management can be optimized, as the case management team provides bi-weekly encouragement for patients to follow their doctor's orders and make the difficult lifestyle changes that are so essential to improving their health outcomes. In addition to their bi-weekly one on one client contacts, the case management team will encourage participation in periodic diabetes group education and support meetings. In this way, patients can also benefit from the experiences of other motivated patients to grow in their desire and ability to self-manage. They will still keep all physician visits and remain committed to follow doctor's orders, but the entire approach becomes much more collaborative in nature, taking full advantage of the medical skills of the physician. But also incorporating the ability of the case management team to motivate the patient, educate the

patient, and in the process, help to greatly improve the compliance of the patient. This collaborative approach has shown great promise in the improvement of chronic disease outcomes.

Goals and Relationship to Regional Goals

The goal of this project is to implement the Chronic Care model among low income diabetes patients in Denton County. This project will implement and monitor improvements in diabetic care and clinical outcomes among low income Denton County residents especially emphasizing the role of self-management, which will be facilitated by case managers and behavioral coaches, working in conjunction with the more traditional providers. The goal is to substantially improve the clients' ability to self-manage their condition. This will result in improvements in key indicators such as blood pressure and HbA1c levels. Furthermore, with the routine contact and encouragement provided by the case management team, other important factors such as keeping specialty appointments for foot and eye care will also show improvement. These improved health status indicators will likely translate into reduced health care expenditures.

RHP 9 regional goals include improved access to care, improved care coordination and management and improved performance and outcomes. This project meets the regional goals of improved quality of care by improving care management and coordination for chronic conditions.

Challenges

Several major challenges are expected. The most formidable is the reality that diabetic patients are notoriously non-compliant. Their tendency is not to do the things that their physicians order. This is especially true while they are feeling good. Although the disease process may be doing severe damage to their bodies, they feel ok for the time being, and choose not to make the lifestyle changes that are necessary to effectively combat the disease. This attitude will be the focus of the health care team that works with this project. The chronic disease model that employs a broader range of health professionals, with considerably more patient contact, has a better chance to overcome this challenge.

5-year Expected Outcome for Provider and Patients

The outcome of this project is the development and implementation of a registry and multi-disciplinary care team approach based on the Chronic Care Model to effectively and successfully manage the chronic conditions of low income diabetic patients, ultimately improving clinical indicators and health outcomes for these patients. It is anticipated that through the use of the Chronic Care model, low income diabetic clients will improve their ability to participate in their care and grow in their capacity for self-management. Important indicators such as HbA1c levels will be expected to improve substantially as the case

management teams interact with clients on a regular basis and encourage therapeutic compliance. In addition referrals to specialists for foot care and/or eye care will be kept on a more consistent basis and as a result of these interventions; health care expenditures will be decreased although health status will be improved.

The ability to demonstrate improved diabetes health outcomes through the use of the Chronic Care teams in Denton County will be a significant development in terms of the management of diabetes in low income Denton County residents. It will document the usefulness of the team approach and the importance of providing sustained encouragement and case management to clients whose conditions demand substantial lifestyle changes. It is expected that the outcomes will result in improved self-management skills, improved health status, and reduced health care expenditures.

Starting Point/Baseline

There are an estimated 60,000 diabetics in Denton County. Over 5,000 would clearly fall within the low income population that is the target of this project. The number is probably even larger since minority families have an even higher prevalence rate for diabetes. But a conservative estimate of the target population for this project is well over 5,000 low income individuals with diabetes. The identification of a diabetes management team to help diabetic patients grow in their ability to self-manage their condition would be a significant development in diabetes care for non-compliant patients, and a substantial means of reducing the long term costs associated with diabetes. The components of this project are to: establish low income Denton County Diabetes Registry, expand chronic care model to primary care clinics, identify and manage registry patients, enroll registry patients in chronic care programs, and to ultimately improve clinical outcomes. Baseline starting point is 10/1/2012-9/30/2013.

Rationale

There are over 25.8 million people in America or 8.3% of the population that have diabetes in 2010 (National Diabetes Fact sheet, 2011). Diabetes is a risk factor for heart disease and if not controlled through insulin therapy can lead to death. The prevention of diabetes is within the Affordable Care Act of 2010 and the monitoring of diabetes in America is defined in the Catalyst to Better Diabetes Care Act of 2009, which is in the Affordable Care Act. The CDC reports that 67% of those that have diabetes also have high blood pressure and are at risk of vision loss, kidney failure, and amputations of legs or feet. The cost of diabetic care in 2007 according to the CDC was 174 billion dollars with 116 billion due to direct medical costs and 58 billion due to indirect medical costs. The prevalence of adult diabetes cases has increased from 1980 to 2010 in America. There are preventive care practices for those that are diagnosed with diabetes, such as flu vaccination, attendance to a diabetes self-care management class, checking HbA1c levels at least twice a year, annual eye exams, annual foot exams and daily monitoring of glucose. A survey of adults usage of these preventive care practices indicate 50 percent receive a flu vaccine, 58 percent attend a self-management class, 69 percent check HbA1c levels, 68 percent get an annual foot exam, 64 percent of adults check daily glucose and 63 percent get an annual eye exam. Many diabetic patients are noncompliant with preventive care practices (Diabetes

report Card, 2012). Disease and case management are effective in increasing preventive diabetic care. Disease management was developed to reduce the short term and long term health complications of chronic diseases like diabetes. Disease management identifies the population with diabetes, establishes standards of care for the disease, manages those that have disease, and monitors the progress of the disease. Case management is part of disease management and encourages those with the disease to follow the standards of care. According to the CDC Guide to Community Preventive services both disease management and case management improve HBA1c control, screening for diabetic retinopathy, screening for foot lesions, and screening for peripheral neuropathy (The Effectiveness of Disease and Case Management for People with Diabetes, 2002).[309][310][311]

Project Components

Core components for Project 2.2.1 include:

a) Design and implement care teams that are tailored to the patient's health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system
b) Ensure that patients can access their care teams in person or by phone or email
c) Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources
d) Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project ot a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

CN.9 Chronic Disease Management

How project represents a a new initiative

This is a new project designed to improve chronic disease management among the Denton County low-income diabetic population.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.10 "HbA1c poor control" will be used as the project outcome measure.

Reasons/Rationale for selecting outcome measures

Poorly controlled blood glucose levels may cause life-threatening and/or life-ending complications. This measure facilitates the prevention and long-term management of high blood sugar levels for patients with diabetes. Effective management of this clinical indicator will reduce co-morbid complications and contribute to improved disease management. Therefore, it was selected as the Category 3 Outcome measure for assessment.

Relationship to Other Projects

There are no similar projects submitted by Denton County

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborates

RHP 9 projects related to chronic care management include the projects listed below:

Performing Provider	Unique Project	Project Option
Baylor University Medical Center	139485012.2.2	Expand Chronic Care Management Model – Diabetes (HbA1c poor control, BP control, foot exam)
Baylor Medical Center at Garland	121790303.2.2

Texas Health Presbyterian Hospital Kaufman	094140302.2.2	
UTSW – Faculty Practice Plan	126686802.2.2	Expand Chronic Care Management Model (Diabetes: HbA1c; All Cause Readmissions)

Denton County will participate in learning collaboratives as appropriate.

Project Valuation

Denton County Health Department has proposed to implement the chronic care model as a means of improving patients' ability to manage their diabetes. In doing so, health outcomes will be improved, and at the same time the costs associated with their care will be substantially reduced. The most reliable diabetes data are from 2007, when a total cost of $174 billion was assigned to an estimated 25.8 million diabetics. (National Diabetes Fact Sheet, 2011) That computes to an average of $6,744 per diabetic. But those are 2007 dollars. The present project period begins in 2013 and goes to 2017. A more accurate cost per patient could be estimated at $10,000, based upon an ever increasing cost of medical care. But this estimate is for all US diabetics, most of whom have health insurance and adequate access to care.

The Denton County Health Department project addresses only Medicaid and uninsured diabetics. This specific group of clients has substantially less access to health care; they are notoriously non-compliant; and they frequently utilize hospital emergency departments in lieu of primary care providers. Their health care costs might be estimated at 2 or even 3 times higher than the average diabetic. If Medicaid and uninsured patients are estimated at double the average cost for the project period, then a cost of $20,000 per diabetic might be a reasonable projected cost.

Using this projection, the estimated costs of care for the 600 diabetic patients that are included in this proposal would be 600 x $20,000 which equates to $12,000,000. If use of the chronic care model results in improved self-management, better patient compliance and improved health outcomes, a reduction in per person health care costs might be 50%. The resultant savings would amount to $6,000,000 which is $1 million more than the cost of the project. So the project might pay for itself, save an addition million in health care costs, and provide a model for care to Medicaid and uninsured diabetics that might result in far more substantial savings and improved health outcomes.

Project Option 2.7.6 – Disease Prevention Program: Denton County Immunization Project

Unique Project ID: 136360803.2.2
Performing Provider Name/TPI: Denton County Health & Human Services/136360803

Summary Description

Denton County Health Department is a County funded program with a wide range of programs serving about 40,000 patients a year. Services include immunization, well child, prenatal care and primary care. There are two office locations and 4 providers with bilingual nursing and clerical support.

Interventions

This project will promote and provide preventive immunizations to adult Medicaid and adult low income individuals in Denton County. The immunizations will include meningitis, shingles, pneumonia, influenza, hepatitis A, hepatitis B, pertussis, tetanus, and measles, mumps, and rubella.

Need for Project

State funding reductions have eliminated the availability of these vaccines to adults. But even when the vaccines were available, adults were never the target of any preventive program. They might be served, if the vaccines were available, but they were not the target population from a health promotion perspective. Children were always the primary focus. Between 2005 and 2010 there were 5,895 hospitalizations in Denton County just for bacterial pneumonia. Expanded use of vaccine can prevent many of these hospitalizations.

Target Population

The target population is adult low income and adult Medicaid recipients who may be at risk for the diseases which the vaccines prevent.

Expected Benefits

The project will administer preventive vaccines to 200 low income and Medicaid adults during DY3, DY4, and DY5.

Category 3 Outcomes

Our goal is to reduce the percentage of clinic clients hospitalized by pneumonia or influenza by 5% by the end of DY5.

Project Description

This project proposes to target low income adult Denton County Health Clinic clients with vaccines that will help them stay healthy, stay on the job, and prevent disease and hospitalization.

Every year vaccine preventable diseases in adults account for millions of dollars in health care expenditures. Between 2005 and 2010, there were 5,895 hospital admissions in Denton County for bacterial pneumonia. The cumulative cost of just these hospital admissions was over $230 million dollars. Pneumonia vaccine can prevent a large percentage of these hospitalizations which collectively cost essentially $486 for every adult in Denton County. Expanded use of adult immunizations can prevent disease and substantially reduce health care costs. Another very obvious need for expanded immunization, especially among adults, is in the area of influenza. Influenza and pneumonia combined are the sixth highest cause of death in Denton County. Many of these cases are among individuals who are over 50 years of age and are known to be at increased risk. Nevertheless, immunity levels among this population remain in the area of 50% and consequently, too many Denton County residents become statistics that testify to the need for a vigorous adult immunization program.

In previous years the Texas Department of State Health Services provided many adult vaccines to local health departments. Legislative funding cuts from a year ago have eliminated the provision of adult vaccines to local health departments. The vaccination of adults, like the vaccination of children, produces predictable outcomes that are well documented. Increased vaccination results in increased levels of immunity and reduced morbidity and mortality. A clearly associated secondary outcome is reduced health care expenditures.

This project proposes to target low income adult Denton County Health Clinic clients with vaccines that will help them stay healthy, stay on the job, and prevent disease and hospitalization. The specific vaccines to be administered include: meningitis, shingles, pneumonia, influenza, hepatitis A, hepatitis B, pertussis, tetanus, and measles, mumps, and rubella. Provision of these vaccines, especially to the low income families of Denton County is a highly cost effective proposition. Families that are struggling to put food on the table, and who must postpone a trip to town because gasoline prices are too high are not likely to incur the costs associated with these vaccines. The costs are prohibitive for those struggling to get by. The ability for public health to provide these vaccines to individuals who would not otherwise receive them is central to the mission of public health. It is perfectly preventive in nature, and will help to protect the vaccine recipients, as well as the community in general. In the process, thousands of dollars in health care expenditures can be avoided.

This project proposes to target low income Denton County adults with vaccines that will help them stay healthy, stay on the job, and prevent disease and hospitalization. The specific vaccines to be administered include: meningitis, shingles, pneumonia, influenza, hepatitis A, hepatitis B, pertussis, tetanus, and measles, mumps, and rubella. Provision of these vaccines, especially to the low income families of Denton County is a highly cost effective proposition. Families that are struggling to put food on the table, and who must postpone a trip to town because gasoline prices are too high are not likely to incur the costs associated with these vaccines. The costs are prohibitive for those struggling to get by. The ability for public health to provide these vaccines to individuals who would not otherwise receive them is central to the mission of public health. It is perfectly preventive in nature, and will help to protect the vaccine

recipients, as well as the community in general. These vaccinations will reduce the burden of disease and in the process, thousands of dollars in health care expenditures can be avoided.

This project plans to use a team of 5 individuals, a project manager, 2 LVNs and 2 clerical support staff. The majority of the vaccines will be administered at the two Denton County Health Department clinic locations, one in Denton and one in Lewisville. Occasionally, off site clinics may be arranged to meet special community needs. During the project period, it is expected that over 12,000 individuals will be vaccinated.

Goals and Relationship to Regional Goals

The goal of this project is to target low income Denton County adults with vaccines that will help them stay healthy, stay on the job, and prevent disease and hospitalization. The specific vaccines to be administered include: meningitis, shingles, pneumonia, influenza, hepatitis A, hepatitis B, pertussis, tetanus, and measles, mumps, and rubella. Provision of these vaccines, especially to the low income families of Denton County is a highly cost effective proposition. This project will create a vaccination team, establish outreach, and increase awareness to maximize voluntary immunizations among low income populations in Denton County, Texas. The most immediate goal of the project is to administer 12,000 doses of vaccines to low income Denton County families. In doing so, cases of disease will be prevented. Hospitalizations will be avoided; and substantial savings in health care expenditures may be experienced.

This project meets the regional goals of improved care coordination and management through primary and preventive care and reduced hospitalizations by ensuring low income Denton County residents are immunized.

Challenges

Motivating individuals to obtain preventive vaccines is the major challenge. Preventive strategies are not traditionally embraced by low income populations. Understandably, how to provide supper for the family takes precedence over how to prevent a disease that may not occur for several years, if at all. Thus convincing low income families of the importance of preventive immunizations will be a substantial challenge. The ability to integrate vaccine administration with other health visits may provide a helpful approach. And certainly making the vaccines available at a very low cost will help as well.

5-Year Expected Outcome for Provider and Patients

The outcome of this project is to increase the proportion of low income Denton County adults with vaccines that will help them stay healthy, stay on the job, and prevent disease and hospitalization, thereby, reducing hospitalizations for the combined flu and pneumonia rates among this population. This DSRIP goal is to reduce overall hospitalizations for the combined flu

and pneumonia rates by 5% overall by year 5. This outcome will demonstrate the ability to focus services on a particular at risk population and bring about improved health outcomes within a few short years. The cost effectiveness of vaccines is well documented. The ability to expand the model to adults and demonstrate reductions in hospitalization rates in areas such as bacterial pneumonia and influenza can be particularly helpful in formulating health policy.

Starting Point/Baseline

Establish and implement immunization team. At present, no baseline exists; however, as the project begins to serve clients, immunity levels will be recorded for the various vaccine categories so that comparisons can be made in subsequent years. Baseline starting point is 10/1/2012-9/30/2013.

Rationale

Immunization or vaccination is a large success story in public health. An organization called Healthy People sets national goals every ten years for the improvement of health in America. The organization has a 2020 goal for increasing vaccinations of multiple diseases such as meningitis, shingles, pneumonia, influenza, hepatitis A, hepatitis B, pertussis, tetanus, measles, mumps, and rubella (Healthy people 2020 objectives, 2012). The vaccination of children by routine immunization schedules saves 33,000 lives, prevents 14 million cases of disease, reduces direct health care costs by $9.9 billion, and saves $33.4 billion in indirect costs according to the Healthy People organization. The vaccination success story has not eliminated these diseases because there are over 30,000 deaths and 400,000 cases of illness in the United States that could be prevented with community programs according to the CDC. The CDC has a Guide to Community Preventive services that have three categories of interventions for increasing vaccination in a community, which are increasing community demand for vaccination, enhancing access to vaccination services, and provider-based interventions. The community demand can be increased by reminding clients on vaccinations through calls, email or regular mail, requiring vaccination in daycare, schools and college attendance, and community education. The access to vaccination services can increase by reducing out-of-pocket costs for vaccinations, expanding access to vaccinations in health care facilities, and more vaccination opportunities in non-medical settings. The provider can increase vaccination by reminding patients on vaccinations during provider visits, standing orders for vaccination by providers and increased provider education on vaccines (Reviews of Evidence Regarding Interventions to Improve Vaccination Coverage in Children, Adolescents, and Adults, 2000).[312][313][314]

[312] Ndiaye SM, Hopkins DP, Shefer AM, Hinman AR, Briss PA, Rodewald LE, Willis B, Task Force on Community Preventive Services. Interventions to improve influenza, pneumococcal polysaccharide, and hepatitis B vaccinations coverage among high-risk adults: a systematic review. American Journal of Prevention Medicine. 2005. Vol 28 No 5S, pp 248-279.

[313] Briss PA, Rodewald LE, Hinman AR, Shefer AM, Strikas RA, Bernier RR, Carandes-Kulis VG, Yusuf HR, Ndiaye SM, Williams SM, Task force on Community Preventive Services. Reviews of evidence regarding interventions to improve vaccination coverage in children, adolescents and adults. American Journal of Prevention Medicine. 2003. Vol 18 No 1S, pp 97-140.

An important vaccination that is used at a national level is for influenza, which has caused 114,000 excess hospitalizations and 36,000 deaths according to the CDC. There is an increase in mortality for patients older than 65 and those that have chronic disease because of complications with influenza. In 2000, the influenza vaccination coverage for adults with high-risk conditions was 33%, which was below the Healthy People 2010 goal of 60% (Interventions to Improve Influenza, Pneumococcal Polysaccharide, and Hepatitis B Vaccination Coverage among High-Risk Adults, 2005). This new community program reinstates the adult safety-net vaccination program that was eliminated in early 2011. The Texas Department of State Health Services discontinued the purchase of vaccine for local health departments based on budget cuts and a newly-interpreted rule from the Centers for Disease Control regarding the use of the Vaccine for Children (VFC) vaccine supply program. Under the new interpretation, underinsured and uninsured adults were no longer covered. The result of this rule change was the discontinuation of low/no-cost immunization programs for adults who needed them most.

Project Components

The core requirements of Project Option 2.7.6 "Other Projects" Option: Denton County Immunization Project includes the following:

a) Design and implement Immunization teams to administer vaccines to target populations.
b) Ensure that target population can access immunization center teams in person or by phone or email.
c) Increase target population participation through education, community alliances, contact with area providers, announcements, and community events.
d) Implement projects to generate target population awareness of the necessity to be vaccinated.
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project or a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Expanded use of adult immunizations can prevent disease and substantially reduce health care costs by reducing hospitalizations. The health impact of flu and pneumonia is substantial. Vaccines are the most effective way to prevent severe illness and complications. Every year vaccine preventable diseases in adults account for millions of dollars in health care expenditures. Between 2005 and 2010, there were 5,895 hospital admissions in Denton County for bacterial pneumonia. The cumulative cost of just these hospital admissions was over $230

[314] Healthy people 2020 summary of objectives: Immunization and Infectious Diseases. Available at: http://healthypeople.gov/2020/topicsobjectives2020/pdfs/Immunization.pdf. Accessed October 12, 2012

million dollars. Pneumonia vaccine can prevent a large percentage of these hospitalizations which collectively cost essentially $486 for every adult in Denton County. The components of this project are to: develop an immunization program for low income adult clinic clients, participate in learning engagements with other similar providers, identify low income clinic clients in need of vaccination, provide vaccinations, and ultimately to reduce admission rates among clinic clients for vaccine preventable diseases such as pneumonia and influenza.

Unique community need identification numbers the project addresses

CN.4 Primary Care

How the project represents a significant enhancement to an existing delivery system reform initiative

This is a new project designed to improve immunization levels among the Denton County low-income diabetic population

Related Category 3 Outcome Measure(s)

IT-2.10: Flu and pneumonia Admission Rate will be used as the project outcome measure.

Reasons/Rationale for selecting outcome measures

Expanded use of adult immunizations can prevent disease and substantially reduce health care costs by reducing hospitalizations. The health impact of flu and pneumonia is substantial; therefore, hospital admission rates for pneumonia or influenza was selected as the Category 3 Outcome Measure for assessment.

Relationship to Other Projects

There are no related projects for Denton County.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborates

As this is a specific initiative for Denton County residents, there are no other similar or related RHP 9 projects being submitted.

Denton County will participate in learning collaboratives as appropriate.

Project Valuation

Denton County has proposed to improve health outcomes for Medicaid and uninsured residents by expanding adult immunizations. The rationale for the use of vaccines to reduce health care costs is perhaps the best success story in public health. The cost reduction in the treatment of smallpox is quite dramatic. Similarly, health care expenditures for polio have been

all but eliminated as a direct result of the use of vaccines. DCHD outcomes for influenza and bacterial pneumonia immunization may not be quite as spectacular, but they are predictable and substantial.

Texas Department of State Health Services documents confirm 5,895 hospitalizations from 2005 to 2010 for bacterial pneumonia. The total hospital charges that resulted from these admissions was $233,417,472, an average of $39,596 per hospitalization. The DCHD proposal includes the vaccination of 1500 Medicaid recipients and uninsured residents for bacterial pneumonia. If these immunizations result in the prevention of 100 hospitalizations, the associated savings would be $3,959,600.

Similarly, influenza hospitalization costs would also reduced. Although influenza costs for hospitalization are not as great, there are more of them. A conservative cost estimate is $10,000 per influenza admission. Consequently, if the provision of 1500 doses of vaccine were to result in 100 fewer hospitalizations, the resultant savings would be about $1,000,000. Keep in mind the 1500 vaccinations would mean 1500 fewer individuals to spread influenza to other susceptibles, so 100 fewer hospitalizations is not a stretch.

These are only the hospitalization costs and do not take into consideration the costs related to health care providers, labs, pharmacy, etc. Furthermore, this is only two of the proposed 10 vaccines. These two vaccines alone could result in hospitalization savings of 4.9 million. Additional savings realized from pertussis, hepatitis A, hepatitis B, Zoster, and the other vaccines would surely result in savings of at least $1,000,000. That would bring the hospitalization savings to 5.9 million and another million could be anticipated in provider, laboratory, and pharmacy savings. So the total estimated savings would exceed 6.9 million from a program that costs only 5 million. Given the documented cost effectiveness of vaccine programs, this initiative to improve adult immunizations among Medicaid recipients and the uninsured is clearly cost effective.

Project Option 2.8.6 - 24 Hour Psychiatric Triage Facility

Unique Provider ID: 135234606.2.1
Performing Provider Name/TPI: Denton County MHMR Center/135234606

Provider: Denton County MHMR Center is a state-funded not for profit outpatient mental health clinic serving as the mental health authority for Denton County. Denton County covers 952.98 square miles, has population of 662, 614, and has a rate of growth of 58% over the last 10 years . Denton County does not have an acute-care safety net hospital.

Interventions: This project will implement a 24-hour psychiatric triage facility to provide 24 hour care to individuals in crisis to decrease inappropriate ED usage.

Need for the Project: Denton County does not have an acute-care safety net hospital. The project will relieve the burden of treating psychiatric clients in the emergency room setting.

Target Population: Our target population is any individual experiencing a psychiatric crisis that does not require medical attention. Approximately 90% of our current clients are indigent or Medicaid eligible and we estimate that 60-75% of the clients of the psychiatric triage facility will also be indigent or Medicaid eligible. We intend to serve at a minimum 500 individuals in the psych triage facility by the end of DY 5.

Category 2 Expected Patient Benefit: Our goal is to increase efficiency of client care and decrease cost by streamlining care for individuals in a psychiatric crisis. The client will experience a decrease in wait time for assessment, and a decreased involvement from law enforcement in their care. These things will be of great benefit to the clients. The patient benefit includes serving at a minimum 500 individuals at the facility by the end of DY 5 and providing an average of 2.5 services per individual.

Category 3 Outcomes: IT 9.2- Our goal is to reduce inappropriate ED usage for behavioral health target population by 15% over baseline during DY 4 and 30 % in DY 5.

Project Description

Establish a 24 hour psychiatric triage facility to increase the capacity to provide psychiatric services, to better accommodate the high demand for triage services, and reduce inappropriate emergency room usage.

Goals and Relationship to Regional Goals

The project goal is the development of a 24 hour psychiatric triage facility that will link individuals in need of psychiatric services with appropriate care. Regional goals are to increase access to necessary behavioral health services.

Challenges

The challenges for this project include: lack of funding, lack of a public hospital, lack of voluntary and involuntary beds at state mental health facilities, lack of insurance for 17.2% of adults and 10.6% of children for individuals in Denton County, and lack of additional community resources to promote preventative behavioral health services [CN.5]. The county lacks community resources for behavioral health care assessment/services for indigent individuals outside of the Local Mental Health Authority.

The challenges will be overcome by establishing a 24 hour triage facility to serve individuals in psychiatric crisis. The facility will give people 24 hour access to psychiatric care outside of the hospital setting to reduce cost and reduce the demand on inpatient beds and Emergency Department (ED) space. The triage facility will provide quality and efficient access to care for patients who currently have to wait and go through several providers to access appropriate treatment. The starting point for the expansion and enhancement of behavioral health services will be developing 24 hour psychiatric triage services. Services include: assessment, medication management and referral, as indicated, to a higher level of care. The four year expected outcome of the project is to provide expanded behavioral health triage services through a centralized location, thus reducing potentially preventable admissions/readmissions to area hospitals and emergency rooms.

5-year Expected Outcome for Providers and Patients

Reduced inappropriate ED usage for targeted population - Behavioral Health/Substance Abuse

Starting Point/Baseline

In Denton County, those that are uninsured or underinsured have limited access to mental health services [CN.5]. The starting point for the expansion and enhancement of behavioral health services will be developing 24 hour psychiatric triage services. Services include assessment, medication management and referral, as indicated, to a higher level of care. The four year expected outcome of the project is to provide expanded behavioral health triage services through a centralized location, thus reducing potentially preventable admissions/readmissions to area hospitals and emergency departments. Denton County has the least amount of mental health funding per capita in the State of Texas. The emergency rooms, law enforcement, and the criminal justice system have an increased burden due to this lack of funding and resources. Current access to emergency crisis services is available by calling the access/crisis line. An intake may be scheduled or a mobile crisis team may go out to the community or emergency rooms for an emergency crisis screening. Approximately one third of these crisis screenings are done in the emergency rooms or in hospitals. Denton County does not have a public acute-care safety net hospital. Due to the lack of indigent mental health care

availability, there is a need for increased capacity for triage of psychiatric emergencies with the emphasis of preventing inappropriate emergency room use and linking individuals with appropriate care. Denton County MHMR Center will determine an appropriate baseline in DY3 of the project.

Rationale

The 24 Hour Psychiatric Triage Facility is a new initiative for Denton County MHMR Center. The rationale for the project is in the value of reducing Emergency Department (ED) admit/readmit rates and prevention of unnecessary ED, acute care, and criminal justice use [6]. This project will address the metrics associated with Right Care and Right Setting as required under 2.8.6 in the RHP planning protocol. This initiative will also enhance the opportunity for additional jail diversion [6, CN.7]. The community need for this project is due to lack of funding, lack of a public acute-care safety net hospital, lack of voluntary and involuntary beds at state mental health facilities, and lack of additional community resources to promote preventative behavioral health services [CN.5]. The county lacks community resources for behavioral health care assessment/services for indigent individuals outside of the Local Mental Health Authority. The United Way of Denton County, Inc. identified health needs and mental health services for depression as top findings in their assessment [CN.5]. The lack of health care access is attributed to a lack of insurance (2011: 17.2% adults and 10.6% children [CN.5]. The project will benefit local EDs by redirecting indiviudals without medical needs, but with psychiatric needs to our facility. In addition, it will cut down the amount of time law enforcement spends at residences and other community locations handling psychiatric crisis situations. The client will benefit because he/she will not experience the wait time he/she may experience currently at an ED when he/she is in psychiatric crisis. When individuals that have a mental health diagnosis receive treatment and are able to return to work the value to the community is increased by wages and taxable income [8, 4, 10]. Individuals that have a mental health diagnosis earn $16,000 dollars less annually than their non-diagnoses counterpart. This costs employers in the United States and other countries, including Australia, billions of dollars in lost revenue generation, and loss of labor force. Millions of dollars are also lost in income tax revenue. The Texas economy loses $5 billion annually due to mental illness mostly through loss of worker production [6, 11, 9, 13]. Effective community triage, referrals, and community treatment can reduce emergency room admission and readmission, acute care, as well as decreasing lost revenue and increased expenditure on avoidable incarceration. The cost of care for a person that has a mental illness is as follows: Incarceration $137 per day, ER $1265, state mental health hospital $400 per day; verses community cost of care for a person that has a mental illness: $12.00 per day. Appropriate triage can prevent incarceration, ER visits, acute care utilizations, and state hospital admits by appropriate referrals to the community mental health system [5]. Moreover, in an Integrated Care Collaboration model study, it was noted that nine frequent ER users over six years cost three million dollars to treat, seven of those nine had a mental illness [1, 2, 3, 4, 7, 12].

Project Components

There are no project components for Project Option 2.8.6

Unique community need identification numbers the project addresses

Community needs are addressed throughout the document.
CN 5 Behavioral Health
CN7 Behavioral Health and Jail Population

How the project represents a new initiative

The community does not currently have a 24-hour psychiatric triage service and this project will fulfill that need for care.

Related Category 3 Outcome Measure(s)

- IT-9.2: Reduce inappropriate ED usage for targeted population-Behavioral Health/Substance Abuse

Providing a psychiatric triage facility will lead to appropriate care for individuals with behavioral health and substance abuse emergencies that do not require medical attention. Often individuals seek treatment in EDs because they do not have other places to seek treatment or do not know where to seek treatment. The priority stems from a lack of resources in this county for low income health care services as evidenced by Denton County MHMR Center's growing

wait list for services and the high numbers of people seeking treatment for psychiatric services in emergency departments. Denton County MHMR Center's waiting list for behavioral health services is over 300 as of October 2012. Currently, Denton County has no public hospital and limited resources for indigent care [CN.5].

Relationship to other Project

- 2.8.3: Reduce potentially preventable admissions
- 2.8.4: Reduce potentially preventable readmissions

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Related projects to improve access to behavioral health services in appropriate settings include:

Dallas County HHS	121758005.1.1: Behavioral Health Crisis Stabilization Services
Lakes Regional MHMR	121988304.1.1: Behavioral Health Crisis Stabilization Services

As appropriate, we plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The value of this project includes reducing ED admit/readmit rates and prevention of unnecessary ED, acute care, and criminal justice use [6]. This initiative will also enhance the opportunity for additional jail diversion [6]. When individuals that have a mental health diagnosis receive treatment and are able to return to work the value to the community is increased by wages and taxable income [8, 4, 10]. Individuals that have a mental health diagnosis earn $16,000 dollars less than their non-diagnosed counterpart annually. This costs employers in the United States and other countries, including Australia, billions of dollars in lost revenue generation, and loss of labor force. Millions of dollars are also lost in income tax revenue. The Texas economy loses $5 billion annually due to mental illness mostly through loss of worker production [6, 11, 9, 13]. Effective community triage, referrals, and community treatment can reduce emergency room admission and readmission, acute care, as well as decreasing lost revenue and increased expenditure on avoidable incarceration. The cost of care for a person that has a mental illness is as follows: Incarceration $137 per day, ER $1265, state mental health hospital $400 per day, and community cost of care for a person that has a mental illness: $12.00 per day. Appropriate triage can prevent incarceration, ER visits, acute care utilizations, and State Hospital admits by appropriate referrals to the community mental health system [5]. Moreover, in an Integrated Care Collaboration model study, it was noted that nine frequent ER users over six years cost three million dollars to treat and seven of those nine had a mental illness [1, 2, 3, 4, 7, 12]. In addition, through econometrics, we value the impact of this project to the community at $30,000,000, although Denton County MHMR Center is requesting a much smaller DSRIP valuation/incentive payment for this project.

Project Option 2.15.1 - Integrated Primary and Behavioral Health

Unique Project ID: 135234606.2.2
Performing Provider Name/TPI: Denton County MHMR Center/135234606

Provider: Denton County MHMR Center is a state-funded not for profit outpatient mental health clinic serving as the mental health authority for Denton County. Denton County covers 952.98 square miles, has population of 662, 614, and has a rate of growth of 58% over the last 10 years . Denton County does not have an acute-care safety net hospital.

Interventions: This project will implement an integration of care management functions for individuals with co-morbid chronic diseases, mental illnesses, and/or substance use disorders by collaborative partnership agreements for delivery of primary and behavioral health care management.

Need for the Project: Denton County does not have an acute-care safety net hospital. Denton County MHMR Center has an extensive waiting list. The project is needed to decrease the waiting list, increase access to health care, and decrease emergency department costs.

Target Population: Our target population is individuals experiencing co-morbid behavioral health and primary health concerns. Approximately 90% of our current clients are indigent or Medicaid eligible. We estimate 95-100% of our integrated clinic clients will be Medicaid eligible or indigent. We intend to serve at a minimum 200 individuals in our integrated clinic by the end of DY 5.

Category 2 Expected Patient Benefit: The project benefits the patient by improving access to health care for individuals by helping providing both primary and behavioral health care. The individual will experience optimal health through access to preventative care. The indigent individual will be able to have his/her needs met in one location decreasing his/her need for excessive appointments requiring often unattainable transportation. The benefit to the individual includes seeing at least 200 individuals by the end of DY 5 with an average of 3 services per month per individual.

Category 3 Outcomes: IT 6.1- Our goal is to increase patient satisfaction scores by 50% over baseline in DY 4 and 75 % DY 5.

Project Description

Design, implement, and evaluate projects that provide integrated primary and behavioral health care services.

Goals and Relationship to Regional Goals

The goal for the project includes the integration of care management functions for individuals with co-morbid chronic diseases, mental illness, and/or substance use disorders, by collaborative partnership agreements for delivery of primary and behavioral health care management. This project will meet the goals of the region related to the need to coordinate primary and behavioral health services.

Challenges

The challenges and issues of the performing provider include: limited funding opportunities for expansion, extensive waitlist of behavioral health services, currently over-serving Department of State Health Services (DSHS) funding capacity to fulfill the needs for behavioral health services (adults 113%, children and adolescents 197%), lack of community resources for provision of primary care and co-morbid chronic diseases.

The implementation of this project will reduce the extensive wait list for Denton County MHMR Center (over 300 clients as of October 2012), provide access health care for uninsured and underinsured clients, and reduce Emergency Department (ED) costs by providing improved access. In addition, Denton County does not have a public acute-care safety net hospital. According to 2011 census, Denton County has a poverty level of 8.9%. According to 2011 United Way of Denton County, Inc. needs assessment, 17.2% of adults and 10.6% of children in Denton County are uninsured [CN.5, CN.6].

5-Year Expected Outcome for Provider and Patients

The intended outcome is to improve patient satisfaction for patients who would benefit from integration of primary and behavioral health services and reduce inappropriate ED usage.

Starting Point/Baseline

In Denton County, those that are uninsured, underinsured, or have Medicaid, have limited access to primary care providers and behavioral health providers. These populations often have multiple concomitant issues such as substance use; traumatic injuries; homelessness, cognitive challenges; lack of daily living skills and lack of natural supports. The starting point will be to open a primary/behavioral health clinic two days a week providing services to a target of greater than 12 clients per day. The four year expected outcome of the project is to provide expanded hours of operation and access to primary and behavioral health services for a minimum of 200 individuals. The state's mental health system provides rehabilitative services and pharmacotherapy to people with certain severe mental diagnoses and functional limitations, but can serve only a fraction of the medically indigent population; the system does not serve other high risk behavioral health populations and does not provide the range of

services needed to deal with complex mental and physical needs. These individuals consistently use the emergency rooms for routine or non-emergent health care needs. Indigent health care is limited in Denton County with few resources and no public hospital system [CN.6]. Without access to preventative care, chronic medical and behavioral health needs go untreated and result in increased costs to the individual and the community [5, 6, 11].

Rationale

The Integrated Primary and Behavioral Health facility is a new initiative for Denton County MHMR Center. The rationale for the project is the value to the community, public health system, criminal justice system, and hospitals by reducing inappropriate emergency room admissions, readmissions, and inappropriate use of the criminal justice system. The project will address core components A, B, C, D, E, F, G, H, I, and J of 2.15.1 of the RHP planning protocol. If integrated and primary behavioral health care access is not available, the indigent population is often forced to turn to expensive sites of care such as EDs and urgent care. The United Way of Denton County, Inc. Needs Assessment further identified affordable and accessible health care and preventative health care as needs in Denton County [CN.6]. Research has shown that integrated health care can save billions yearly, by avoiding emergency room visits and incarceration. An example of cost savings is utilizing community based care at the average of $12 per day, compared with the cost of $1256 for a limited emergency room visit. According to the National Association of Community Mental Health Centers Inc. as cited in an article [6], 35% of emergency room visits are avoidable if access to primary care exists, leading to savings of $18 billion per year. This study cites Texas as one of four states that spends over $1 billion annually in ED visits [6]. A different example of the cost effectiveness of integrated health care includes a pilot integrated health care system in Colorado, where a $2040 savings per year per patient occurred. A total of 200 served over five years equal $408,000 saved over regular care [3]. In a project report [2], it is listed that the effect of an integrated intervention is equivalent to an increase of 0.338 quality-adjusted life-years. Twenty individuals served x 0.338 x $50,000 (life year value) = $338,000 savings. Collaborative care models have shown savings of $1.7 for every dollar invested. Integrated primary and behavioral health care has shown improved quality of care, cost effectiveness, and decreases the disparities in health care [1, 3, 6, 7, 8, 9, 10, 11]. In addition, through econometrics, we value the impact of this project to the community at $15,000,000, although Denton County MHMR Center is requesting a much smaller DSRIP valuation/incentive payment for this project.

Project Components

The required core components for Project 2.15.1 - Design, implement, and evaluate projects that provide integrated primary and behavioral health care services include:

a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. Examples of selection criteria could include proximity/accessibility to target population, physical plant conducive to provider

interaction; ability / willingness to integrate and share data electronically; receptivity to integrated team approach.

b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated.
c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers
d) Recruit a number of specialty providers (physical health, mental health, substance abuse, etc. to provide services in the specified locations.
e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:
    - Regular consultative meetings between physical health and behavioral health practitioners;
    - Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or
    - Shared treatment plans co-developed by both physical health and behavioral health practitioners
f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in a health information exchange – depending on the size and scope of the local project.
g) Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice.
h) Arrange for utilities and building services for these settings
i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.
j) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

How the project represents a new initiative

This is a new initiative for Denton County MHMR Center

Related Category 3 Outcome Measures

- IT-6.1 Percent over baseline improvement of patient satisfaction scores

Integrated health care patient satisfaction will lead to improved health through easier access to routine health care. Integrated health and preventative care also leads to greater participation and adherence to treatment and prevention recommendations. The priority stems from a lack of resources in this county for low income health care services as evidenced by Denton County MHMR Center's growing wait list for services. Denton County MHMR Center's waiting list for behavioral health services is over 300 as of October 2012. Currently, Denton County has no public hospital and limited resources for indigent care. The individual will experience optimal health through access to preventative care. The indigent individual will be able to have his/her needs met in one location decreasing his/her need for excessive apointments requiring expensive often unattainable transportation. Individuals without insurance often seek services at emergency rooms due to being unable to access services elsewhere. Having this clinic would decrease the need for individuals to seek treatment for preventative care in the EDs. When individuals are more satisfied with services, they are more likely to participate to the fullest extent, leading to a greater likelihood of success.

Relationship to other Projects

Other projects related ot improving behavioral health services include:

135234606.2.1	Establish 24-hour triage
135234606.2.3	Crisis residential center

Related Category 4 Population-focused improvements

RD-4: Patient-centered Care

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Other performing providers with related projects include:

HCA Medical City Dallas Hospital:	020943901.2.1
Dallas County MHMR dba MetroCare:	137252607.2.1

As appropriate, we plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The value for the project to the community, public health system, criminal justice system, and hospitals is reducing inappropriate emergency room admissions, readmissions, and inappropriate use of the criminal justice system. If integrated and primary behavioral health care access is not available, the indigent population is often forced to turn to expensive sites of care such as EDs and urgent care.

Research shows that integrated health care can save billions yearly, by avoiding emergency room visits and incarceration. The cost of care for a person that has a mental illness is as follows: Incarceration $137 per day, ER $1265 per visit, state mental health hospital $400 per day; verses community cost of care for a person that has a mental illness is $12 per day. According to the National Association of Community Mental Health Centers Inc. as cited in article [6], 35% of emergency room visits are avoidable if access to primary care exists, leading to savings of $18 billion a year. This study cites Texas as one of four states that spends over $1 billion annually in ED visits [6]. A different example of the cost effectiveness of integrated health care includes a pilot integrated health care system in Colorado, where a $2040 saving per year per patient occurred. A total of 200 served over five years equal $408,000 saved over regular care [3]. In a project report, it is listed that the effect of an integrated intervention is equivalent to an increase of 0.338 quality-adjusted life-years [2]. Twenty individuals served x 0.338 x $50,000 (life year value) = $338,000 savings. Collaborative care models have shown savings of $1.7 for every dollar invested. Integrated primary and behavioral health care has shown to improve the quality of care, cost effectiveness, and decreases the disparities in health care [1, 3, 4, 6, 7, 8, 9, 10, 11, 12].

Project Option 2.13.1 - Crisis Residential Care

Unique Project ID: 135234606.2.3
Performing Provider Name/TPI: Denton County MHMR Center/135234606

Provider: Denton County MHMR Center is a state-funded not for profit outpatient mental health clinic serving as the mental health authority for Denton County. Denton County covers 952.98 square miles ,has population of 662, 614, and has a rate of growth of 58% over the last 10 years . Denton County does not have an acute-care safety net hospital.

Interventions: This project will implement a crisis residential care program to provide interventions for a targeted population to prevent unnecessary use of services in specific settings.

Need for the Project: Denton County has limited resources for housing and shelter. Our Section 8 housing program has an extensive waiting list and is currently closed. Denton County does not have an acute-care safety net hospital. This project will help individuals who do not have adequate shelter to not inappropriately access hospitals and the criminal justice systems.

Target Population: Our target population is individuals with a severe mental illness and other factors leading to extended or repeated psychiatric inpatient stays. Factors could include chronic physical health conditions, chronic or intermittent homelessness, cognitive issues, resulting from severe mental illness and/or forensic involvement. Approximately 90% of our current clients are indigent or Medicaid eligible and we estimate that 95-100% of our residential facility clients will be indigent or Medicaid eligible. We intend to serve individuals with at a minimum 2,000 residential bed days at the residential facility by the end of DY 5.

Category 2 Expected Patient Benefit: The benefit to the client is improved functional status for individuals in the program as measured by standardized instruments. By the end of DY 5, this project plans to provide a minimum of 2,000 residential bed days to individuals in psychiatric crisis. We anticipate the volume of services to be a minimum of 2 per bed day.

Category 3 Outcomes: IT 6.1- Our goal is to increase patient satisfaction scores by 50% over baseline in DY 4 and 75% in DY 5.

Project Description
Establish a crisis residential care program to provide an intervention for a target behavioral health population to prevent unnecessary use of services in a specified setting. Increase the capacity to provide crisis residential services to better accommodate the high demand for crisis residential services and reduce potentially preventable admissions and readmissions to hospitals and jails.

Goals and Relationship to Regional Goals

The goal for this project is to reduce the demand for inappropriate admissions (i.e., the criminal justice system, ER, urgent care) and assist the individual in maintaining residence in the community. The community need for the project is due to readmissions for inpatient care. This project will meet the goals of the region by decreasing inappropriate inpatient admissions and incarcerations.

Challenges

The challenges and issues of the performing provider include funding for project, lack of community resources for crisis residential services, and the lack of a public acute-care safety net hospital in Denton County. According to the 2011 United Way Needs Survey, emergency shelter and transitional housing needs have continued to rise in Denton County [CN.5, CN.7]. The Section 8 Denton Housing Authority (DHA) list closed in June of 2011. The DHA currently has a waitlist of 2,700 individuals; the estimated wait for assistance is four years.

The starting point would be the development of a crisis residential home with a capacity of 8 individuals with additional beds for additional needs, such as individuals with substance abuse disorders, transition from criminal justice system, and transition from a higher level of need. The four year expected outcome of the project is to provide short-term community based residential crisis treatment for individuals in Denton County.

5-Year Expected Outcome for Provider and Patients

The combination of these services will reduce behavioral and medical emergency room admission and readmission as well as decrease lost revenue and decrease avoidable incarceration.

Starting Point/Baseline

In Denton County, those that are uninsured or underinsured have limited access to shelter and stabilization services. Denton County has the least amount of mental health funding per capita in the state of Texas. The emergency rooms, law enforcement, and the criminal justice system have an increased burden due to this lack of funding and resources. Current access to emergency crisis services is available by calling the access/crisis line. Denton County does not have an acute-care safety net hospital. In addition, Denton County lacks resources for homeless individuals. The starting point of this project is to set up a residential facility to treat individuals with behavioral health diagnoses to keep them from potentially admitting and/or readmitting into the hospital. Our four year outcome is to expand on our initial project to serve more individuals in our residential facility.

Rationale

The Crisis Residental project is a new initiative for Denton County MHMR Center. The goal of this project is to improve outcomes and promote access to quality behavioral health care services on a regular basis. The project will include the core components A, B, C, D, and E of 2.13.1 in the RHP planning protocol.

The project has been identified as a need in Denton County in the 2011 United Way Needs Assessment Survey [10]. Emergency shelter and transitional housing have been included in the top four needs in the income section of this community needs assessment [10, 11, CN.5]. Individuals that have a mental health diagnosis and are in need of housing services often turn to the emergency rooms as first line treatment for their mental illness and housing needs. This treatment center will provide emergency and transitional housing and shelter using the Department of State Health Services crisis residential staffing guidelines. Qualified mental health professionals will be available. The combination of these services will reduce behavioral and medical emergency room admission and readmission, as well as decrease lost revenue and increase expenditure on avoidable incarceration. Acute treatment costs were 44% lower in a crisis residential program ($3046 per episode) as compared to hospitalization ($5,549 per episode) and the typical cost for homeless individuals is $2,897 per month [1]. Typical cost of housing for residents in supportive housing is $605 per month. This is a savings of $2,292 a month for one individual [2, 3, 4, 5, 6, 7, 8, 9]. In addition, through econometrics, we value the impact of this project to the community at $15,000,000 although Denton County MHMR is requesting a smaller DSRIP valuation/incentive payment for this project.

Project Components

The require core components of Project 2.13.1 - Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population include:

a. Assess size, characteristics and needs of target population(s) (e.g., people with severe mental illness and other factors leading to extended or repeated psychiatric inpatient stays. Factors could include chronic physical health conditions; chronic or intermittent homelessness, cognitive issues resulting from severe mental illness and/or forensic involvement.
b. Review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life.

c. Develop project evaluation plan using qualitative/quantitative metrics to determine outcomes
d. Design models which include an appropriate range of community-based services and residential supports.
e. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population. Examples of data sources include: standardized assessments of functional, mental and health status (such as the ANSA and SF 36); medical, prescription drug and claims/encounter records; participant surveys; provider surveys. Identify "lessons learned," opportunities to scale all or part of the intervention(s) to a broader patient populations, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations

Reasons/Rational for selecting outcome measures

Satisfaction surveys measure the perception of services rendered. Crisis residential patient satisfaction will lead to improved health by decreasing inpatient stays and leading client to improved success in community settings. The priority stems from a lack of resources in this county for residential services for clients with behavioral health and substance abuse disorders.

Specify unique community need identification numbers the project addresses

- CN5 Behavioral Health
- CN7 Behavioral Health and Jail Population

How the project represents a new initiative

This project is a new initiative to establish a crisis residential care program which Denton County currently does not have available for the needs of this targeted population.

Related Category 3 Outcome Measures

IT-6.1 Percent over baseline improvement of patient satisfaction scores

Satisfaction surveys measure the perception of services rendered. Crisis residential patient satisfaction will lead to improved health by decreasing inpatient stays and leading client to improved success in community settings. The priority stems from a lack of resources in this county for residential services for clients with behavioral health and substance abuse disorders. When an individual is satisfied with the services he/she is receiving, the chances of successfully completing the program are greater. Succcess in the crisis residential program can help

individuals avoid jail, EDs, and long term homelessness. The program is designed to allow indiviudals to be in the county with which they are familiar to receive treatment.

Relationship to other Projects

Other projects related to improving behavioral health services include:

135234606.2.1	Establish 24-hour triage
135234606.2.2	Integrate primary and behavioral health services

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

NA (What other Performing Provider Projects address preventable admissions/readmissions and reduced incarcerations?)

As appropriate, we plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The value of this project is to improve outcomes and promote access to quality behavioral health care services on a regular basis. The project has been identified as a need in Denton County in the United Way Needs Assessment Survey [10, CN.5]. Emergency shelter and transitional housing have been included in the top four needs in the income section of this community needs assessment [10, 11, CN.5]. Individuals that have a mental health diagnosis and are in need of housing services often turn to the emergency rooms as first line treatment for their mental illness and housing needs. The crisis residential treatment center will provide emergency and transitional housing and shelter utilizing Department of Social and Health Services crisis residential staffing guidelines. Qualified mental health professionals will be available. The combination of these services will reduce behavioral and medical emergency room admission and readmission, as well as decrease lost revenue and increase expenditure on avoidable incarceration. Acute treatment costs were 44% lower in a crisis residential program ($3046 per episode) as compared to hospitalization ($5,549 per episode) and the typical cost for homeless persons is $2,897 per month [1]. The typical cost of housing for residents in supportive housing is $605 per month. This is a savings of $2,292 a month for one individual [2, 3, 4, 5, 6, 7, 8, 9].

Project Option 2.8.11 - Implement an Innovative and Evidence Based Intervention that will lead to reduction in Sepsis Complications (Apply Process Improvement Methodology to Improve Quality/Efficiency)

Unique Project ID: 111905902.2.1
Performing Provider Name/TPI: Denton Regional Medical Center/111905902

Provider: Denton Regional Medical Center is a 179-bed acute care hospital in Denton County, Texas serving a primary and secondary service population of approximately 430,000.

Intervention(s): This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. Interventions will include implementing houseiwde 12/hour screenings on all patients, ED protocols, ICU Sepsis evidence based care treatment protocols and developing a measurement and reporitng system.

Need for the project: The current diagnosis and treatment of sepsis is not adequate for patient safety and quality of care with mortality as high as 60%. Complications from lack of timely and appropriate treatment of sepsis including lifetime health issues, disability and mortality put an unnecessary burden on society and the healthcare system. Process improvement methodologies will facilitate analysis of the evidence based program and implementation of corrective actions to improve implementation and maximize outcomes.

Target population: The target population for diagnosing sepsis arepatients presenting to ED and all patients in house. . By initiating housewide screening every 12 hours on patients , we believe the number of patients diagnosed will increase. Once diagnosed with sepsis hock, severe sepsis, evidence based treatment is necessary Approximately 28% of patients to be screened are Medicaid and indigent. It is estimated currently 23% of our patients treated for sepsis are Medicaid eligible or indigent. Based on current processes over 275 patients will be treated over course of the waiver, however with improvement in diagnosis a key element of the program, this number is expected to increase to estimated 530 patients over 5 years (DY1-55,DY2-83,DY3-103,DY-129,DY5-160) Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

Category 1 or 2 expected patient benefits: The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence based care with improved the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with severe sepsis and septic shock. We expect to diagnose and treat 530 sepsis patients (estimated at DY 1- 55, DY2-83, DY 3- 103, DY 4- 129, DY 5-160). 55 patients were diagnosed in DY 1 with the implementation of the sepsis program. However only 38 patients were properly treated with

the evidence based care plan from the program. In addition it is estimated based on similar size hospitals with sepsis programs, we should expect to diagnosis 159 patients a year. Potentially we are not properly diagnosing 104 patients a year. Patients that may not diagnosed/diagnosed timely or not receive evidence based treatment may have resulted in death or disability. The program will have great benefit to patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.

Category 3 Outcomes:
IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis from 30% currently to 20% by DY5. The estimated DY 1 mortality was 31% and improvement of 25% by DY 5, morality would be 23%.
IT -4.9 Our goal is the reduce the Average length of stay of patients with sepsis by 10% in DY 4 and 15 % in DY 5. Estimated DY 1 ALOS was 10.1 , a reduction goal by DY 5 of 2 days to ALOS of 8.10.

Project Description
The project will design and implement a **Process Improvement** plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles to improve patient outcomes.

Denton Regional Medical Center is committed to continuous quality improvement so all of our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for Emergency Department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes, revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient that screens positive for severe sepsis or septic shock and is hypotensive.

Denton Regional Medical Center will also track primary endpoints of mortality and ICU LOS. Process and other measures will be tracked that include, percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous renal replacement therapy.

Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of Sepsis Resuscitations and Management Bundles still remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Goals and Relationship to Regional Goals:

The goal of this project is to implement a Process Improvement plan to improve safety and quality for those patients with Sepsis. We will:

1. Achieve 90% Compliance with the Sepsis Resuscitation and Management Bundles in patients admitted to the ICU.
2. Substantially improve early sepsis identification, reduce sepsis related Mortality by 25% from baseline.
3. Effective and fully implemented measurement and reporting system supporting compliance with the Sepsis Resuscitation and Management Bundles.
4. Continue to work with Emergency Medical Services to improve the delivery of care provided to patients with suspected infection.
5. Improve identification of sepsis patients' house wide by implementing nursing admission screening and shift assessments for sepsis screening.
6. Improve identification of sepsis, compliance from TBD with current Sepsis Resuscitation and Management Bundles in the Emergency Department.

This project supports the regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of post hospital care in addition to quality-adjusted life gained.

Challenges

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe

sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the contributing factors contributing to the design of evidenced based standardized care sets and subsequent adoption of those tools will aid greatly to reducing variation and associated cost. Early recognition and management of sepsis results in lives saved.

5-Year Expected Outcome for Provider and Patients

We expect to reach 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate>4mmol/L (36mg/dl). We also expect to be 90% compliance with application of the Sepsis Bundles for patients that meet specified criteria.

Starting Point/Baseline

The number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would be 159 per year for a total of 530 patient over course of the waiver (DY1-55,DY2-83, DY3-103, DY4-129, DY5-160). The hospital only diagnosed 55 patients in DY 1. Of those patients diagnosed only 38 received evidenced based care for sepsis bundles. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012. Early data collection indicates compliance with sepsis bundles is a low as 50%. It is expected that the morality rate for this population in DY 2 will initially increase compared to DY 1 due to more patients being correctly diagnosed with new sepsis protocols thus a baseline will be established in DY2 to measure same mortality based on same standards of care. The same is true for average length of stay, although it may decrease rather tha increase. A baseline in DY 2 is necessary to measure patients receiving the same protocol based diagnosis and standard of care.

Rationale

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Project Options

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS which has improved.

Although program components have been implemented and put in place, we still face the challenge of successful implementation. Also, additional interventions will be implemented in the future (shift assessments on all in-house patients, etc.). To be successful we need to work on processes that create time delays, non-adherence to order set and, failure to identify/diagnose sepsis. We are at 50% compliance in implementing Sepsis Bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

Project Components

The project components to report metrics for Sepsis Mortality and Average Length of Stay are necessary to measure the success of implementing the Sepsis Improvement Plan.
A Sepsis Improvement Plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, Inpatient Units, and EMS etc), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay compliance with Sepsis diagnosis and protocols for Sepsis Bundles are critical. In implementation of a plan, it is necessary to examine the plan as it is implemented, understand what is working and what is not, identify barriers and make corrective action. Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvement.

Unique Community Need Identification Numbers the Project Addresses

This project addresses identification number CN.11 Patient Safety and Quality from the community needs assessment. The program will improve the health outcomes for patients diagnosed with severe sepsis or sepsis shock.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Applying process improvement methodologies to the Sepsis program will greatly enhance the chances of being success in implementing the plan and seeing reductions in mortality and average length of stay for improved health outcomes.

Related Category 3 Outcome Measure(s):

- IT-4.8 Sepsis mortality
- IT-4.9 Average length of stay

Applying process improvement methodologies to Sepsis programs greatly enhances chances of being successful in implementing the plan and seeing reduction in mortality and average length of stay.

We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis: Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Relationship to other projects

This project supports the population focused improvements 111905902.4.4 RD-3 Potentially Preventable Complications (PPCs) and 111905902.4.6 RD- 5 Emergency Department. Improved quality with evidence based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting and ED care and treatment decisions.

Related Category 4 Population-focused improvements

- RD-3: Potentially Preventable Complications
- RD-5: Emergency Department

Relationship to other Performing Providers and Plan for Learning Collaborative

Related projects (Sepsis Resuscitation and Management improvement) include 020943901.2.3 (Medical City Dallas), 094192402.2.2 (Medical Center of Lewisville) and 127295703.2.6 (Parkland Health & Hospital System)

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared

learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology: . Denton Regional Medical Center defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The population expected to be positively impacted by the project for mortality was 531 which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 25. The estimated pricing for morality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages , and quality of life. This totaled approximately $258,375 for 5 years.
The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 10 days per patient. This was estimated at total of reduced in patient days by DY 5 of 704. The estimated cost per day for a sepsis patient is $1,049. This totaled approximately $739,230.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $258,375.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 1. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $110,885.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.
This value was estimated as a proportion of mortality reduction at $258,375.
To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.
This value was estimated as a proportion of length of stay reduction at $107,551.

The total value of the project then was estimated at $1,732,791. Approximately 79% of the total value was assigned to Category 2 project ($1,370,117)and the remaining 10.46% of value

assigned to Category 3 outcome for Sepsis Mortality ($181,338) and 10.46% assigned to Category 3 outcome for reduced Average Length of Stay ($181,336).

Rationale/Justification: The outcome improvement targets are dependent on the target population served (sepsis patients have increased rates of mortality), size, and also current processes in place that already treat Sepsis.

Community benefits were calculated using the following factors: lost productivity (net of lost wages), worker presenteeism, lost in payroll taxes and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, and risk and project scope.

Project Option 2.4.1 - Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

Unique Project ID: 111905902.2.2
Performing Provider/TPI: Denton Regional Medical Center/111905902

Provider: Denton Regional Medical Center is a 179-bed acute care hospital in Denton County, Texas serving a primary and secondary service population of approximately 430,000.

Intervention(s): This project will create workgroups under a steering committee to implement improvement work on patient experience targets. The goal is to have multiple process improvement events each year from DY 3 through DY 5, at least 2 per year to streamline processes that are not resulting in optimal patient experiences as part of continuous quality improvement. At DY 4 and DY 5, we have routine, formalize updates to employees on the efforts the organization is undertaking to improve the experience of its patients and their families with organizational displays. We expect in DY 4 there are 10 such updates and DY 5, 15 updates.

Need for the project: We currently are below the 75% percentile in Grand Composite Scores for HCAHPS survey. Key scores are include communication with nurses and doctor and communication regarding medications. Effective communication is critical for patient safety and quality of care of patients. Improvement efforts have not made material improvement in score in past 4 quarters.

Target population: The target population is IP, ED and OP patients at the hospital. Approximately 33% of our patients are either Medicaid eligible or indigent. We estimate 10,200 patients a year or 54,000 over the course of the waiver will be impacted. We do actively survey 100 patients a month/1200 a year

Category 1 or 2 expected patient benefits: The project seeks to improvement in patient satisfaction scores as measured by HCAHPS Grand Composite Scores. This will be a benefit to patients from better communication with nurses and doctors , better medication management, pain management and discharge planning. Studies have shown with improved patient experience, the quality of care patients experience also improves. This will result in reduce preventable complications such as infections, less readmissions and reduced medication errors. It is estimated patients impacted will be DY1-10,224, DY 2-10,531, DY 3-10,847, DY 4-11,172, DY5-11,507.

Category 3 outcomes: IT-6.1. Our goal is to improve Percent Improvement over baseline of patient satisfaction scores from 69% currently to 82% by DY5, for a 20% improvement.

Project Description

Denton Regional Medical Center is proposing a project to establish baseline is proposing a project to establish baseline Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey scores and implement a patient/family experience strategic plan. A steering committee will be formed and workgroups of the committee will work on process improvements for patient experience targets. Evaluation will be performed and documented to measure implementation progress, results and make adjustments to improvement plans. As part of the strategic plan, patient experience will be an integral part of employee orientation. . A communication plan on work being done to improve the patient experience will be developed and implemented to ensure all employees and physicians are included on progress and initiatives. Studies have shown that improved patient experience can improve patient health outcome and quality.

Goals and Relationship to Regional Goals:

The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose of performing this project is the engage all stakeholder such as leader and employees that can be the high level role to drive the patient experience improvement across the hospital for a cultural change at the organizational level

A major goal of the region is to pursue the triple aim of healthcare by improving patient experience of care, improve health of populations and reduce the cost of healthcare. Redesigning the patient experience at the in the region will impact the health of our community by keeping patients engaged in the healthcare system.

Challenges

The hospital has been participating in HCAHPS to measure patient experience in the hospital setting. Implemented strategies and training plans have not significantly improved scores. Denton Regional Medical Center has achieved Grand Composite score of 69% for 2010 Q3-2011 Q2 and 69% for 2010 Q4-2011Q3, which is consistently been below the CMS National Average. The scores summarize:

- how well nurses and doctors communicate with patients
- how responsive hospital staff are to patients' needs
- how well hospital staff help patients manage pain
- how well the staff communicates with patients about medicines, and whether key information is provided at discharge
- cleanliness and quietness of patients' rooms
- patients' overall rating of the hospital and whether patients' would recommend the hospital to family and friends

The project will address targeted patient experiences with that have not been improved by other initiatives.

5-Year Expected Outcome for Provider and Patients

We expected at end of waiver period we will be > 75th percentile on Grand Composite scores for CMS HCAHPS. The hospital will have improved processes for service that will increase quality and safety of care.

Starting Point/Baseline

Denton Regional Medical Center has achieved Grand Composite scores of 69% in 2010 Q3-2011 Q2 and 69% 2010 Q4-2011 Q3, which has consistently been below the CMS National Average.

Rationale

Patient experience scores are measured internally and reported quarterly from a Gallup Survey. These scores are shared with senior leaders and staff in various manners including Dashboards and reports. Various committees work on departmental and process issues but a coordinated, system wide approach is lacking. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization's resolve to get better and stay better. The overall approach to redesigning patient experience will be centered on cultural change at the organizational level. This will involve clinicians, patients and their families or caregivers. An organizational strategy will be developed so that we manage patient experience and create avenues to implement the strategic plan/vision. This project option is best for organizational integration which is critical to successful patient experiences.

Project Components

All core components will be implemented:

a) Organizational integration and prioritization of patient experience
b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patient's experience in getting through to the clinical practice;
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Establishing a steering committee with high level leadership is necessary to drive cultural change to impact patient experiences. A communication plan will be developed to inform all employees and physicians of the work of the steering committee and results to better integrate the process and changes into the culture. Process improvements needed will be identified and analyzed with Lean Six Sigma tools. The work groups will be empowered to implement changes identified and report back to the steering committee. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Evaluation, control and sustain activities are necessary for continuous quality improvements. The goal is to have multiple improvement events each year, at least 2 per year. We will measure the impact of improvements implemented from CMS HCAHPS scores.

Unique Community Need Identification Numbers the Project Addresses

CN.11: Patient Safety and Quality

How the Project represents a new initiative

This is a new initiative for Denton Regional Medical Center. It currently does not have a structure or feedback mechanism this program will implement for patient experience improvement.

Related Category 3 Outcome Measure(s):

IT-6.1: Percent improvement over baseline of patient satisfaction scores will be the focus of the patient satisfaction improvement plan.

An organizational strategy will be developed so that hospital can manage patient experiences and create avenues to implement the strategic plan/vision. Performance will be measured, among other factors, by the extent to which patient experience improves systematically.

In October 2005, the Joint Commission's Journal on Quality and Patient Safety published a series of case studies of healthcare institutions' efforts to improve both quality and safety. One of these was from Lehigh Valley Hospital in Allentown, Pennsylvania, which used active engagement of patients and families in attempting to improve patient safety. Anthony, R., Ritter M., Davis, R., Hitchings, K., Capuano, T. A., &Mawji, Z. (2005, October). Lehigh Valley Hospital: engaging patients and families. Joint Commission Journal on Quality and Patient Safety, 31(10), 566-572.

Weingart and colleagues (2006) examined inpatients' reports of service "incidents" — deficiencies in service quality such as waits/delays, poor communication, poor care coordination, lack of respect for personal preferences, or environmental issues. They found that roughly 40% of patients reported at least one incident and that reporting of incidents was associated with diminished patient satisfaction. Weingart, S. N., Pagoviceh, O., Sands, D. Z., Li, J.

M., Aronson, M. D., Davis, R. B., Phillips, R. S., & Bates, D. W. (2006, April). Patient-reported service quality on a medicine unit. International Journal of Quality in Health Care, 18(2), 95-101

Also, Kaldenberg and Trucano (2007) examined facility-level relationships between hospital-acquired infection (HAI) rates and patient perceptions of specific aspects of hospital quality in the State of Pennsylvania. Specifically, they chose three questions from an inpatient survey thought to measure practices that, when poorly executed, could create a more infection-prone environment: ratings of cleanliness; of the skill of the person who took the patient's blood; and of nurses' response to the call button. All three were found to be significantly, negatively correlated with HAI rates. Kaldenberg, D. & Trucano, M. (2007, August 22). The relationship between patient perceptions of hospital practices and facility infection rates: Evidence from Pennsylvania hospitals. Patient Safety & Quality Healthcare

Relationship to other projects

This project is to redesign to improve the patient experience. This project supports 111905902.4.3 RD-2 Potentially Preventable Readmissions- 30 days and 111905902.4.4 RD -3 Potentially Preventable Complications. An improved patient experience has been shown to correlate to improved quality of care and safety. This project also support 111905902.4.5 RD-4 Patient-centered healthcare. The project will implement training and improvement work on experience targets aimed to increasing patient satisfaction with the hospital, nurses and physicians that will result in a better patient experience.

Relationship to other Performing Providers' projects and Plan for Learning Collaboratives

The following providers are also proposing projects related to improving the patient experience:

- Las Colinas Medical Center: 020979301.2.1
- Medical Center of Lewisville: 094192402.2.1

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:

Denton Regional Medical Center defined the population that will be directly impacted by the project as patients with Medicare and all patients who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients

surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 5 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The Medicare average volume per year of 4,500 cases and rate per Medicare case of $8,827 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY5 -1.5% . This totaled $1,748,045 for a 5 year period.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $349,609. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $ 348,443.

The total value of the project was calculated at $2,446,907. Approximately 79% of the project value was assigned to the Category 2 project, $1,934,127 and 21% to the Category 3 project, $511,970.

Rationale/Justification: The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, cost avoidance, and risk and project scope.

Project Option 2.1.2 - Enhance/Expand Medical Homes: Medical Home in partnership with Mission East Dallas

Unique Project ID: 094194002.2.1

Performing Provider Name/TPI: Doctors Hospital at White Rock Lake/ 094194002

Summary

Provider: Doctors Hospital at White Rock Lake is a 218-bed acute care hospital in Dallas, Texas serving a 260.30 square mile area and a population of approximately 735,307. Doctors Hospital at White Rock Lake has a patient population that is made up of about 30.6% Medicaid and uninsured patients.

Intervention(s): This project will expand the delivery of care provided through the Patient-Centered Medical Home (PCMH) model through partnership with Mission East Dallas. Doctors Hospital at White Rock Lake will ensure that vital services at Mission are not lost as a result of the loss of Project Access Dallas funding, hire at least one additional case worker to ensure that high-risk and chronic-care patients are appropriately matched with community providers, like Mission East, develop shared health information exchange through EMR to increase the quality of care through more effective patient monitoring, medication management, and diagnostic capabilities, and increase the hours of availability at Mission East.

Need for the project: Due to a severe shortage of primary and specialty care access in Region 9, including the heavy burden borne by Parkland (Dallas County's public hospital), the Dallas-area healthcare community developed a successful initiative to reduce the burden ~~of~~ on acute care settings in the county through the creation of local clinics and Patient centered Medical Homes (PCMH), through Project Access Dallas.

In 2012, Mission East Dallas has a capacity of 10,100 patient visits per year, for approximately 3,200 unique patients. Unfortunately, the availability of funding for this crucial program has been redirected to other healthcare needs in the Dallas community. As a result of the unexpected unavailability of funding, Mission East Dallas planned to drastically reduce its scope, or even shut down, beginning in March of 2013 (coinciding with the withdrawn funding flow). To address this need, Doctors Hospital at White Rock Lake , through the implementation of this DSRIP project, will partner with Mission East Dallas, a community/charity clinic that has NCQA accreditation as a medical home. As a result of this partnership, Doctors Hospital at White Rock Lake and Mission East will be able to channel the high-risk and chronic-diseased patients to a more appropriate healthcare environment. In many cases, the ED is the sole point of entry to the healthcare system; this project will promote access to primary care resources and follow-up care, which will result in a reduction in unnecessary ED visits, and an overall cost-savings for the Dallas healthcare community.

As mentioned above, this project will increase Mission East's ability to serve patients after hours, as a large number of their most vulnerable patient population, including patients with chronic diseases, such as diabetes, need to utilize the clinic during hours when regular clinics are not available to them and the alternative is a local Emergency Room. Increased access to primary care is widely reported to provide value to patients and to communities.

Target population: Patients discharged from Doctors Hospital at White Rock Lake that are high-risk, or chronic disease patients that can seek follow-up care and medication management in an ambulatory care setting. We anticipate that about 2,500 encounters will be discharged that have a potential benefit from assignment to a Medical home.

Category 2 expected patient benefits: We do not expect any patients to directly benefit from this project in DY2, as Doctors Hospital at White Rock Lake and Mission East are working to implement their partnership including establishing referral processes and establishing IT systems to allow cross-facility EMR. In DY3, we expect that about 250 people will be assigned to the Mission East medical home, about 300 in DY4, and about 375 in DY5.

Doctors Hospital at White Rock Lake will begin assessing patients on discharge to determine whether a placement at the Mission East medical home would be an efficient use of health care resources. Because many high-risk and chronic care patients require ongoing medication management, follow-up care, and frequent intervention, it is often beneficial for the patient to have a "home base" in a primary care setting. This promotes the Waiver goals of promoting access to the appropriate care in the appropriate setting.

Category 3 outcomes: This project's focus is giving high-risk patients with chronic diseases access to primary care. This increase access to follow-up care and medication management in an ambulatory care setting will result in many healthcare outcomes, including a reduction in patients with hemoglobin levels above 9.0% (IT-1.10 Diabetes Care), and an increase in cervical cancer screenings in women between the ages of 21 and 61 (IT-12.2 Cervical Cancer Screening).

Project Description

Dallas County's public hospital, Parkland, is at, or has exceeded, its currently available primary and specialty care capacity. Community hospitals and private physicians are limited in their ability to meet the day to day routine and preventative care needs of the local population, based on current reimbursement/financing mechanisms. A successful initiative to reduce the burden of care in the county has been the creation of local clinics and Patient centered Medical Homes (PCMH) to provide preventative and routine care, reducing the volume and expense of acute care emergency room and hospital admissions due to unavailability of preventative care. To address this challenge, Doctors Hospital at White Rock Lake will join with Mission East Dallas to expand and enhance the delivery of care provided through the PCMH model. This plan builds upon existing resources/relationships and focuses on transforming care in East Dallas toward a

patient-centered medical home. The PCMH provides a primary care "home" for the patients. Patients are assigned to a "home" with a health care team who provides services based on a patient's unique health needs, effectively coordinates the patient's care across inpatient and outpatient settings and proactively provides preventive, primary, routine and chronic care.

Benefits of this Medical Home project include:

- a single point of accessible, continuous, comprehensive and coordinated medical care which includes specialists, hospital and post-acute care.

- A dedicated nurse or social worker manager from Doctors Hospital at White Rock Lake that will respond to patient referrals, ~~to~~ facilitate efficient hospital discharge, and coordinate post-acute care connection to a primary care clinic or physician.

- Increased access to primary care services through the transportation, health navigation, and care plans implemented by Mission East in its role as the patients' medical home.

- More efficient medication management for patients with chronic diseases that are often on several medications to manage their symptoms and prevent complications, as well as assistance from the medical home staff in obtaining more affordable generic products through patient assistance programs.

Staff performing specialty physician care referral management are dedicated to connecting patients and their health information to specialty care network, upon referral from a primary care provider~~.~~ to reduce the number of days between the primary care physician's decision for a specialty care consultation and the patient's actual specialty care physician visit.

- Dedicated registered Nurses and/or advance practice nurses to provide case management and house calls to

provide chronic disease management to complex patients. It is estimated that 5-10% of the targeted population will require Case Management services (and house call when necessary), which enables Mission East Dallas to accept the sickest, most challenging patients from participating hospitals.

Project Goals

This DSRIP project to establish a Medical Home partnership between Doctors Hospital at White Rock Lake and Mission East seeks to accomplish several goals: (1) expanding Mission East's ability to continue offering its services as a medical home in light of the loss of Project Access Dallas funding, (2) increasing the number of patients from Doctor's Hospital at White Rock Lake that have access to a medical home, and (3) establishing shared information technology share clinical data among the entities.

Challenges/Issues

Community hospitals and private physicians are limited in their ability to meet the needs of the growing number of the uninsured population. This project aims to expand access to this population by coordinating with Mission East Dallas to increase efficiency and reduce the cost of providing care to this population. Options for the uninsured to access coordinated and comprehensive health care are limited. Doctors Hospital's service area extends south and west out the I-80 / 175 corridor where time and access to care is limited, especially for under-resourced populations.

This project was specifically selected because the community has a ten year history of working together to address these needs of eligible uninsured residents in Dallas County through Project Access Dallas. Although that program has disbanded, Doctors Hospital at White Rock Lake and Tenet Healthcare remain committed to the community goal of providing patients with ~~additional~~ high quality services in the appropriate setting that are accountable and measurable and improve their care and health care experience.

5 Year Expected Outcomes

The expected outcome of this partnership between Mission East and Doctors Hospital at White Rock Lake is an increased access to primary care for those high-risk and chronic care patients that require follow-up care, medication management, and preventative care that are currently utilizing the ED as a resource of disease management and primary care. Through increased access, these patients will see greater management of their chronic disease (such as diabetes), as well as receive vital preventative care (such as cervical cancer screenings).

How this project is related to other regional goals

A major goal of Region 9 is to provide improved access to coordinated primary and specialty care by underserved individuals in the region. This project would contribute to achieving that goal in East Dallas by collaboration between Doctors Hospital at White Rock Lake and Mission East Dallas, which is committed to identifying eligible uninsured residents and providing the option of access to a patient centered medical home.

Starting Baseline

Mission East Dallas, a NCQA recognized medical home, has not had a hospital partner like several other indigent care providers. Their unduplicated patients have been lower than other area clinics because they did not have hospital partners. This partnership will provide additional support in expanding Mission East Dallas' capacity from 10,100 patient visits per year. The clinic had 3,200 unique visits in 2012. Currently, Doctors Hospital at White Rock Lake does not directly refer any patients to Mission East, and this project will result in increased access to a

medical home for patients with a high-risk or readmission or a chronic disease that can be managed in an ambulatory setting.

Rationale

As indicated in the Dallas Fort Worth Hospital Council's RHP 9 Community Needs Assessment, there is a strong demand for primary and specialty care services. The demand for hospital, primary care and specialty care services exceeds the supply of available medical physicians in the hospital's service area, thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Many primary care physicians accept a limited number of the Medicaid/Uninsured population due to the lack of coordination of care and access to appropriate ancillary services. Consequently, many residents seek primary care treatment in emergency care settings resulting in increased healthcare costs, increased emergency department wait times, and visits which would be avoidable if primary care was local and available. Thus, the improved and continued support to physicians, community/charity clinics and hospitals through the exchange of information, coordination of services with interconnected health systems, physicians and community/charitable clinics and the implementation of innovative approaches can have a significant impact on the uninsured ability to access care and improve outcomes. We have selected this project to enhance the role of the of community/charity clinics by creating more patient centered medical care home options in the region.

Project Components:

This project will accomplish the following project components:

a) Improve data exchange between hospitals and affiliated medical home sites
    - Doctors Hospital at White Rock Lake will work with Mission East in DY2 and DY3 to integrate the two entities' information technology to allow shared access to patient records. This process will increase the efficiency of medication management, and ensuring proper follow-up care.

b) Develop best practices plan to eliminate gaps in the readiness assessment
    - Case managers at Doctors Hospital at White Rock Lake will work to address best practices in identifying, educating, and directing patients to the services and support offered through their assigned medical home, Mission East.

c) Hire and train team members to create multidisciplinary teams including social workers, health coaches, care managers, and nurses with a diverse skill set that can meet the needs of the shared, high-risk patients

- Doctors Hospital will hire or train at least one additional case manager in DY 3 as part of its effort to increase patients' assignment to a medical home. Existing case managers will be trained to identify high-risk and chronic disease patients that would benefit from being assigned to a medical home for follow-up care and future primary care needs.

d) Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients

   - Mission East and Doctors Hospital at White Rock Lake have worked to develop and implement a collaboration focused on treating high-risk patients in a more appropriate setting. This project seeks to get patients the appropriate care in the appropriate setting, rather that utilizing the ED as the primary access point for managing their disease.

e) Evaluate the success of the intervention at decreasing ED and inpatient hospitalization by shared, high-risk patients and use this data in rapid-cycle improvement to improve the intervention

   - Doctors Hospital at White Rock Lake and Mission East will meet throughout DY2 and DY3 to plan and coordinate this DSRIP project. These meetings and workgroups will continue to confer in DY4 and DY5 to identify inefficiencies, ensure streamlined medical home assignment, and track benefits of patients that are assigned to Mission East.

f) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

   - Doctors Hospital at White Rock Lake and Mission East are committed to continuing the strong partnership that has formed as a result of this DSRIP project. As part of the meetings identified in (e), each entity will evaluate ways to improve quality for patients and the overall healthcare delivery system.

Reason for selecting milestones/metrics: Our milestones measure an increased population receiving care through a PCMH model of care: (1) we are establishing and implementing medical home assignment criteria, (2) we are utilizing evidence based training materials for

medical homes based upon model change concepts, and (3) we are increasing the number of eligible patients assigned to a medical home

Community Needs Assessment Identification Number

- CN.3 Healthcare Capacity
- CN.8 Chronic Disease

Describe how the project represents a new initiative or significantly enhances an existing delivery system reform initiative

The Medical Home partnership between Doctors Hospital at White Rock Lake and Mission East accomplished several goals: (1) expands Mission East's ability to continue offering its services as a medical home (where it otherwise would have been significantly reduced or disbanded), and increases the number of patients from Doctor's Hospital at White Rock Lake that have access to medical home, (2) through the health information exchange, links clinical data sharing between performing providers, physicians and community/charity clinics and (3) establishes a quality improvement committee to look at clinical outcomes.

Related Category 3 Outcome Measures

- IT-1.10 Diabetes Care. Our goal is to decrease the percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who have hemoglobin A1c (HbA1c) control >9.0%.
- IT-12.2 Cervical Cancer Screening. Increase the number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.

Reasons/rationale for selecting the outcome measures: This project's implementation will allow patients identified as high-risk or with a chronic disease to have access to primary care services, follow-up care, and case management. Access to ambulatory care will increase diabetes management, as measured in IT 1.10. Additionally, once these patients are assigned to a medical home, they will have increased access to preventative healthcare, such as cervical cancer screenings, as measured in IT 12.2. Not only do these outcomes represent increased healthcare availability for these high-risk patients, it also represents an overall cost-savings to the healthcare delivery system.

Relationship to other Projects

Other related projects include Project 0904194002.2.2 (Expand Care Transitions Programs), which implements an enhanced discharged planning process to ensure that patients are partnered with community resources, have comprehensive follow-up care instructions, and

implement a follow-up call to ensure patients are adhering to a follow-up care regimen, and have contacted a primary care provider where necessary.

Relationship to other Performing Provider Projects and Plan for Learning Collaborative

Other medical home projects include:

Children's Medical Center:	138910807.2.1
HCA Medical City Dallas Hospital:	020943901.2.4
Methodist Dallas Medical Center:	135032405.2.3
Parkland Health & Hospital System:	127295703.2.1
Parkland Health & Hospital System:	127295703.2.11
Texas Health Presbyterian Hospital Dallas:	020908201.2.3
UT Southwestern Medical Center:	126686802.2.1

Plan for Learning Collaborative. Doctors Hospital at White Rock Lake, Tenet Healthcare, and Mission East Dallas will be establishing a learning collaborative to share lessons learned and best practices. This collaborative will span DYs 2-5 and include meetings, workgroups, or conference calls on at least a quarterly basis. Meeting agendas and notes, including shared learning, will be documented and reported through DSRIP program reporting requirements.

Project Valuation

$2,555,600. In determining the value of this project, Doctors Hospital at White Rock Lake considered the extent to which patients will benefit from assignment to a medical home increased will address the community's needs, the high-acuity population this project will serve, the resources and cost necessary to implement the project, and the project's ability to meet the goals of the Waiver (including providing the appropriate care in the appropriate setting, supporting the development of a coordinated care delivery system, improving outcomes while containing costs, and improving the healthcare infrastructure). Specifically, Doctors Hospital at White Rock Lake considered the significant cost savings that will result from the successful implementation of this project when patients are navigated away from high-cost treatment sites such as Emergency Rooms, investment in information technology to share patient data with Mission East, and costs associated with services that are scheduled to be lost through Project Access Dallas, including

Project Option 2.12.1 - Implement/Expand Care Transitions Programs

Unique Project ID: 094194002.2.2

Performing Provider Name/TPI: Doctors Hospital at White Rock Lake/094194002

Summary

Provider: Doctors Hospital at White Rock Lake is a 218-bed acute care hospital in Dallas, Texas serving a 260.30 square mile area and a population of approximately 735,307. Doctors Hospital at White Rock Lake has a patient population that is made up of about 30.6% Medicaid and uninsured patients.

Intervention(s): This DSRIP project will develop a standardized care transition process for case managers to utilize in discharging patients, increase partnership with community-based providers to ensure that patients receive appropriate post-acute care services in an appropriate setting. To accomplish this, Doctors Hospital at White Rock Lake will hire an additional ED case manager, engage with community organizations, perform follow-up calls to ensure proper adherence to care instructions, and determine whether the patient requires additional community placement for ongoing primary or preventative care. The intent of this project is to improve the core discharge planning function and support a safe, effective, and efficient transition to post-acute care. The ultimate goal will be to reduce preventable readmissions by identifying and developing comprehensive discharge plans that meet the needs of patients with varying levels of acuity, resources, and access to care outside the ED.

Need for the project: According to the Medicare Payment Advisory Committee, 76 percent of re-hospitalizations occurring within 30 days in the Medicare population are potentially avoidable. Evidence suggests that the rate of avoidable re-hospitalization can be reduced by improving core discharge planning and transition processes out of the hospital, and by improving transitions and care coordination at the interfaces between care settings.

Target population: This project will target patients discharged from Doctors Hospital at White Rock Lake with one of the following primary diagnoses: COPD (DRGs 190-192), Pneumonia (193-195), Acute MI (280-282), Heart failure (291-293), and Diabetes (637-639).

Category 2 expected patient benefits: The ultimate goal will be to reduce preventable readmissions by identifying and developing comprehensive discharge plans that meet the needs of the high-risk population early in the patient stay. A comprehensive and reliable discharge plan, along with post-discharge support, can reduce readmission rates, improve health outcomes, and ensure quality transitions. We do not expect any patients to directly benefit in DY2 or DY3, as we will be developing and implementing a standardized care transition process and hiring an additional ED case manager to facilitate partnering patients with community-based resources for primary care, preventative care, and follow-up care. In DY4, we

expect that about 198 discharge encounters will receive care transition based on approved clinical protocol, and about 329 in DY5.

Category 3 outcomes:

- IT-1.10 Diabetes Care. Our goal is to decrease the percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who have hemoglobin A1c (HbA1c) control >9.0%.

Project Description

This project will support and enhance discharge planning assessment and intervention, with the development of tools that assist case managers to improve the core discharge planning function and support a safe, effective, and efficient transition to post-acute care. The ultimate goal will be to reduce preventable readmissions by identifying and developing ~~A~~ a comprehensive and reliable discharge plan, partnership with community-based organizations, additional staff to facilitate the care transition process, and providing ~~along with~~ post-discharge support to ensure patients are seeking follow-up care and have primary care resources in the community. goal of the project is to ensure that the hospital discharge is accomplished appropriately and that care transitions occur effectively and safely Transitions from inpatient care to the home setting will be supported and readmissions or revisits within 30 to 60 days will be reduced. Following the implementation of the project, quality improvement activities will be conducted to foster continued learning by staff regarding the most effective methods for ensuring quality care transitions.

Required Core Project Components

This project will accomplish the following project components:

a) Review best practices from a range of models (e.g. RED, BOOST, STAAR, INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc).
    - Doctors Hospital at White Rock Lake will review best practices to determine the most appropriate tool for use in creating standardized transition process in DY2.
b) Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool (e.g. Institute for Healthcare Improvement (IHI)
    - The case management coordinator will conduct an analysis in DY2 to inform the policies and protocols developed for standardized care transitions.
c) Integrate information systems so that continuity of care for patients is enabled
    - Doctors Hospital at White Rock Lake will work with community partners, such as Mission East, to ensure that information systems are compatible and enable each provider to more efficiently manage the patients throughout the transition and follow-up process.

d) Develop a system to identify patients being discharged potentially at risk of needing acu te care services within 30-60 days
    - In DY2 and DY3, Doctors Hospital at White Rock Lake will identify patient being discharge with a high risk of readmission. This information will assist in targeting those patients for more immediate ambulatory care interventions, and more frequent follow up to attempt to prevent worsening health outcomes, or a subsequent acute care procedure.

e) Implement discharge planning program and post discharge support program
    - In DY2, Doctors Hospital at White Rock Lake will develop a comprehensive discharge planning program that utilizes providers in the community, as well as follow-up calls to discharged patients to ensure proper follow-up care.

f) Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, and home care providers.
    - Throughout the Waiver, Doctors Hospital at White Rock Lake will continue to meet with and consult with community-based providers to ensure an efficient healthcare delivery system that is focused on providing appropriate care in the appropriate setting.

g) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Reason for selecting milestones/metrics: Our milestones were chosen to (1) develop a standardized transition process, (2) partner with community-based organizations to ensure that patients are matched with an appropriate ambulatory setting, (3) hire/train an additional case manager to handle a more in-depth process, and (4) increased population being discharged using standardized care transition protocols. These steps are critical in developing a meaningful discharge process that addressing ongoing patient needs for follow-up care, medication management, and preventing unnecessary readmission.

Community Needs Assessment Identification Number

- CN.3 Healthcare Capacity
- CN.8 Chronic Disease

Describe how the project represents a new initiative or significantly enhances an existing delivery system reform initiative

Currently, the discharge process is disjointed and does not focus on post-acute care follow-up. As a result, there are preventable readmissions returning to the ED as their primary source of medical care. This project will significantly enhance the discharge process, partnership with community-based organizations, and follow-up calls to ensure that patients are seeking appropriate care in the appropriate settings.

Goals and Relationship to Regional Goals

The goal of this project is to implement improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. Safe, effective, and efficient care transitions and reduced risk of potentially preventable readmissions require cooperation among providers of medical services, social services, and support services in the community and in long-term care facilities. The discontinuity of care during transitions typically results in patients with serious conditions, such as heart failure, chronic obstructive pulmonary disease, and pneumonia, falling through the cracks, which may lead to otherwise preventable hospital readmission. The goal of this DSRIP project is to ensure that the hospital discharges are accomplished appropriately and that care transitions occur effectively and safely. Providing appropriate care in the appropriate setting is a major goal of the Waiver and has been a focus for Tenet and Doctors Hospital at White Rock Lake, as well as other Region 9 providers. This project is part of a Regional effort to streamline the discharge process and ensure that patients are receiving the follow-up care they need in ambulatory care settings, which will result in improved patient outcomes and cost savings to the healthcare delivery system.

Challenges/Issues

Due to limited resources in the Dallas healthcare delivery system, it can be difficult to hire, train, and educate staff on the importance of standardized care transitions and community placement. Additional staff and training will be put in place to ensure that current personnel are aware of all existing and new community-based organizations that Doctors Hospital White Rock Lake is partnering with to create a more comprehensive care transition process.
The identification of patients at risk for readmission is an area of research and growing experience. Another ~~primary~~ challenge will be to standardize an approach to identifying risk categories and factors. Doctors Hospital at White Rock Lake will identify the most useful risk assessment tool or modify existing tools to meet the specific needs of the project.

5-Year Expected Outcome

Doctors Hospital at White Rock Lake will implement a standardized care transition process, develop partnerships with community-based organizations, hire/train an additional ED case

manager, and improve the percentage of patients receiving standardized care transitions by at least 25% in DY5. By focusing on the care transition process, patients can be added to care management teams, which will begin to use standard policies and protocols to reduce complications, readmissions, unnecessary ED visits, and improved overall health. Personal contact by healthcare personnel would encourage at-risk populations to become actively engaged in managing their own health. The expected result will be decreased ED visits, decreased specialty clinic visits and decreased preventable admissions/readmissions.

Starting Point/Baseline

As of 2012, the baseline year, Doctors Hospital at White Rock Lake does not have any designated case managers in the ED. Hospital-wide managers are often overloaded and unable to spend sufficient time working with the patient to determine the most appropriate community link. There is no coordinated system of referral to community-based organizations in place. Additionally, there is no mechanism to provide follow-up calls to each patient discharged, which would be useful to ensure that the patient was successful in meeting with his or her community provider.

Rationale

It is important to coordinate care with facilities outside a provider's own delivery system so that patients going in and out of the delivery system can receive optimal care, wherever possible. When a patient's transition is fractured or duplicative, the repercussions can be far-reaching, including hospital readmission, an adverse medical event, and even mortality. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs, patients cannot fully participate in their care.Additionally, poorly designed discharge processes create unnecessary stress for medical staff causing failed communications, duplication of effort and inefficiencies. A comprehensive and reliable discharge plan, along with post-discharge support, can reduce readmission rates, improve health outcomes, and ensure quality transitions. Patient transition is a multidimensional concept and may include transfer from the hospital to home, or nursing home, or from facility to home- and community-based services, etc.

According to the Medicare Payment Advisory Committee, 76 percent of re-hospitalizations occurring within 30 days in the Medicare population are potentially avoidable. This has been identified as perhaps the largest opportunity to improve the efficiency of care in the Medicare population. Non-Medicare populations affected include patients with chronic diseases, complex medical and social needs and patients with little or no funding resources for post-acute care needs. Evidence suggests that the rate of avoidable re-hospitalization can be reduced by improving core discharge planning and transition processes out of the hospital, and by improving transitions and care coordination at the interfaces between care settings.

Related Category 3 Outcome Measures

OD-1: Primary Care and Chronic Disease Management

- IT-1.10 Diabetes Care: HbA1c poor control

Our goal is to decrease the percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who have hemoglobin A1c (HbA1c) control >9.0%.

Reasons/rationale for selecting the outcome measure: This project's implementation will create a streamlined discharge process that focuses on linking patients with community-based providers that can address their post-acute care needs such as follow-up care, medication management, and preventative primary care. One of the main causes of continuous readmission are diabetes patients that do not have an alternate venue of care. These patients seek regular treatment and disease management services through the ED, which is inefficient to the Dallas healthcare delivery system. By placing these individuals with community organizations, it will improve patient outcomes, provide for the appropriate care in the appropriate setting, and allow high-acuity patients faster access to emergency services.

Relationship to Other Projects

This project links with the Category 2.1 Medical Home project in coordination with Mission East Dallas (094194002.2.1). The patient population expands beyond Mission East Dallas' population to serve an expanded community with enhanced case management. This project is part of Tenet's larger plans to expand and develop primary care and specialty care services in the Dallas County community, while improving access to care and containing the costs of care.

Relationship to Other Performing Providers' Projects in RHP and Plan for Learning Collaborative

This project will complement Parkland's primary care clinics, as well as other providers' efforts to improve discharge planning and case management to provide a more efficient healthcare delivery system. Providing appropriate care in the appropriate setting is a major goal of the Waiver and has been a focus for Tenet and Doctors Hospital at White Rock Lake, as well as other Region 9 providers.

Plan for Learning Collaborative. We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

$613,900. In determining the value of this project, Tenet considered the extent to which newly-implemented or expanded care transitions programs will address the community's needs, the population which this project will serve, the resources and cost necessary to implement the project, and the project's ability to meet the goals of the Waiver (including supporting the development of a coordinated care delivery system, improving outcomes while containing costs, and improving the healthcare infrastructure).

The valuation of this project takes into account the potential of better care transition management to improve quality of care and thereby improve patient satisfaction and patient outcomes. The valuation of this project also takes into account the challenges that Tenet will face in implementing this project in the hospital setting. Tenet will also work closely with Mission East Dallas on enhanced case management and smooth transitions for its patient population.

Project Option: 2.13.1 Design, Implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population with required components a) through e) (Lakes Regional Cognitive Enhancement Therapy)

Unique Project ID: 121988304.2.1 (Pass 2)
Performing Provider/TIP: Lakes Regional MHMR Center/121988304

Provider: Lakes Regional MHMR Center is a community-based provider of out-patient services to adults with serious mental illness, chemical dependency; to children and adolescents with serious mental illness or emotional disorders; to persons with autism, pervasive developmental disorders or intellectual disabilities; and to infants and toddlers with developmental delays. Lakes Regional MHMR Center's service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. The service area crosses four Regional Healthcare Partnership (RHP) areas and is mostly rural. Lakes Regional's community programs serve over 9,500 individuals each year Over 95% of our consumers are either Medicaid eligible or indigent.

Intervention(s): This project is the therapeutic application of a neurodevelopmental approach to recovery from schizophrenia and like conditions through activating frontal lobe executive function with computerized challenges, social awareness training and socially skills development over the course or a year. The program has been shown in evidence-based trials to help participants make substantial and sustainable gains in functioning on a number of dimensions not the least of which are community engagement and employability in more normalized settings.

Need for the project: To gain the skills necessary for recovery beyond stabilization, individuals need improvement of the sort that leads to lowering risk of hospitalizations, encounters with law enforcement and emergency departments, individuals with schizophrenic related disorders need adaptive social skills beyond the supportive array available through state funding to access a future of community connection, self-direction and self-esteem. The program is a needed addition to services allowing an avenue of progression in treatment as an option for individuals that have reached stability of symptoms on medication with potential for remarkable and lasting impact.

Target population: The target population is individuals with a schizophrenic related disorder the symptoms of which are stable on medication and other programmatic criteria. Approximately 95% of our patients are either Medicaid eligible or indigent.

Category 1 or 2 expected patient benefits: The project will provide a minimum of 60 graduates with improved cognitive function, motivation, problem solving, memory retention, mental resilience and flexibility by the end of DY5. . Each graduating participant will receive 168 hours over 48 weeks of computer-based cognitive exercises, psycho-educational group and individual coaching. The anticipated 12,096 cumulative client hours of training are expected to yield

productive, contributive members to the community with an increase in sense of control over symptoms and self-sufficiency.

Category 3 outcomes: IT-6.1 Patient Satisfaction
The projected outcomes relate to an improvement in access to care, the quality of care and health outcomes, as well as an overall improvement in health for the target population. To demonstrate improvement patient satisfaction on a validated instrument and process will inform the project on the improvement relevance to participants while reinforcing to each individual their own sense of efficacy. The projected improvement over baseline percentage is 10% for DY-4 and 15% for DY-5.

Project Description
Rural behavioral health clients, especially those with Schizophrenia like conditions, rarely have access to new and effective developments in therapeutic techniques with the possibility of improving functioning and quality of life beyond traditional medication and case management approaches. Compounded by the difficulties of distance, socio-economics and sparse delivery systems innovations, these clients usually receive diluted versions of skills programs after several revisions aimed at shortening and modifying for unskilled providers. Cognitive Enhancement Therapy is an evidence-based neurodevelopmental intervention for individuals with Schizophrenia and Schizoaffective disorders. Proven effective by a NIMH funded research grant and resilient with a three year follow-up study, CET is focused on the neurodevelopmental impairments of the disorders: specifically, the reduced frontal lobe cognitive functioning as it affects internal mental processes particularly socially appropriate interactions (NIMH Grant MH-30750). CET is a set of structured activities that exercise the brain's neuroplasticity capabilities to enhance neurocognitive development and social cognition using computer-based interactive software, group-based interactions and individual coaching sessions on a weekly schedule over forty-eight weeks. Each program is co-facilitated by two therapists with specific program related training to provide the computer lab assistance, interactive group, and individual coaching sessions (Hogarty, G. & Greenwald, D., 2006). Two overlapping groups of 8-12 participants can be run by a team. After the start-up preparations, the groups will begin in DY3 through DY5. Over the 12 month program, participants will (tracked by internal program measures) increase processing speed (a foundation for learning), social cognition (understanding of social cues) and social adjustment (appropriate response to social interactions).

Goals and Relationship to Regional Goals

The goals for participants in CET are measurable improvements in: quality of life; satisfaction in the treatment experience; improvement in Cognitive Symptoms of Impoverished, Disorganized and Rigid Thinking; increased Social Cognition traits - Tolerant, Supportive, Perceptive, and Self-Confident. The goals of the project for the Performing Provider is expanding the capacity of behavioral health services to better meet the needs of the patient population and community so that care can be better coordinated and the patient can be treated as a whole person, potentially leading to better outcomes and experience of care. Upon demonstrating success

through the waiver, Lakes Regional MHMR Center (LRMHMRC) will expand CET to other rural clinics and join other community centers in sharing the outcomes and advances in treatment with other mental health professionals in Texas.

Challenges

Under current funding constriction of mental health programming in Texas, stable and medicated individuals with a schizophrenic like condition are provided minimum services without expectation of their improving to the point of joining their community in a productive way. Providing this population with an effective training program that will lead to appropriate community involvement, reduced involvement with the criminal justice system, reduced inappropriate use of the emergency department (ED) a better quality of life, and increased personal efficacy, as well as, hope for their futures and positive recovery influence upon those individuals currently less stable are the challenges targeted by this project.

The project relates to the Region 9 goals to improve access to Behavioral Health services (CN.5) and to reduce the unnecessary use of Emergency Departments (CN.12). CET will also address individuals with Chronic Disease conditions (CN.8) by providing specialized recovery services.

The 5-year expected outcome:

Increases in cognition/thinking will improve motivation, problem solving, memory retention, mental resilience and flexibility (Hogarty, G. & Flesher, S., 1999). Social improvement will elevate participants' perspective taking, understanding themes and meanings, and appreciation of both spontaneity and enjoyment goal achievement. They will be able to identify meaningful adult roles as part of their personal recovery plan. Self-management skills will allow response to subjective cues of distress and adjustment to disability (Hogarty, G., Greenwald, D. & Eack, S., 2006). Since retention and program impact is high in the research literature, it is anticipated that the outcome will be an on-going program with ~~in excess~~ a minimum of 60 graduates having completed 168 service events and involved successfully in the community at large and in an alumni program that provides influence on newer individuals in clinic services opening recovery hope and making the possibilities of better days tangible. In short, the expectation is new productive and engaged citizens in the community less dependent on the community services than in the past.

Starting Point/Baseline:

CET is a new program design that will require basic development. Only one such program (privately funded) exists in North Texas for a self-selected population and is inaccessible to the population the LRMHMRC clinics serve. The LRMHMRC MH clinic has a large population of individuals who are stable on medications, in housing, and finances as potentially qualifying participants. These clients currently receive minimal services and many express the desire for more involvement to progress in their lives; however, State mediated managed care services are restricted. The managed care system effecting these clients had growth in enrollment that

outpaced funding such that the funding per person served is 30% less than when the program started in 1999 and is half that of the state average for other LMHAs (TriWest/Zia Partners, 2010). Given that Texas is 50th in mental health funding nationwide (National Alliance on Mental Illness, 2011), this means that the funding per person served in RHP 9 is among the lowest in the nation. Under the guidance of CET origination team members as contracted trainers, LRMHMRC will develop the staff, program components, evaluative instrumentation, and participant criteria for establishing baseline and selection in DY2 of the waiver. Tie to RHP Goals needed.

Rationale

2.13.1 Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population.

One of the bedrock ideas of the recovery concept is the normalization of routine interactions within the community which includes socially appropriate behavior for acceptance and reciprocity. The CET design is meant to enhance the mental capacities that underlay social awareness and appropriate interaction. Through the program participants would build the internal skills to be able to interact with the community in which they live with greater understanding and ease (Hogarty, G. & Flesher, S., 1999). These skills will lead to inclusion and acceptance in social interactions, connection with social groups and the ability to acquire and sustain employment (Eack, S., et al, 2011).

Fundamentally, the skills will improve the quality of life of the individual through more normalized social involvement and the inherent benefits of a sense of inclusion in social participation. This will make participants individually and as a group less likely to make inappropriate ER visits and encounter the criminal justice system. Against alternatives CET is evidenced to be the best available treatment to move individuals in this population from merely stable with cognitive inflexibility and social withdraw toward normalization and true recovery for the rural mental health center population. For the reasons above, 2.13.1 Design, implement and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population was the option chosen.

Project Components

The project components of 2.13.1 are:

1. Assess size, characteristics and needs of target population- this is to be determined through gap analysis surveying in DY2.
2. Review literature- DY2 will also be a period to review the relevant literature and engage services in project development.
3. Develop project evaluation plan- a Plan, Do Study, Act (PDSA) approach will be instituted for continuous evaluation and quality improvement; the Adult Needs and Skills Assessment (ANSA) scores taken quarterly along with the SF-36 (a validated quality of life survey) responses and in program functional testing will be used in the evaluation process.

4. Design models- Cognitive Enhancement Therapy is an Evidenced Based Program and consultation will advise the adaptations to the current context.
5. Assess the impact of interventions- as above, continuing evaluation of client improvement on several dimensions with standardized instruments will inform personal impact and across participants indicate programmatic impact.

Reasons for selecting the milestones and metrics

DY2 and DY3 Process Milestones enable the project start-up P-2 and P-4. DY 4 and 5 Milestones (I-5) will reveal the functional changes that have occurred via the intervention. These functional improvements will be tracked by ANSA which by the start-up of the program will be the assessment instrument used for all Texas adults with SMI. This will provide comparative data to individual baseline to inform the program across each group at four points. The Individual electronic medical record will be used to track compliance with taking prescribed antipsychotic medications (I-3) of participants over the year of participation. Improvements will also be scored on CET internal instruments.

Unique community need identification number the project addresses:

CN.5 Behavioral Health – Data sources for the RHP 9 CNA provide an account of the limitations in services of the present state funded system for individuals with SMI (CN.8). CET will also help to reduce the use of the Emergency Departments and Readmissions (CN.12).

Related Category 3 Outcome Measure(s):

OD- 6 Patient Satisfaction was chosen as the Outcome Domain for the project with IT-6.1 as the Improvement Targets. LRMHMRC will employ the validated instrument Mental Health Statistics Improvement Program Consumer Survey (MHSIP). The MHSIP (developed by CMHS and SAMHSA for community MH block grant requirements) provides a standard instrument and protocol for data collection and processing and is seen as an outpatient mental health equivalent to the Clinician and Group Consumer Assessment of Healthcare Providers and Systems (CG-CAHPS). Patient satisfaction is a fundamental way to ensure that LRMHMRC is meeting the needs of the SMI population in their integrated care. It will inform the PDSA process for continued improvement. The initial preparations for the project with health data collection on service participants to profile baseline function will be used to determine other outcome targets related to the health and risk statistics of individual participants and the population in the clinics.

Relationship to other Projects

The LRMHMRC Tele-Medicine Project (121988304.1.2 Introduce, Expand or Enhance Telemedicine / Telehealth) will allow coverage of individual support and coaching from other clinic sites for coverage during trainer absences as well as collaboration and consultation.

Related Category 4 Population-focused improvements: N/A

Relationship to Other Performing Providers' Projects in the RHP

A few other providers are proposing similar projects hopefully reducing hospital emergency department use for behavioral crisis but are doing so in other counties. The target group for these other projects does not overlap with the area served by LRMHMRC. However, LRMHMRC will seek to share experiences in approach and lessons learned within the region toward discovering best practices.

We plan to play an active role in development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV-Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with outcomes of this project to obtain additional perspectives that enable us to improve this project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation:

This valuation used cost-utility analysis which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). The QALY index incorporates costs averted when known (e.g., emergency room visits that are avoided). The proposed program's value is based on a value per QALY gained due to the intervention multiplied by number of participants. (Eichler, H. G., et al. (2004). "Use of cost-effectiveness analysis in health-care resource allocation decision-making: how are cost-effectiveness thresholds expected to emerge?" Value Health 7(5): 518-528.; http://download.journals.elsevierhealth.com/pdfs/journals/1098-3015/PIIS1098301510602161.pdf?mis=.pdf&refissn=1098-3015&refuid=S1098-3015%2811%2903563-7

A description of the method used, titled 'Valuing Transformation Projects'. A complete write-up of the project will be available at performing provider site.

Total Valuation: $3,490,488

Project Option 2.4.1-Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

Unique Project ID: 020979301.2.1
Performing Provider Name/TPI: Las Colinas Medical Center/ 020979301

Provider: Las Colinas Medical Center is a 100-bed acute care hospital in Dallas County, Texas serving a primary and secondary service population of approximately 800,000.

Intervention(s): This project will create workgroups under a steering committee to implement improvement work on patient experience targets. The goal is to have multiple process improvement events each year from DY 3 through DY 5, at least 2 per year to streamline processes that are not resulting in optimal patient experiences as part of continuous quality improvement. At DY 4 and DY 5, we have routine, formalize updates to employees on the efforts the organization is undertaking to improve the experience of its patients and their families with organizational displays. We expect in DY 4 there are 7 such updates and DY 5, 15 updates.

Need for the project: We currently are below the 75% percentile in Grand Composite Scores for HCAHPS survey. Key scores are include communication with nurses and doctor and communication regarding medications. Effective communication is critical for patient safety and quality of care of patients. Improvement efforts have not made material improvement in score in past 4 quarters.

Target population: The target population is IP, ED and OP patients at the hospital. Approximately 23% of our patients are either Medicaid eligible or indigent. We estimate 5,000 patients a year or 22,500 over the course of the waiver will be impacted. We do actively survey 100 patients a month/1200 a year

Category 1 or 2 expected patient benefits: The project seeks to improvement in patient satisfaction scores as measured by HCAHPS Grand CompositeScores. . This will be a benefit to patients from better communication with nurses and doctors , better medication management, pain management and discharge planning. Studies have shown with improved patient experience, the quality of care patients experience also improves. This will result in reduce preventable complications such as infections, less readmissions and reduced medication errors. It is estimated patients impacted will be DY 2-5,299, DY 3-5,564, DY 4-5,731, DY5-5,903.

Category 3 outcomes: IT-6.1 Our goal is to improve Percent Improvement over baseline of patient satisfaction scores from 71% currently to 85% by DY5, a 20% improvement..

Project Description

Las Colinas Medical Center is proposing a project to establish baseline Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) scores and implement a patient/family experience strategic plan.

A steering committee will be formed and workgroups of the committee will work on process improvements for patient experience targets. Evaluation will be performed and documented to measure implementation progress, results and make adjustments to improvement plans. As part of the strategic plan, patient experience will be an integral part of employee orientation. A communication plan on work being done to improve the patient experience will be developed and implemented to ensure all employees and physicians are included on progress and initiatives. Studies have shown that improved patient experience can improve patient health outcome and quality.

Goals and Relationship to Regional Goals

The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose of performing this project is the engage all stakeholder such as leader and employees that can be the high level role to drive the patient experience improvement across the hospital for a cultural change at the organizational level.

A major goal of the region is to pursue the triple aim of healthcare by improving patient experience of care, improve health of populations and reduce the cost of healthcare. Redesigning the patient experience at the in the region will impact the health of our community by keeping patients engaged in the healthcare system.

Challenges

The hospital has been participating in HCAHPS to measure patient experience in hospital setting. Implemented training plans have not improved scores. Las Colinas Medical Center has achieved Grand Composite score of 71% for 2010 Q3-2011 Q2 and 71% for 2010 Q4-2011Q3, which is consistently been below the CMS National Average. The scores summarize:

- how well nurses and doctors communicate with patients
- how responsive hospital staff are to patients' needs
- how well hospital staff help patients manage pain
- how well the staff communicates with patients about medicines, and whether key information is provided at discharge
- cleanliness and quietness of patients' rooms
- patients' overall rating of the hospital and whether patients' would recommend the hospital to family and friends

The project will address targeted patient experiences with that have not been improved by other initiatives.

5-Year Expected Outcome for Provider and Patients

We expected at end of waiver period we will be > 75th percentile on Grand Composite scores for CMS HCAHPS. The hospital will have improved processes for service that will increase quality and safety of care.

Starting Pointe/Baseline

Las Colinas Medical Center has achieved Grand Composite scores of 71% in 2010 Q3-2011 Q2 and 71% 2010 Q4-2011 Q3, which has consistently been below the CMS National Average.

Rationale

Patient experience scores are measured internally and reported quarterly from a Gallup Survey. These scores are shared with senior leaders and staff in various manners including Dashboards and reports. Various committees work on departmental and process issues but a coordinated, system wide approach is lacking. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization's resolve to get better and stay better

The overall approach to redesigning patient experience will be centered on cultural change at the organizational level. This will involve clinicians, patients and their families or caregivers. An organizational strategy will be developed so that we manage patient experience and create avenues to implement the strategic plan/vision. This project option is best for organizational integration which is critical to successful patient experiences.

Project Components

All core components will be implemented:

a) Organizational integration and prioritization of patient experience
b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patient's experience in getting through to the clinical practice;
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Establishing a steering committee with high level leadership is necessary to drive cultural change to impact patient experiences. A communication plan will be developed to inform all employees and physicians of the work of the steering committee and results to better integrate the process and changes into the culture. Process improvements needed will be identified and analyzed with Lean Six Sigma tools. The work groups will be empowered to implement changes identified and report back to the steering committee. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Evaluation, control and sustain activities are necessary for continuous quality improvements. The goal is to have multiple improvement events each year, at least 2 per year. We will measure the impact of the improvements implemented from CMS HCAHPS scores.

Unique Community Need Identification Numbers the Project Addresses

CN.11: Patient Safety and Quality

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This is a new initiative for Las Colinas Medical Center. It currently does not have the structure or feedback mechanism this program will implement for patient experience improvement.

Related Category 3 Outcome Measure(s)

IT-6.1: Percent improvement over baseline of patient satisfaction scores will be the focus of the patient satisfaction improvement plan.

An organizational strategy will be developed so that the hospital will better manage patient experiences and create avenues to implement the strategic plan/vision. Performance will be measured, among other factors, by the extent to which patient experience improves systematically.

In October 2005, the Joint Commission's Journal on Quality and Patient Safety published a series of case studies of healthcare institutions' efforts to improve both quality and safety. One of these was from Lehigh Valley Hospital in Allentown, Pennsylvania, which used active engagement of patients and families in attempting to improve patient safety. Anthony, R., Ritter M., Davis, R., Hitchings, K., Capuano, T. A., &Mawji, Z. (2005, October). Lehigh Valley Hospital: engaging patients and families. Joint Commission Journal on Quality and Patient Safety, 31(10), 566-572.

Weingart and colleagues (2006) examined inpatients' reports of service "incidents" — deficiencies in service quality such as waits/delays, poor communication, poor care coordination, lack of respect for personal preferences, or environmental issues. They found that roughly 40% of patients reported at least one incident and that reporting of incidents was

associated with diminished patient satisfaction. Weingart, S. N., Pagoviceh, O., Sands, D. Z., Li, J. M., Aronson, M. D., Davis, R. B., Phillips, R. S., & Bates, D. W. (2006, April). Patient-reported service quality on a medicine unit. International Journal of Quality in Health Care, 18(2), 95-101

Also, Kaldenberg and Trucano (2007) examined facility-level relationships between hospital-acquired infection (HAI) rates and patient perceptions of specific aspects of hospital quality in the State of Pennsylvania. Specifically, they chose three questions from an inpatient survey thought to measure practices that, when poorly executed, could create a more infection-prone environment: ratings of cleanliness; of the skill of the person who took the patient's blood; and of nurses' response to the call button. All three were found to be significantly, negatively correlated with HAI rates. Kaldenberg, D. & Trucano, M. (2007, August 22). The relationship between patient perceptions of hospital practices and facility infection rates: Evidence from Pennsylvania hospitals. Patient Safety & Quality Healthcare

Relationship to other projects

This project is to redesign to improve the patient experience. This project supports 020979301.4.3 RD-2 Potentially Preventable Readmissions- 30 days and 020979301.4.4 RD -3 Potentially Preventable Complications. An improved patient experience has been shown to correlate to improved quality of care and safety. This project also support 020979301.4.5 RD-4 Patient-centered healthcare. The project will implement training and improvement work on experience targets aimed to increasing patient satisfaction with the hospital, nurses and physicians that will result in a better patient experience.

Relationship to other Performing Providers' projects and Plan for Learning Collaborative

The following providers are also proposing projects to Redesign to Improve Patient Experience:

- Denton Regional Medical Center: 111905902.2.2
- Medical Center of Lewisville: 094192402.2.1

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:

Las Colinas Medical Center defined the population that will be directly impacted by the project as patients with Medicare and all patients who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients

surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 5 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The Medicare average volume per year of 800 cases and rate per Medicare case of $8,654 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY5 -1.5% . This totaled $356,500 for a 5 year period.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $260,245 . To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $ 214,303.

The total value of the project was calculated at $831,048. Approximately 79% of the project value was assigned to the Category 2 project, $657,118 and 21% to the Category 3 project, $173,930.

Rationale/Justification:. The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, cost avoidance, and risk and project scope.

Project Option 2.4.1-Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

Unique Project ID: 094192402.2.1
Performing Provider Name/TPI: Medical Center of Lewisville/094192402

Provider: Medical Center of Lewisville is a 166-bed acute care hospital in Denton County, Texas serving a primary and secondary service population of approximately 350,000.

Intervention(s): This project will create workgroups under a steering committee to implement improvement work on patient experience targets. The goal is to have multiple process improvement events each year from DY 3 through DY 5, at least 2 per year to streamline processes that are not resulting in optimal patient experiences as part of continuous quality improvement. At DY 4 and DY 5, we have routine, formalize updates to employees on the efforts the organization is undertaking to improve the experience of its patients and their families with organizational displays. We expect in DY 4 there are 7 such updates and DY 5, 10 updates.

Need for the project: We currently are below the 75% percentile in Grand Composite Scores for HCAHPS survey. Key scores are include communication with nurses and doctor and communication regarding medications. Effective communication is critical for patient safety and quality of care of patients. Improvement efforts have not made material improvement in score in past 4 quarters.

Target population: The target population is IP, ED and OP patients at the hospital. Approximately 36% of our patients are either Medicaid eligible or indigent. . We estimate an average of 7,600 patients a year or 40,600 over the course of the waiver will be impacted. We do actively survey 100 patients a month/1200 a year

Category 1 or 2 expected patient benefits: The project seeks to improvement in patient satisfaction scores as measured by HCAHPS Grand Composite Scores This will be a benefit to patients from better communication with nurses and doctors , better medication management, pain management and discharge planning. Studies have shown with improved patient experience, the quality of care patients experience also improves. This will result in reduce preventable complications such as infections, less readmissions and reduced medication errors. It is estimated patients impacted will be DY1-7,647, DY 2-7,877, DY 3-8,113, DY 4-8,356, DY5-8,607.

Category 3 outcomes: IT-6.1 Our goal is to improve Percent Improvement over baseline of patient satisfaction scores from 70% currently to 84% by DY5, for a 20% improvement

Project Description

Medical Center of Lewisville is proposing a project to establish baseline Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) scores and implement a patient/family experience strategic plan.

A steering committee will be formed and workgroups of the committee will work on process improvements for patient experience targets. Evaluation will be performed and documented to measure implementation progress, results and make adjustments to improvement plans. As part of the strategic plan, patient experience will be an integral part of employee orientation. A communication plan on work being done to improve the patient experience will be developed and implemented to ensure all employees and physicians are included on progress and initiatives. Studies have shown that improved patient experience can improve patient health outcome and quality.

Goals and Relationship to Regional Goals:

The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose of performing this project is the engage all stakeholder such as leader and employees that can be the high level role to drive the patient experience improvement across the hospital for a cultural change at the organizational level

A major goal of the region is to pursue the triple aim of healthcare by improving patient experience of care, improve health of populations and reduce the cost of healthcare. Redesigning the patient experience at the in the region will impact the health of our community by keeping patients engaged in the healthcare system.

Challenges

The hospital has been participating in HCAHPS to measure patient experiences in a hospital setting. Implemented training plans have not improved scores. Medical Center of Lewisville has achieved Grand Composite score of 70% for 2010 Q3-2011 Q2 and 70% for 2010 Q4-2011Q3, which is consistently been below the CMS National Average. The scores summarize:

- how well nurses and doctors communicate with patients
- how responsive hospital staff are to patients' needs
- how well hospital staff help patients manage pain
- how well the staff communicates with patients about medicines, and whether key information is provided at discharge
- cleanliness and quietness of patients' rooms
- patients' overall rating of the hospital and whether patients' would recommend the hospital to family and friends

The project will address targeted patient experiences with that have not been improved by other initiatives.

5-Year Expected Outcome for Provider and Patients

We expect at end of waiver period we will be > 75th percentile on Grand Composite scores for CMS HCAHPS. The hospital will have improved processes for service that will increase quality and safety of care.

Starting Point/Baseline

Medical Center of Lewisville has achieved Grand Composite scores of 70% in 2010 Q3-2011 Q2 and 70% 2010 Q4-2011 Q3, which has consistently been below the CMS National Average.

Rationale

Patient experience scores are measured internally and reported quarterly from a Gallup Survey. These scores are shared with senior leaders and staff in various manners including Dashboards and reports. Various committees work on departmental and process issues but a coordinated, system wide approach is lacking. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization's resolve to get better and stay better

The overall approach to redesigning patient experience will be centered on cultural change at the organizational level. This will involve clinicians, patients and their families or caregivers. An organizational strategy will be developed so that we manage patient experience and create avenues to implement the strategic plan/vision. This project option is best for organizational integration which is critical to successful patient experiences.

Project Components

All core components will be implemented:

a. Organizational integration and prioritization of patient experience
b. Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c. Implementing processes to improve patient's experience in getting through to the clinical practice;

d. Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Establishing a steering committee with high level leadership is necessary to drive cultural change to impact patient experiences. A communication plan will be developed to inform all employees and physicians of the work of the steering committee and results to better integrate the process and changes into the culture. Process improvements needed will be identified and analyzed with Lean Six Sigma tools. The work groups will be empowered to implement changes identified and report back to the steering committee. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Evaluation, control and sustain activities are necessary for continuous quality improvements. The goal is to have multiple improvement events each year, at least 2 per year. We will measure the impact of the improvements implemented from CMS HCAHPS scores.

Unique Community Need Identification Numbers the Project Addresses

CN.11: Patient Safety and Quality

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This is a new initiative for Medical Center of Lewisville. It currently does not have the structure or feedback this program will implement for patient experience improvement,

Related Category 3 Outcome Measure(s)

IT-6.1: Percent improvement over baseline of patient satisfaction scores will be the focus of the patient satisfaction improvement plan.

An organizational strategy will be developed so that the hospital will better manage patient experiences and create avenues to implement the strategic plan/vision. Performance will be measured, among other factors, by the extent to which patient experience improves systematically.

In October 2005, the Joint Commission's Journal on Quality and Patient Safety published a series of case studies of healthcare institutions' efforts to improve both quality and safety. One of these was from Lehigh Valley Hospital in Allentown, Pennsylvania, which used active engagement of patients and families in attempting to improve patient safety. Anthony, R., Ritter M., Davis, R., Hitchings, K., Capuano, T. A., &Mawji, Z. (2005, October). Lehigh Valley Hospital: engaging patients and families. Joint Commission Journal on Quality and Patient Safety, 31(10), 566-572.

Weingart and colleagues (2006) examined inpatients' reports of service "incidents" — deficiencies in service quality such as waits/delays, poor communication, poor care coordination, lack of respect for personal preferences, or environmental issues. They found that roughly 40% of patients reported at least one incident and that reporting of incidents was associated with diminished patient satisfaction. Weingart, S. N., Pagoviceh, O., Sands, D. Z., Li, J. M., Aronson, M. D., Davis, R. B., Phillips, R. S., & Bates, D. W. (2006, April). Patient-reported service quality on a medicine unit. International Journal of Quality in Health Care, 18(2), 95-101

Also, Kaldenberg and Trucano (2007) examined facility-level relationships between hospital-acquired infection (HAI) rates and patient perceptions of specific aspects of hospital quality in the State of Pennsylvania. Specifically, they chose three questions from an inpatient survey thought to measure practices that, when poorly executed, could create a more infection-prone environment: ratings of cleanliness; of the skill of the person who took the patient's blood; and of nurses' response to the call button. All three were found to be significantly, negatively correlated with HAI rates. Kaldenberg, D. & Trucano, M. (2007, August 22). The relationship between patient perceptions of hospital practices and facility infection rates: Evidence from Pennsylvania hospitals. Patient Safety & Quality Healthcare

Relationship to other projects

This project is to redesign to improve the patient experience. This project supports 094192402.4.3 RD-2 Potentially Preventable Readmissions- 30 days and 094192402.4.4 RD -3 Potentially Preventable Complications. An improved patient experience has been shown to correlate to improved quality of care and safety. This project also support 094192492.4.5 RD-4 Patient-centered healthcare. The project will implement training and improvement work on experience targets aimed to increasing patient satisfaction with the hospital, nurses and physicians that will result in a better patient experience.

Relationship to other Performing Providers' projects and Plan for Learning Collaborative

The following providers are also proposing projects to Redesign to Improve Patient Experience:

Denton Regional Medical Center:	111905902.2.2
Las Colinas Medical Center:	020979301.2.1

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:
Medical Center of Lewisville defined the population that will be directly impacted by the project as patients with Medicare and all patients who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 5 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The Medicare average volume per year of 2,150 cases and rate per Medicare case of $8,634 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY5 -1.5% . This totaled $771,480 for a 5 year period.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $154,296. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $ 149,195.

The total value of the project was calculated at $1,074,974. Approximately 79% of the project value was assigned to the Category 2 project, $849,981 and 21% to the Category 3 project, $224,900.

Rationale/Justification:

The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, cost avoidance, and risk and project scope.

Projection Option 2.8.11- Implement an Innovative and Evidence Based Intervention that will lead to reduction in Sepsis Complications (Apply Process Improvement Methodology to Improve Quality/Efficiency)

Unique Project ID: 094192402.2.2
Performing Provider Name/TPI: Medical Center of Lewisville/ 94192402

Provider: Medical Center of Lewisville is a 166-bed acute care hospital in Denton County, Texas serving a primary and secondary service population of approximately 340,000.

Intervention(s): This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. . Interventions will include implementing houseiwde 12/hour screenings on all patients, ED protocols, ICU Sepsis evidence based care treatment protocols and developing a measurement and reporitng system.

Need for the project: The current diagnosis and treatment of sepsis is not adequate for patient safety and quality of care with mortality as high as 60 % . Complications from lack of timely and appropriate treatment of sepsis including lifetime health issues, disability and mortality puts an unnecessary burden on society and the healthcare system. Process improvement methodologies will facilitate analysis of the evidence based program and implementation of corrective actions to improve implementation and maximize outcomes.

Target population: The target population for diagnosing sepsis arepatients presenting to ED and all patients in house. . By initiating housewide screening every 12 hours on patients , we believe the number of patients diagnosed will increase. Once diagnosed with sepsis hock, severe sepsis, evidence based treatment is necessary. Approximately 49% of patients to be screened are Medicaid and indigent. It is estimated currently 20% of our patients screened and treated for sepsis are Medicaid eligible or indigent. Based on current processes over 465 patients will be treated over course of the waiver, however with improvement in diagnosis a key element of the program, this number is expected to increase to estimated 647 patients over 5 years (DY1-93, DY2-112, DY3-134, DY4-154, DY5-154).Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

Category 1 or 2 expected patient benefits: The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence based care with improve the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with septic shock. We expect to diagnose and treat 647 sepsis patients (estimated at DY 1- 93, DY2-112, DY 3- 134, DY 4- 154,

DY 5-154). 93 patients were diagnosed in DY 1 with the implementation of the sepsis program. However only 81 patients were properly treated with the evidence based care plan from the program. In addition it is estimated based on similar size hospitals with sepsis programs, we should expect to diagnosis 154 patients a year. Potentially we are not properly diagnosing 61 patients a year. Patients that may not diagnosed/diagnosed timely or not receive evidence based treatment may have resulted in death or disability. The program will have great benefit to patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.

Category 3 outcomes: IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis from 30% currently to 20% by DY5. . The estimated DY 1 mortality was 20% and improvement of 20% by DY 5, morality would be 16%
IT -4.9 Our goal is the reduce the Average length of stay of patients with sepsis by 10% in DY 4 and 10 % in DY 5 for a 20% total reduction by DY 5. Estimated DY 1 ALOS was 7 , a reduction goal by DY 5 days to ALOS of 5.5.

Project Description

The project will design and implement a Process Improvement plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles to improve patient outcomes.

Medical Center of Lewisville is committed to continuous quality improvement so all of our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for Emergency Department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes, revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient that screens positive for severe sepsis or septic shock and is hypotensive.

Medical Center of Lewisville will also track primary endpoints of mortality and ICU LOS. Process and other measures will be tracked that include, percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous

renal replacement therapy. Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of Sepsis Resuscitations and Management Bundles are still remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Goals and Relationship to Regional Goals:

The goal of this project is to implement Process Improvement plan to improve safety and quality for those patients with Sepsis. We will:

1) Achieve 95% Compliance with the Sepsis Resuscitation and Management Bundles in patients admitted to the ICU.
2) Substantially improve early sepsis identification, reduce sepsis related Mortality by 20% from baseline.
3) Effective and fully implemented measurement and reporting system supporting compliance with the Sepsis Resuscitation and Management Bundles.
4) Continue to work with Emergency Medical Services to improve the delivery of care provided to patients with suspected infection.
5) Improve identification of sepsis patients' house wide by implementing nursing admission screening and shift assessments for sepsis screening.
6) Improve identification of sepsis, compliance from TBD with current Sepsis Resuscitation and Management Bundles in the Emergency Department.

This project supports the regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of post hospital care in addition to quality-adjusted life gained

Challenges

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe

sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the contributing factors contributing to the design of evidenced based standardized care sets and subsequent adoption of those tools will aid greatly to reducing variation and associated cost. Early recognition and management of sepsis results in lives saved.

5-Year Expected Outcome for Provider and Patients

We expect to reach 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate>4mmol/L (36mg/dl). We also expect to be at 95% compliance with application of the Sepsis Bundles for patients that meet specified criteria.

Starting Point/Baseline

. The number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would be 154 per year for a total of 647 patients over course of the waiver. The hospital only diagnosed 93 patients in DY 1. Of those patients diagnosed only 81 received evidenced based care for sepsis bundles. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012. Early data collection indicates compliance with sepsis bundles is a low as 79%.It is expected that the morality rate for this population in DY 2 will initially increase compared to DY 1 due to more patients being correctly diagnosed with new sepsis protocols thus a baseline will be established in DY2 to measure same mortality based on same standards of care. The same is true for average length of stay, although it may decrease rather than increase. A baseline in DY 2 is necessary to measure patients receiving the same protocol based diagnosis and standard of care.

Rationale

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Project Options

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS which has improved. Although program components have been implemented and put in place, we still face the challenge of successful implementation. Also, additional interventions will be implemented in the future (shift assessments on all in-house patients etc.). To be successful we need to work on processes that create time delays, non-adherence to order set and, failure to identify/diagnose sepsis. We are at 80% compliance in implementing Sepsis Bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

Project Components

The project components to report metrics for Sepsis Mortality and Average Length of Stay are necessary to measure the success of implementing the Sepsis Improvement Plan.

A Sepsis Improvement Plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, Inpatient Units, and EMS etc), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay compliance with Sepsis diagnosis and protocols for Sepsis Bundles are critical. In implementation of a plan, it is necessary to examine the plan as it is implemented, understand what is working and what is not, identify barriers and make corrective action. . Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvemen

Unique Community Need Identification Numbers the Project Addresses

This project addresses identification number CN.11 Patient Safety and Quality from the community needs assessment. The program will improve the health outcomes for patients diagnosed with severe sepsis or sepsis shock.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Applying process improvement methodologies to the Sepsis program will greatly enhance the chances of being success in implementing the plan and seeing reductions in mortality and average length of stay for improved health outcomes.

Related Category 3 Outcome Measure(s):

- IT-4.8 Sepsis mortality
- IT-4.9 Average length of stay

Applying process improvement methodologies to Sepsis programs will greatly enhance the chances of being successful in implementing the plan and seeing a reduction in mortality and average length of stay. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis: Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Relationship to other projects

This project supports the population focused improvements 094192402.4.4 RD-3 Potentially Preventable Complications (PPCs) and 094192402.4.6 RD- 5 Emergency Department. Improved quality with evidence based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting and ED care and treatment decisions.

Related Category 4 Population-focused improvements

- RD-3: Potentially Preventable Complications
- RD-5: Emergency Department

Relationship to other Performing Providers and Plan for Learning Collaboratives

The following providers are also proposing projects to address Sepsis Resuscitation and Management improvement:

Denton Regional Medical Center:	111905902.2.1
Medical City Dallas:	020943901.2.3
Medical Center of Lewisville:	094192402.2.3
Parkland Health & Hospital System:	127295703.2.6

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:
Medical Center of Lewisville Center defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The population expected to be positively impacted by the project for mortality was 647 which was determined based on outcome target for reduction in mortality by 20% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 17 . The estimated pricing for morality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages , and quality of life. This totaled approximately $198,129 for 5 years.
The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay by 20% from baseline average of 7 days per patient. This was estimated at total of reduced in patient days by DY 5 of 647. The estimated cost per day for a sepsis patient is $930. This totaled approximately $751,905.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $177,100.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 4. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $601,524.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.
This value was estimated as a proportion of mortality reduction at $177,100.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.
This value was estimated as a proportion of length of stay reduction at $526,333.

The total value of the project then was estimated at $2,431,091. Approximately 79.1% of the total value was assigned to Category 2 project ($1,923,053) and the remaining 10.46% of value assigned to Category 3 outcome for Sepsis Mortality ($254,518) and 10.46% assigned to Category 3 outcome for reduced Average Length of Stay ($254,520).

Rationale/Justification: The outcome improvement targets are dependent on the target population served (sepsis patients have increased rates of mortality), size, and also current processes in place that already treat Sepsis.

Community benefits were calculated using the following factors: lost productivity (net of lost wages), worker presenteeism, lost in payroll taxes and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, and risk and project scope.

Project Option 2.9.1- Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Establish a Patient Care Navigation Program for ED Patients)

Unique Project ID: 094192402.2.3
Performing Provide Name/TPI: Medical Center of Lewisville/ 94192402

Provider: Medical Center of Lewisville is a 166-bed acute care hospital in Denton County, Texas serving a primary and secondary service population of approximately 340,000.

Intervention(s): This project will implement a Patient Navigation program to assist patients with health literacy and education, psychosocial support, and self-management education and support. The program will assist patient in obtaining primary care and other services for their medical care.

Need for the project: Currently over 50% of patients seen in the ED are Medicaid eligible or uninsured. Due to lack of resources, cultural barriers and fragmented system, medical care is utilized in ED in an episodic manner. The program will provide, case management, health literacy and education, psychosocial support, and self-management education and support assist patient in obtaining appropriate care in the right setting.

Target population: The target population is patients presenting to ED who are Medicaid eligible or uninsured who do not have access to appropriate medical care services. Approximately 53% of patients in the ED are Medicaid and indigent. There are an estimated 2000 patients who visit the ED more than 3 times year and 1300 patients who visit ED more than 4 times a year. Patients with visits > 4 times a year had an average of 5.77 visits per year. 47% of the patients with visits > 4 times in year were Medicaid eligible or indigent. The target population are those patients utilizing ED >4 times a year particularly those with visits >10 visits and those with chronic diseases. These are the goals for the number of patients the patient navigation program will serve- DY2-195, DY3- 325, DY4- 585 and DY5- 845 for a total of 1,950 patients.

Category 1 or 2 expected patient benefits: The project seeks to provide navigation services to patient who frequent the Emergency room services .Patient will be given access to support services such as ,assistance with transporation, language assistance, medication management and disease and health education. Interventions will be designed to assist patients to be compliant and successful in manageing their health. Patients with visits > 4 times a year had an average of 5.77 visits per year.The goal of navigation program will be the reduce the visit to average of 2 per year. It is reasonable to expect some ED visits from the target population due to chronic diseases, but a reduction is possible with primary care referrals and navigation interventions.
Category 3 outcomes: IT-4.8 Our goal is to reduce their inappropriate ED visits of the target population enrolled in navigation by 65 % by DY5 It is estimated the ED visits by target population if continued at 5.77 per year are DY3-1,875 DY4-3,375 DY5-4,876. With an effective

patient navigation program we anticpate the ED visits from patients in the patient navigation program will be reduced to DY3, -650, DY4-1,170 DY5-1,690, a reduction of 6,616 visits. The overall ED visits baseline is 43,000 visits per year, a reduction of 6,616 is an overall reduction in ED visits of 15% by DY 5,(DY3-3%, DY4 -5%, DY5-7%).

Project Description

As many providers in Dallas Fort Worth, Medical Center of Lewisville sees high utilize patients in the ED and acute care services many with chronic diseases that resources or knowledge of healthcare systems and often with mental and behavioral health issues. Medical Center of Lewisville will implement patient care navigation as it has been established as a best practice to improve the care of populations at high risk of being disconnected from health care institutions The program will includes patient assessment, case management, health literacy and education, psychosocial support, and self-management education and support. With greater support and access to services, patients will utilize appropriate care services in the appropriate setting while reducing ED visits. With a reduction in inappropriate ED visits, hospitals will create capacity to better service those in need of true emergency services and allow for improved emergency care.

Goals and Relationship to Regional Goals

The goal of this project is to develop patient care navigation program to assist and coordinate with patients to find appropriate care and services needed. Patients find it difficult to obtain appropriate care which can be due to lack of health literacy, cultural barriers, lack of financial resources and fragmented systems. With assigning a health professional to a patient, achieving goals will be easier and more successful for patients in utilizing appropriate services and not rely on Emergency room for care. Because patients cannot access other services, they with often wait and at last minute with health issue exacerbated, go to ED when possible health outcome could have been avoided or lessened.

A major goal of the region is to pursue the triple aim of healthcare by improving patient experience of care, improve health of populations and reduce the cost of healthcare. Assisting patients to obtain health services in an appropriate setting will impact the health of our community by improving care received in a cost effective manner.

Challenges

Patient also routinely us ED as primary care but such expensive do not need such tertiary services as the ED is not meant to be a medical home. The best care is not delivered in this episodic manner. Our goal is to give patients the opportunity to access other services, reduce ED visits and better health outcomes for patients.

A major challenge will be the thoughtful and careful redesign of care delivery and communications processes resulting in a team approach to patient/family centered care, requiring a formally

structured, inclusive project management approach. This project will use proven process improvement methodologies to guide the redesign as well as use "lessons learned" from providers who have successfully redesigned care delivery in their practices. Additional challenges will include the acquisition of professional resources that have a background and training to provide social services and navigation care services, as well as overcoming the reliance on personal accountability of the patient to follow up with a provider in a more appropriate care setting.

5-Year Expected Outcome for Provider and Patients

At the end of the waiver, we expect to see utilization in ED decrease 65% for those patients use ED > 4 times a year as patients will access to appropriate in appropriate setting.

Starting Point/Baseline

Over use of the Emergency department services in the region rate of 447.5 visits per 1000 persons compared to national rate of 390.5 per 1000 persons in 2007. At Medical Center of Lewisville annually we see over 43,000 patients visits. In 2011, 1300 patients use the ED > 4 times in 12 month cycle and 2000 > 3 times. Although most patients presenting to ED need care, the appropriate setting for care needed /level of care may not be an Emergency room.

Emergency rooms become the safety net for individuals to seek healthcare with additional need including mental health services and social care needs. However emergency departments are not always equipped to properly coordinate with these patients seeking these services. Although many other organization exist in the community (churches, state and local agencies, and charitable organizations) finding these services can be difficult.

Navigation programs can screen patients and assess patients' risk of failure to meet healthcare goals. The program can develop an individual plan to best meet the needs of particular patient rather than a generalized discharge –for- all plans. Patients with individualized plans and support will have better results in achieving health outcomes and self- management goals.

Medical Center of Lewisville has seen increase in ED visits in to 43,000 a year, an annual increase of 13% in 2011. In 2011, 1300unique patients utilized the ED 4 times or greater with average visit count of 5.77 in the 12 month period and as many as 30 visits per patient There are an estimated 2000 patients who visit ED more than 3 times year and 1300 patients who visit ED more than 4 times a year. Patients with visits > 4 times a year had an average of 5.77 visits per year. 47% of the patients with visits > 4 times in year were Medicaid eligible or indigent. The target population are those patients utilizing ED >4 times a year particularly those with visits >10 visits and those with chronic diseases. These are the goals for the number of patients the patient navigation program will serve- DY2-195, DY3- 325, DY4- 585 and DY5- 845 for a total of 1,950 patients.

Rationale

Medical Center of Lewisville as seen an increase in ED visits in past 3 years average over 5% to 43,000 visits. Medical Center of Lewisville has initiatives in place in the ED to triage patients for urgent care and system wide ED throughput program. Although these initiatives continue to be successful, we continue to see increases in ED utilization particularly by frequent fliers. This project would an additive phase to the overall ED management initiative that would have 2 purposes. A navigation program serves patients by assisting them to obtain care in the appropriate setting and appropriate time in addition to better care for those patients truly in need of Emergency care services.

Project Components

This project will address the core components:
Identify frequent ED users and use navigators as part of a preventable ED reduction program.
Train health care navigators in cultural competency.
Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
Connect patients to primary and preventive care.
Increase access to care management and/or chronic care management, including education in chronic disease self-management.
Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

The milestones and metrics that we chose are directly related to two of the goals identified by the region: 1) need for more care coordination and 2) overuse of ED servicesThe metrics we have in place increase the number of the target population served over the Waiver period and emphasize the connection rate to a primary care for those without access. In addition, we have added a metric that creates regular reports that show comparative analyses year over year of the program. We believe by running detailed reports on what services were provided and how these coincide with the needs of the community, will allow for maximum effectiveness and positive outcomes of the project. These metrics directly impact the health and well-being of the patients served and ensures continuity in their care.

Unique Community Need Identification Numbers the Project Addresses

This project addresses the community need - CN.12 Emergency Department Usage and Readmissions.

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

We currently utilize Case Managers for ED patients however their roles as evolved to prioritize ED throughput and admissions. Case Managers do make referrals for care however they are not onsite 24/7 and do not have interaction with patients once they leave the ED. This initiative would add resources that can devote time to assisting patients with finding resources such as medical homes, support organizations and health education. The follow up with patients would be entirely new components to case managing in the ED.

Related Category 3 Outcome Measure(s):
IT-9.2 ED appropriate utilization (Standalone measure)

The outcome measure for IT-9.2 ED appropriate utilization (Standalone measure) was selected to reflect the impact of the navigation program and interventions on the on ED usage in the region as this a priority goal for the program. Patient navigators will provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services including assisting in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations.

Relationship to other projects
This project supports the focused improvement of 094192402.4.2 RD-1 Potentially Preventable Admission and 094192402.4.3 RD-2 30 day re-admission. By helping patients navigated the continuum of the health system and connecting them to primary and preventative care, patients will get care needed in the right setting. Patients will also benefit from the enhanced social support for their needs from culturally competent navigators. There is less risk of hospitalization if patients are able to access appropriate care and services.

Relationship to other Performing Providers and Plan for Learning Collaborative

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:

Medical Center of Lewisville recognized that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, the project and outcomes was computed with a total value of the Category 3 outcomes connected to each project. Medical Center of Lewisville estimated the ED visits by target population if continued at 5.77 per year are DY3-1,875 DY4-3,375 DY5-4,876. With an effective patient navigation program we anticipate the ED visits from patients in the patient navigation program will be reduced to DY3, -650, DY4-1,170 DY5-1,690, a reduction of 6,616 visits. DY3, -650, DY4-1,170 DY5-1,690, a reduction of 6,616 visits. The average, direct cost of an ED visit from internal cost information is $250 per visit so for DY 3-5 cost saved would be $1,654,300. The patient navigation program, 4 year costs for the waiver period were estimated at $704,000. This cost included direct staff hired to run the navigation program (1-2 RN/case managers) and 10% overhead for management time and additional costs (transportation, interpreters, etc.). The total net value was $950,300 ($1,654,300 less $704,000). Approximately 79.06% of the total value was assigned to Category 2 project ($751,402) and the remaining 20.93% of value assigned to Category 3 outcome for reduction of ED visits ($198,898).

Rationale/Justification: The outcome improvement targets are dependent on the target population served size and also processes to be put in place to achieve the target. .

Project Option 2.15.1 – Integrate Primary and Behavioral Health care Services (Integrate Primary Care with Psychiatric Care Clinic)

Unique Project ID: 020943901.2.1
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas, Texas serving a Primary and Secondary Service Area population of approximately 3.2 million.

Intervention(s): An integrated primary and behavioral health clinic will provide primary care for patients receiving OP psychiatric care at Green Oaks Hospital

Need for the project: Psychiatric disorders often have co-occurring medical issues and/or chronic disease. Community need assessment conducted for Region 9, noted the high rate of co-occurring mental and behavioral health in patients in ED. Despite the strong relationship between behavioral health and medical illness related outcomes and cost the percentage of the 200% FPL population receiving behavioral healthcare in primary care settings is below the national average in Dallas County (19.8% vs. 37.1%). Two thirds of the Indigent patients treated in NorthSTAR region are not eligible for Medicaid and lack access to primary care.

Target population: Our target population is will be those Medicaid and uninsured patients being treated for psychiatric care with known chronic diseases and medical health issues. Approximately 100% of patients are Medicaid eligible and indigent. It is estimated there are 10,000 psychiatric patients without access to primary care in the target population of psychiatric patients at Green Oaks Hospital. We estimate 50% have a chronic disease and 50% of chronic disease patients are not able to access primary care via hospital district (Parkland) or self insured funding.

Category 1 or 2 expected patient benefits: The project seeks to provide access to primary care for patients who currently do not have access and integrate psychiatric and medical care in a collaborative model. We estimated to have 50% of psychiatric patients with chronic disease without primary care access as patients in the new collaborative model (DY2-500, DY3-1,500, DY4-2,000 and DY5-2,500).

Category 3 outcomes: IT-2.4 Our goal is to reduce Behavioral Health/Substance Abuse (BH/SA) admission rate .5. We estimate admit rate for the target population to be 35%. Our goals is to reduce these admission by 10% per year from DY 2-DY5 for a total admission reduction of 230. We estimate the current region Behavioral Health/Substance Adbuse Admission rate to be .505%. We aim to reduce the rate by 1.3% by DY 5.
IT-3.8 Our goal is to reduce to reduce Behavioral Health/Substance Abuse (BH/SA) 30 day readmission rate by DY3-5%, DY4-5%and DY 5-10% for a total reduction of 20%. (DY3-40 DY4-40, DY5-81).

Project Description

This project will improve access to primary care through a collaborative integrated primary and behavioral health clinic. The integrated primary and behavioral health clinic will provide primary care for patients receiving OP psychiatric care at Green Oaks Hospital. Patients who are under the care of a psychiatrist at Green Oaks Hospital are evaluated for medication checks on an outpatient basis. The same clinic site will add an Internal Medicine physician to serve as a cohesive team to provide primary care services. Medical City Dallas will partner with Green Oaks Hospital to provide primary care at the clinic.

The team of psychiatrists and Internal medicine physicians will provide comprehensive care to NorthSTAR patients in the region. Many of these patients' are not able to access primary care as they do not have medical care coverage. Approximately two thirds of the patients seen at Medical City Dallas and Green Oaks from North STAR are indigent but do not qualify for Medicaid. This project will provide primary care to those who are not able to afford care in addition to integrating the patients' primary care with behavioral care. Patients who do have coverage for medical care through Medicaid or other insurance will also be eligible to use primary services at the clinic if they choose to do so.

In analyzing the prior 12 months of patients seen at Green Oaks, we have measured the prevalence of co-occurring health conditions with 10% of patients being diabetic, 20% having GI issues, and 14% with neurological issues. Cardiovascular disease was most prevalent with 40% of patients having cardiac problems. Medications for psychiatric care are known to exacerbate the problem as they are associated with obesity and high triglyceride levels, known risk factors for cardiovascular disease.
By addressing these health issues and chronic diseases, the clinic will be addressing the whole person to improve the continuity of care and result in better outcomes.

Our target population is will be those uninsured patients with known chronic diseases and medical health issues. The psychiatric and medical providers in the clinic will be on a common platform to share scheduling and medical records. Regular face- to-face communications will assist to facilitate a close collaboration among the providers Protocols, training and team building will be developed to ensure co-location is successful.

Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through the multidisciplinary teams.

Goals and Relationship to Regional Goals

The goal of this project: is to:

1. Provided primary care to patients under psychiatric care
2. Minimize the need for multiple sites and multiple providers for psychiatric patients for their care

3. Integrate the medical and psychiatric care for patients to achieve a collaborative model
4. Improve the health outcomes of psychiatric patients

This project addresses the regional goal to provide improved primary and behavioral health care to transform delivery of health care, improve patient health outcomes and reduce cost per capita. The purpose of this project is to reduce complications in psychiatric patients by addressing their chronic disease and health issues. With reduced complications we believe we have a greater chance to be successful in treating psychiatric disease. We believe with a focus in primary care there will reduce ED visits, admissions and re-admissions.

Challenge

Psychiatric patients often have medical issues that are not receiving treatment. There are various reasons for this lack of treatment including lack of medical coverage, lack of transportation, lack of support system, and inability to manage their care and lifestyle choices. In order to have the best chance of success in treating the whole person, integrating primary care with the psychiatric care will address both issues for continuity of a care and better health outcomes.

5-Year Expected Outcome for Provider and Patients

We expect to have 2500 unique patients by DY 5 andexpect to see over 16,250patient visits in integrated primary behavioral care clinic by the end of the waiver.

Starting Point/Baseline

The number of patients without access to primary care is not known. This will be measured as a baseline in DY 2. It is estimated that the number of patients being treated at Green Oaks in 2011 who do not have access to primary care is 10,000 and greater than 50% have a medical/chronic disease issue.

Rationale

Psychiatric disorders often have co-occurring medical issues and/or chronic disease. Community need assessment conducted for Region 9, noted the high rate of co-occurring mental and behavioral health in patients in ED. Despite the strong relationship between behavioral health and medical illness related outcomes and cost the percentage of the 200% FPL population receiving behavioral healthcare in primary care settings is below the national average in Dallas County (19.8% vs. 37.1%) The assessment also noted the mortality disparity of those patients with mental illness as the majority of premature deaths were attributed medical illnesses.

Nationally, patients with serious mental disorders often do not receive treatment for medical or physical issues. A review of 18 studies estimated that, on average, 35% of individuals with serious mental disorders have at least one undiagnosed medical disorder. Among people with

schizophrenia, fewer than 70% of those with co-occurring physical problems were currently receiving treatment for 10 of 12 physical health conditions studied.

Project Option

One way to improve primary care in these patients is to bring primary care services into psychiatric care settings.[315] Patients with schizophrenia may be a population that would benefit from integrated psychiatric and primary care because these patients generally use the mental health care as the main source of health care.[316] Patients with chronic psychiatric disorders other than schizophrenia also use the mental health care sector as a source of care, have co-occurring non psychiatric disorders, and could also benefit from integrated primary and psychiatric care.

Patients are more likely to make a primary care visit if it at same time and /or site of psychiatric care. By integrating primary and behavioral health care, patients will have their psychiatric and medical care addressed at the same site by providers who will coordinate their care. Placing primary care physicians in psychiatry settings improves health maintenance, care coordination, and satisfaction with medical care.

Providers will:

- Share medical records and knowledge of medical and psychiatric history and treatment
- Communicate face-to-face to on patient care
- Build a shared culture of treatment to include protocols and methods for information sharing
- Track treatment utilization and health outcome of integrated model

Project Components

All components of this project will be implemented to allow for a robust and successful project. They include:

a. Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. Examples of selection criteria could include proximity/accessibility to target population, physical plant conducive to provider interaction; ability / willingness to integrate and share data electronically; receptivity to integrated team approach.

b. Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated.

[315] Wulsin LR, Söllner W, Pincus HA. Models of integrated care. Med Clin North Am. 2006;90(4):647–677. [PubMed]
[316] Horvitz-Lennon M, Kilbourne AM, Pincus HA. From silos to bridges: meeting the general health care needs of adults with severe mental illnesses. Health Aff (Millwood) 2006;25(3):659–669. [PubMed]

c. Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers

d. Recruit a number of specialty providers (physical health, mental health, substance abuse, etc. to provide services in the specified locations.

e. Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:

- Regular consultative meetings between physical health and behavioral health practitioners Case conferences on an individualized as-needed basis to discuss
- individuals served by both types of practitioners; and/or
- Shared treatment plans co-developed by both physical health and behavioral health practitioners

f. Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in a health information exchange – depending on the size and scope of the local project.

g. Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice.

h. Arrange for utilities and building services for these settings

i. Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.

j. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

A plan for Integrating Primary Care with Psychiatric services will need to be developed. It will be necessary to establish the baseline of actual number of patients that do not have a primary care provider so we are able measure capacity needed and progress in improving the primary care access. The goals of the project extend beyond only providing primary care as integration is essential to success. Establishing protocols for referrals and the analyzing referrals will be necessary as guidelines for practitioners and measurement of the effectiveness of the co-

location. Of course co-location is only one part of the program with true integration as ultimate goal. To measure integration, standards will be used for to ensure effective information sharing and proper handling of referrals of psychiatric patients to primary care provider. Continuous quality improvement activities will be utilized ensure successful implementation.
The program will measure the number of patients receiving their primary care at the co-located site to ensure capacity is utilized and goal of program is met. The no show rate will also be monitored to know if patients are able to keep appointment and put in place interventions to increase rate of compliance with appointments and their psychiatric and medical care plan

Unique community need identification numbers the project addresses:

- CN.5 Behavioral Health
- CN.6 Behavioral Health and Primary Care
- CN.12 Emergency Department Usage and Readmissions

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Green Oaks Hospital is an inpatient psychiatric acute provider in Dallas, Texas and part of the NorthSTAR provider network. The NorthSTAR Behavioral Health program has been jointly administered by the Texas Department of Mental Health and Mental Retardation (TDMHMR) and the Texas Commission on Alcohol and Drug Abuse (TCADA) as a 1915(b) Medicaid Waiver program in a seven-county area around Dallas. The program serves the medically indigent and most Medicaid recipients who reside within this region.

This is a new initiative for Medical City Dallas and Green Oaks Hospital. Green Oaks Hospital currently does not provide primary medical care for psychiatric patients. This project is not funded by NorthSTAR Value Options Behavioral Health program.

Related Category 3 Outcome Measures

- IT-2.4 Behavioral Health/Substance Abuse (BH/SA) Admission Rate
- IT-3.8 Behavioral Health/Substance Abuse 30 day readmission rate

Due to lack of access primary care, patients' medical issues often go untreated. By giving psychiatric patients access to primary care, patients can get appropriate treatment and level of care necessary for medical issues and reduce the risk of admission or readmission. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Relationship to other projects

This project supports the population focused improvements 020943901.4.2 RD-1 Potentially Preventable Admissions and 020943901.4.3 RD-2 Potentially Preventable 30-Day readmissions with evidence based care primary and behavioral care integration for psychiatric patients will reduce risk of patients needing hospitalization for acute medical needs.

Related Category 4 Population-focused improvements:

RD-1 PPA – 3. Behavioral Health and Substance Abuse
RD-2 PRR – 3. Behavioral Health and Substance Abuse
RD-5 Emergency Department

Relationship to other Performing Providers' Projects and Plan for Learning Collaboratives
The following providers are also proposing projects to address integrated primary and behavioral health services:

- Children's Medical Center: 138910807.1.4
- Denton County MHMR Center 135234606.2.2
- Dallas County MHMR dba Metrocare: 137252607.2.1

Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:
Medical City Dallas defined the population that will be directly impacted by the project as patients receive a primacy care medical home at the integrated primary care and behavioral care clinic.. The population expected to be positively impacted by the project for primary care and medical home is 2,500 patients by DY 5. The estimated pricing for medical home was $650 per year per patient. This value was obtained from averages of various PCMH studies (Intermountain Healthcare, Blue Cross Blue Shield, etc.) The value is based on investing in primary care patient centered medical homes resulting in improved quality of care and patient experiences and costs compared to non-PCMH patients and reductions in expensive hospital and emergency department utilization. This totaled approximately $4,225,000 for 5 years.
The population expected to be positively impacted by the project for reduction in Behavior Health/Substance Abuse admission rate and Behavior Health/Substance Abuse Readmission rate by DY 5. The estimated cost for a Behavior Health/Substance abuse admission from

internal data is $1878. A reduction of 230 admissions was valued at $431,940. A reduction of 161 readmissions was valued at $302,358. This totaled approximately $734,298.

The remainder of $53,125 for total value was reduced to balance total funding.
The total value of the project then was estimated at $4,906,173. Approximately 80.63% of the total value was assigned to Category 2 project ($3,901,150). The remaining 10.24% of value was assigned to Category 3 outcome for Behavior Health/Substance Abuse Admission Rate ($502,512) and 10.24% of value was assigned to Cat 3 outcome for Behavior/Substance Abuse Re-Admission-30day ($502,511).

Rationale/Justification:

The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed (Internal Medicine physician, clinic space, staff, IT, etc.), timelines, and risk and project scope.

Projection Option 2.8.11- Implement an Innovative and Evidence Based Intervention that will lead to reduction in Sepsis Complications (Apply Process Improvement Methodology to Improve Quality/Efficiency)

Unique Project ID: 020943901.2.3
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas, Texas serving a Primary and Secondary Service Area population of approximately 3.2 million.

Intervention(s): This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. Interventions will include implementing houseiwde 12/hour screenings on all patients, ED protocols, ICU Sepsis evidence based care treatment protocols and developing a measurement and reporitng system.

Need for the project: The current diagnosis and treatment of sepsis is not adequate for patient safety and quality of care with mortality as high as 60 % . Complications from lack of timely and appropriate treatment of sepsis including lifetime health issues, disability and mortality puts an unnecessary burden on society and the healthcare system. Process improvement methodologies will facilitate analysis of the evidence based program and implementation of corrective actions to improve implementation and maximize outcomes.

Target population: . The target population for diagnosing sepsis arepatients presenting to ED and all patients in house. . By initiating housewide screening every 12 hours on patients , we believe the number of patients diagnosed will increase. Once diagnosed with sepsis hock, severe sepsis, evidence based treatment is necessary Approximately 32% of patients to be screened are Medicaid and indigent. It is estimated currently 18% of our patients screened and treated for sepsis are Medicaid eligible or indigent. Based on current processes over 740 patients will be treated over course of the waiver, however with improvement in diagnosis a key element of the program, this number is expected to increase to estimated 1393 patients over 5 years Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

Category 1 or 2 expected patient benefits: The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence based care with improved the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with severe sepsis and septic shock. . We expect to diagnose and treat 1393 sepsis patients (estimated at DY 1- 148, DY2-222, DY 3- 278, DY 4-347, DY 5-400). 148 patients were diagnosed in DY 1 with the implementation of the sepsis program. However only 33 patients were properly treated with the evidence based care plan from the program. In addition it is estimated based on similar size hospitals with sepsis programs, we should expect to diagnosis 400 patients a year. Potentially

we are not properly diagnosing 300 patients a year. Patients that may not diagnosed/diagnosed timely or not receive evidence based treatment may have resulted in death or disability. The program will have great benefit to patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.

Category 3 outcomes: IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis from 24% currently to 20% by DY5. The estimated DY 1 mortality was 24% and improvement of 20% by DY 5, morality would be 20%
IT -4.9 Our goal is the reduce the Average length of stay of patients with sepsis by 10% in DY 4 and 20 % in DY 5. Estimated DY 1 ALOS was 10.0 , a reduction goal by DY 5 of 2 days to ALOS of 8.0.

Project Description

The project will design and implement a Process Improvement plan to increase the utilization and compliance with Sepsis Resuscitation and Management Bundles to improve patient outcomes.

Medical City Dallas is committed to continuous quality improvement so all of our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for Emergency Department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes, revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient that screens positive for severe sepsis or septic shock and is hypotensive.

Medical City Dallas will also track primary endpoints of mortality and ICU LOS. Process and other measures will be tracked that include, percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous renal replacement therapy.

Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of Sepsis Resuscitations and Management Bundles are still remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Goals and Relationship to Regional Goals

The goal of this project is to implement Process Improvement plan to improve safety and quality for those patients with Sepsis. We will:

1. Achieve 90%Compliance with the Sepsis Resuscitation and Management Bundles in patients admitted to the ICU.
2. Substantially improve early sepsis identification, reduce sepsis related Mortality by 20% from baseline
3. Effective and fully implemented measurement and reporting system supporting compliance with the Sepsis Resuscitation and Management Bundles.
4. Continue to work with Emergency Medical Services to improve the delivery of care provided to patients with suspected infection
5. Improve identification of sepsis patients' house wide by implementing nursing admission screening and shift assessments for sepsis screening
6. Improve identification of sepsis, compliance from TBD with current Sepsis Resuscitation and Management Bundles in the Emergency Department.

This project supports the regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of post hospital care in addition to quality-adjusted life gained

Challenges

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the contributing factors contributing to the design of evidenced based standardized care sets and subsequent adoption of those tools will contribute greatly to reducing variation and associated cost. Early recognition and management of sepsis results in lives saved.

5-Year Expected Outcome for Provider and Patients

We expect to each 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate>4mmol/L (36mg/dl). We also expect to be 90% compliance with application of the Sepsis Bundles for patients that meet specified criteria.

Starting Point/Baseline

. The number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would be 400 per year for a total of 1393 patient over course of the waiver. The hospital only diagnosed 148 patients in DY 1. Of those patients diagnosed only 33 received evidenced based care for sepsis bundles. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012. Early data collection indicates compliance with sepsis bundles is a low as 3%. It is expected that the morality rate for this population in DY 2 will initially increase compared to DY 1 due to more patients being correctly diagnosed with new sepsis protocols thus a baseline will be established in DY2 to measure same mortality based on same standards of care. The same is true for average length of stay, although it may decrease rather tha increase. A baseline in DY 2 is necessary to measure patients receiving the same protocol based diagnosis and standard of care.

Rationale

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS which has improved. Although program components have been implemented and put in place, we still face the challenge of successful implementation. Also, additional interventions will be implemented in the future (shift assessments on all in-house patients etc). To be successful we need to work on processes that create time delays, non-adherence to order set and, failure to identify/diagnose

sepsis. We are at 22% compliance in implementing Sepsis Bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

Project Components

The project components to report metrics for Sepsis Mortality and Average Length of Stay are necessary to measure the success of implementing the Sepsis Improvement Plan.

A Sepsis Improvement Plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, Inpatient Units, and EMS etc.), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay compliance with Sepsis diagnosis and protocols for Sepsis Bundles are critical. In implementation of a plan, it is necessary to examine the plan as it is implemented, understand what is working and what is not, identify barriers and make corrective action. Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvement.

Unique Community Need Identification Numbers the Project Addresses

CN.11 Patient Safety and Quality

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Applying process improvement methodologies to the Sepsis program will greatly enhance the chances of being success in implementing the plan and seeing reduction in mortality and average length of stay.

Related Category 3 Outcome Measures

Applying process improvement methodologies to Sepsis programs will greatly enhance the chances of being success in implementing the plan and seeing reduction in mortality and average length of stay.

IT-4.8 Sepsis mortality
IT-4.9 Average length of stay

We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis: Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Relationship to other projects

This project supports the population focused improvements 020943901.4.4 RD-3 Potentially Preventable Complications (PPCs) and 020943901.4.6 RD- 5 Emergency Department. Improved quality with evidence based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting and ED care and treatment decisions.

Related Category 4 Population-focused improvements

This project supports the population focused improvements 094192402.4.4 RD-3 Potentially Preventable Complications (PPCs) and 094192402.4.6 RD- 5 Emergency Department. Improved quality with evidence based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting and ED care and treatment decisions.

Relationship to other Performing Providers and Plan for Learning Collaboratives

The following providers are also proposing projects to address Sepsis Resuscitation and Management improvement:

Denton Regional Medical Center (HCA): 111905902.2.1
Medical Center of Lewisville (HCA): 094192402.2.3

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology:

Medical City Dallas defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The population expected to be positively impacted by the project for mortality was 1,393 which was determined based on outcome target for reduction in mortality by 20% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 50. The estimated pricing for morality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages , and quality of life. This totaled approximately $740,000 for 5 years.

The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 10 days per patient. This was estimated at total of reduced in patient days by DY 5 of 888. The estimated cost per day for a sepsis patient is $1,055. This totaled approximately $1,171,050 ($234,040 average per year).

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $740,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 3. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $702,630.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.

This value was estimated as a proportion of mortality reduction at $716,847.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.

This value was estimated as a proportion of length of stay reduction at $585,525.

The total value of the project then was estimated at $4,656,052. Approximately 80.64% of the total value was assigned to Category 2 project ($3,753,964)and the remaining 9.68% of value assigned to Category 3 outcome for Sepsis Mortality ($451,044) and 9.68% assigned to Category 3 outcome for reduced Average Length of Stay ($451,044).

Rationale/Justification: The outcome improvement targets are dependent on the target population served (sepsis patients have increased rates of mortality), size, and also current processes in place that already treat Sepsis.

Community benefits were calculated using the following factors: lost productivity (net of lost wages), worker presenteeism, lost in payroll taxes and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

The economic value of each targeted improvement outcome from evidence based studies was used a guide for the overall value of project. Additional value was considered for resource investments needed, timelines, and risk and project scope.

Project Option 2.1.1- Enhance/Expand Medical Homes at Metrocrest Clinic

Unique Project ID: 020943901.2.4 (Pass 2)
Performing Provider Name/TPI: Medical City Dallas/020943901

Provider: Medical City Dallas is a 586 -bed acute care hospital in Dallas, Texas serving a Primary and Secondary Service Area population of approximately 3.2 million.

Intervention(s): This project will enhance the operations of the Metrocrest Medical Clinic to be a medical home provider for indigent patients.

Need for the project: The clinic has operated as a primarily volunteer staffed clinic with limited full time personnel and stable medical services. By enhancing the clinic with stable provider hours and services, we will expand and enhance the clinic operations to provide a medical home services to patients.

Target population: The target population is patients seeking medical care at Metrocrest Clinic. Approximately 100% of the patients seen are either Medicaid eligible or indigent.

Category 1 or 2 expected patient benefits: The project will improve the number of patients assigned to a medical home to 80%. It is expected that total patients will increase from 1500 to 2600 over the course of the waiver (DY1-1500, DY2-1725, DY3-1980, DY4-2280, DY5-2600). We expect by the end of the waiver 96% of new patients will be assigned a medical home (new patients/patient in medical home=DY2 225/180, DY3-259/228, DY4—298/274, DY5-342/329 for a total new patients of 1,124 and 1,010 assigned to medical home). It is also estimated of the 1500 existing patients ,70% will be assigned to medical home and so by DY 5 total medical home patients 80 % of patient served by clinic (2600 total patients, 2080 assigned to medical home).

Category 3 outcomes: IT-11.5 Our goal is to reduce the All-cause Admission Rate for Chronically-ill patients in medical home by 10% in DY4 and 15% by DY5.

Project Description:
Dallas County's public hospital is at, or has exceeded, its currently available primary care capacity. Community hospitals and private physicians are limited in their ability to meet the need, based on current reimbursement/financing mechanisms. This project builds upon existing resources/relationships and focuses on transforming a community/charity clinic to a patient centered medical homes. The PCMH provides a primary care "home" for the patients. Patients are assigned to a "home" with a health care team who provides services based on a patient's unique health needs, effectively coordinates the patient's care across inpatient and outpatient settings and proactively provides preventive, primary, routine and chronic care.

Medical City Dallas has partnered with the Metrocrest Family Medical Clinic, a community clinic in Farmers Branch, Texas to provide a primary care to uninsured patients. Metrocrest Family Medical Clinic will see 4,000 to 5,000 visits in 2012. It has grown steadily in the past 2 years with the addition of a Medical City Internal Medicine physician who is available full time at the clinic. However the clinic has also relied heavily on volunteer staff and providers.

The clinic will seek Patient Centered Medical Home designation with the assistance of Medical City Dallas Hospital.

Clinics and Primary Care Physicians

Clinics and primary care physicians serve as the medical home for patients. The principle role is to provide a single point of accessible, continuous, comprehensive and coordinated medical care which includes specialists, hospital and post-acute care.

Community Care Transitions

Staff performing community care transitions will be supported by a CHW or social worker from Medical City Dallas. Their principle role is to respond to patient referrals to facilitate efficient hospital discharge and post-acute care connection to a primary care clinic or physician.

Community Pharmacy Navigation

Staff performing pharmaceutical navigation are dedicated to facilitating the continuous access to prescribed medications for low-income, uninsured chronically ill patients. The principle role is to assist patients taking chronic disease management medications to access affordable generic and brand named products from pharmaceutical company patient assistance programs.

Community Case Management

Staff performing case management are qualified personnel dedicated to helping the primary care clinic and physician provide chronic disease management to complex patients. It is estimated that 5-10% of the population will require Case Management services. This service enables clinic to accept the sickest, most challenging patients from community.

Goals and Relationship to Regional Goals:

The purpose is to expand and improve a community-based, multi-stakeholder, health care access program increasing the capacity to care for more uninsured Region 9 residents while demonstrating accountability for improved health outcomes.
Key functional elements include:

- Assess current clinic operations and perform gap analysis for achieving certified patient centered medical homes status.
- Implement strategic plan to address gaps and begin pathway to achieving certified medical home status
- Partnering with community hospital committed to efficient post-acute care transitions.

- Community Care Transitions staff facilitating effective and efficient post-acute care
- Case Management staff facilitating chronic disease care plans
- A Quality Improvement Plan to help achieve improved outcomes.

How this project addresses regional goals

A major goal of the region is to provide improved access to coordinated primary care. This project would contribute to achieving that goal by implementing a collaborative across multiple providers at clinic and hospital committed to identifying eligible uninsured residents access to a patient centered medical home. The project is supportive of improving regional access to care for eligible low income Region 9 residents and improving health outcomes.

Challenges

Community hospitals and private physicians are limited in their ability to meet the needs of the growing number of the uninsured population. This project aims to expand access to this population by creating a patient centered medical home which will increase efficiency and reduce the cost of providing care to this population. Options for the uninsured to access coordinated and comprehensive health care are limited. This project was specifically selected because the Medical City Dallas has a history of working together with Metrocrest Clinic to address these needs of eligible uninsured residents in Region 9. The project aims to provide patients with additional high quality services that are accountable and measurable and improve their care and health care experience.

5 Year Expected Outcomes

The expected outcomes for Metrocrest Family Medical Clinic are to provide the following for a "cohort" of uninsured/underinsured Region 9 residents:

Core Outcomes

- Establish medical home assignment criteria
- Identify evidence based training materials for medical homes based on model change concepts
- Identify and increase in the number of patients obtaining primary care medical home
- Identify and improve the number/percent of new patients that receive their first appointment in a timely manner

Starting Baseline:

The clinic had approximately 1500 unduplicated patients at the clinic in 2011. It is estimated that a significant percentage of these patients will qualify for medical home assignment. However the criteria will need to be developed and a baseline established in DY 2. Based on

that experience, we plan to increase the number of eligible patients assigned to a medical home to 80% of eligible patients at the clinic. Medical City Dallas has partnered with the Metrocrest Family Medical Clinic since 2010 to provide a primary care to patients. In 2012, Metrocrest will see 4,000 medical visits.

Rationale:

As indicated in the Dallas Fort Worth Hospital Council's RHP 9 Community Needs Assessment, there is a strong demand for primary care services. The demand for hospital, primary care and specialty care services exceeds the supply of available medical physicians in the hospital's service area, thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Many primary care physicians accept a limited number of the Medicaid/Uninsured population due to the lack of coordination of care and access to appropriate ancillary services. Consequently, many residents seek primary care treatment in emergency care settings resulting in increased healthcare costs and higher volumes of preventable and avoidable cases populating emergency department waiting rooms. Thus, improved/continued support to physicians, community/charity clinics and hospitals the implementation of innovative approaches can have a significant impact on the uninsured ability to access care and improve outcomes. We have selected this project to enhance the role of the of community/charity clinics by creating more patient centered medical care home options in the region. The key project components will be addressed

Project Components

Our project includes the following components to develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards. Required core project components of option 2.1.1:

- Utilize a gap analysis to assess community/charity clinics' NCQA PCMH readiness.
- Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status
- Conduct educational sessions for community/charity clinic's boards of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision.
- Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population.

Our milestones measure an increased population receiving care through a PCMH model of care: (1) we are establishing and implementing medical home assignment criteria, (2) we are utilizing evidence based training materials for medical homes based upon model change concepts, (3) we are increasing the number of eligible patients assigned to a medical home, (4) we are increasing the number of new patients assigned to medical homes that are contacted for medical visit within 60 – 120 days and (5) we are documenting medical home recognition/accreditation of community/charity clinic by a nationally recognized agency

Unique Community Need Identification Numbers the Project Addresses:

CN.3 Healthcare Capacity
CN.8 Chronic Disease

How the project significantly enhances an existing delivery system reform initiative

This project enhances an existing partnership of Medical City Dallas Hospital and Metrocrest Family Clinic. This project expands/increases the number of patients accessing care at a medical home and establishes a quality improvement committee to look at clinical outcomes.

Related Category 3 Outcome Measures:
Outcome measure and Reason/rationale for selecting the outcome measures:
The impact can be measured by one standalone Category 3 Outcome Measure IT-11-5 All-Cause Admission Rate for Chronically-Ill patients. This measure is will demonstrate the importance of assigning low income uninsured residents to a medical home. As indicated in the Dallas Fort Worth Hospital Council's RHP 9 Community Needs Assessment, an analysis of the emergency department encounters demonstrates that many in the population are accessing emergency departments for both urgent and non-urgent conditions. Emergency room encounters that result in an in-patient admission tend to be more complex in nature and based on the data, the most frequent conditions that lead to admissions were: stroke, congestive heart failure, weak/failing kidneys, heart attack, and chronic bronchitis. There is a correlation between hospitalization for chronically-ill patients and access to primary care. Timely and effective primary care could reduce the risk of hospitalizations due to ambulatory care sensitive conditions.

Relationship to other Projects:
This project is related to 020943901.4.2, 209439013.4.5 and 20943901.4.6. The program will work with patients to find available primary care/ medical home and other health care services in the community rather than utilize emergency department costly care.

Relationship to other Performing Providers in the RHP and Plan for Learning Collaboratives:
The following providers are also proposing projects to address expanding medical homes:

- Baylor University Medical Center
- Baylor Garland
- Baylor Irving
- Methodist Dallas Medical Center
- Texas Health Presbyterian Health Dallas

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that

is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation:

Approach/Methodology: Medical City Dallas defined the population that will be directly impacted by the project as patients assigned a medical home at the Metrocrest clinic. There were 2 measures used for this project valuation, patient provided a medical home and reduced admissions. The population expected to be positively impacted by the project for primary care and medical home is 2080 patients by DY 5. Full value was given to new patients estimated assigned to medical home (DY2-180, DY3-228, DY4-274, DY5-329) but only 70% of value was given to patients already clients of clinic (1050). The estimated pricing for medical home was $650 per year per patient. This value was obtained from averages of various PCMH studies (Intermountain Healthcare, Blue Cross Blue Shield, etc.) The value is based on investing in primary care patient centered medical homes resulting in improved quality of care and patient experiences and costs compared to non-PCMH patients and reductions in expensive hospital and emergency department utilization. This totaled approximately $ 3,392,430 for 4 years.

The population expected to be positively impacted by the project for reduction in All –cause admissions 70 admissions by DY 5. The estimated cost for admissions from internal data is $7,100. This totaled approximately $497,000.

The remainder of $66,847 for total value was reduced to balance total funding.

The total value of the project then was estimated at $3,822,583. Approximately 78.68% of the total value was assigned to Category 2 project ($3,007,899)and the remaining 21.31%% of value assigned to Category 3 outcome for All Cause Admission ($814,684).

- **Rationale/Justification:** The outcome improvement targets are dependent on the target population served (chronic illness patient tions will have increased admissions due to higher incidence rates), size and also current processes in place that already prevent avoidable hospitalizations.

Project Option 2.2.2 - Expand Chronic Care Management Models

Unique Project ID: 126679303.2.1
Performing Provider Name/TPI: Methodist Charlton Medical Center/126679303

Provider: Methodist Charlton Medical Center is a 269-bed facility in southern Dallas County serving a 357 square mile area and a population of approximately 393,000.
Methodist Charlton Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, thirty-nine percent of Methodist Charlton's patients were Medicaid eligible or uninsured representing $197 million in charges for those services.

Intervention: The primary purpose of this project is to develop and implement a chronic disease management intervention geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization.

This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Need for Project: Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing.

More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Target Population: The target population is our ED patients that have either a principal or secondary diagnosis ofdiabetes and need education on managing diabetes and have high risk needs associated with diabetes based on clinical protocols of HbA1c >9.0%, at least one ED visit in the past 12 months and/or have not received diabetes education within the past five years. Our annual ED visits are approximately 72,000. Those diagnosed with diabetes as the primary or secondary diagnosis is 4,796.
Approximately 39% of our patients are either Medicaid eligible or indigent so we expect about 39% of the patients enrolled in the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-17 Apply the chronic care model to targeted chronic diseases which are prevalent locally such as Diabetes. Of our target population, we expect 30%

to be eligible or in need of diabetes care model. Our baseline is zero as this a new program at the hospital. In DY3 the goal is to begin providing care through the new program with 10 new patients receiving care under the chronic care management program by 9/30/14, increasing that number to 1,439 in DY4 with an additional improvementof 5% over DY4 in DY5.

I-18 Improve the percentage of diabetic inpatients with self-management goals. The baseline is zero as this is a new program at the hospital. The project seeks to improve number of diabetic ED patients with self-management goals from 0 to 5% of the target population (those identified above as eligible for the chronic care managmenet program) or 72 patients in DY4 and an additional 5% to 144 patients in DY5.

Category 3 Outcome: IT-1.11 Diabetes care: Blood pressure control (<140/80mm Hg). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 25% of the 1,439 eligible expected to be in the program of 360 patients will have controlled blood pressure. Therefore, in DY4, the goal is to increase the number of target patients in the program with controlled blood pressure by 1.5% and an additional improvement in DY5 of 1.5% over DY4.

- IT-1.10 Diabetes care: HbA1c poor control (>9.0%). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 65% of the target population or 935 patients will have uncontrolled A1c levels. Therefore, in DY4, the goal is to decrease the number of target patients in the program with uncontrolled A1c levels by 1.5% with an additional decrease of 1.5% over DY4 in DY5.

- IT-3.3 Diabetes 30 day readmission rate. Improvement Target: The target population in DY4 for this program is expected to be 1,439 patients. Historically the diabetes readmission rate is 5.21%. Therefore, we expect the diabetes 30-day readmission rate among this target population to be 5.21% or 75 patients. Therefore, in DY4, the goal is to decrease diabetes 30-day readmissions to the hospital from this target population by 10% with an additional 10% reduction over DY4 in DY5.

These outcomes support the project's purpose because if we do a better job of keeping people's blood pressure and HbA1C levels within appropriate limits, it will lower readmissions and the cost associated with managing chronic conditions of our patients.

Project Description

This project will apply evidence-based care management models for ED patients identified as having high-risk health care needs associated with diabetes. The project will develop chronic disease management education, protocols and self-management criteria for patients through a multi-disciplinary process. These protocols, once developed will be implemented in the hospital

through new outpatient and inpatient education services, through the network of primary care physicians and made available to community clinics supporting diabetic patients. Historically, patients that do not effectively manage their diabetes tend to develop chronic diabetes complications, co-morbidities and lead to higher utilization and costs related to health care services. This program will be implemented to help those who need education on managing diabetes and providing monitoring services where they are being treated. Patients will be identified by partnering with primary care physicians, community clinics and inpatient nurse/care managers. Patients identified as having high risk needs associated with diabetes will be based on clinical protocols of A1C>9, at least on ED visit in the past 12 months and/or have not received diabetes education within the past five years.

Goals and Relationship to Regional Goals

The goal of this project is to develop and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. The purpose for implementing a chronic disease management program for diabetes is based on hospital and community data. Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Dallas county population having been diagnosed with diabetes. The development and implementation of chronic disease management interventions for diabetes will lower costs and improve outcomes for the diabetic patients and community health status.
A major goal of the region is to improve the rate of chronic disease self-management and education. This project will contribute to that goal by providing patient education resources based on clinical management protocols.

Challenges

Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment. Hispanics are 1.5 times as likely to develop diabetes as non-Hispanic populations according to the CDC. Effective communication and creativity in reaching this community demographic has been identified as a challenge for this project.

5-Year Expected Outcome for Provider and Patients

- Formed multi-disciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
- Developed a comprehensive diabetes care management program

- Developed and implemented plan for standing orders for diabetes patients
- Trained staff in the Chronic Care Model, including essential components of a delivery system that supports high-quality clinical and chronic diabetes management, and on the standing orders for diabetes patients
- Developed and implemented OP Diabetes Education Clinic and IP Educator program to assist patients to better self-manage their chronic diabetes
- Improved number of patients with self-management goals
- Improved number of patients being treated under the Chronic Care Model and/or Standing Orders for Diabetes

Starting Point/Baseline

Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Tarrant county population having been diagnosed with diabetes. The hospital currently does not offer outpatient diabetes education clinic services or inpatient diabetes education. During DY2 and DY3 as the chronic health management program and clinical protocols for standing orders are developed, the target populations will begin to be identified. Historically, the ED has seen approximately 4,796 patients that also have a principal or secondary diagnosis of diabetes. We expect to target 30% of those with the program; 25% (or 360) are expected to have controlled blood pressure and 65% (or 935) uncontrolled A1c level >9.0%.

Rationale

Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing. More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Project Components

The following core project components were selected because they are sequential steps necessary to implement the project and each is designed to apply evidence-based care management model to patients identified as having high-risk health care needs related to diabetes.

a. We will design and implement multi-disciplinary teams that are tailored to the patient's health care needs to include clinical nursing, physician representation as well as members from finance, patient education and existing employee medical home leadership.

b. Patients enrolled into the program will receive contact information from patient navigators to ensure that patients can access their care teams in person, phone or email

c. An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital's current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

d. Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions.

e. We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital's current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Unique Community Need Identification Numbers the Project Addresses

- CN.9: Chronic Care
- CN.12: ED Utilization and Readmissions

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

- IT-1.10: Diabetes Care: HbA1c poor control (>9.0%)
- IT-1.11: Diabetes Control: Blood pressure control (<140/80mm Hg
- IT-3.3: Diabetes 30-Day Readmission Rate

There are three Related Category 3 Outcome Measures for this project. The first two fall within Outcome Measure "Primary Care and Chronic Disease Management" (OD-1). Specifically the two Improvement Targets are IT-1.10 (Diabetes Care: HbA1c poor control (>9.0%)) and IT-1.11 (Diabetes Control: Blood pressure control (<140/80mm Hg)). This project will identify patients in the ED who that are identified as having poor diabetes control. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market ultimately leading to better diabetes control outcomes.

The third Related Category 3 Outcome Measure falls within the Outcome Measure "Potentially Preventable Re-Admissions – 30-Day Readmission Rates" and IT-3.3 Diabetes 30 day readmission rate. This project will identify ED patients who have poor diabetes control and ultimately at high risk for readmission to the hospital. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market. Better preparing patients for self-management, education and ongoing support for diabetes care will ultimately lead to reduced diabetic re-admissions from this target population.

Reasons/Rationale for selecting outcome measures

Our process milestones measure the development of chronic care management program for diabetes, training and education of care givers in multiple care sites, development of standing orders for diabetic patients and the development of a new Outpatient Diabetes Education service and new Inpatient Educator program. The Improvement milestones measure the number of individuals that will targeted for the education and self-management protocols, as well as the increased number of patients with self-management goals. The specific improvement targets for the number of patients provided services for education and the number of patients with self-management goals will be determined during DY2.

Relationship to Other Projects

Related projects regarding chronic care management include:

209345201.2.1 Methodist Richardson Medical Center
135032405.2.2 Methodist Dallas Medical Center

This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1. 2 (Preventable Admissions)-Diabetes Admission Rate
- RD-2.2 (Preventable 30 Day Re-Admissions)-Diabetes Re-Admission Rate
- RD-4.2 (Patient Centered Healthcare)-Medication Management

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

The RHP 9 projects regarding chronic care management are as follows:

Performing Provider	Unique Project	Project Option

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Project Option 2.9.1 - Establish/Expand a Patient Care Navigation Program

Unique Project ID: 126679303.2.2
Performing Provider Name/TPI: Methodist Charlton Medical Center/126679303

Provider: Methodist Charlton Medical Center is a 269-bed facility in southern Dallas County serving a 357 square mile area and a population of approximately 393,000.
Methodist Charlton Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, thirty-nine percent of Methodist Charlton's patients were Medicaid eligible or uninsured representing $197 million in charges for those services.

Intervention: To provide patient navigation services in the Emergency Room to patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management which should improve unnecessary ED utilization as well as the health condition of those most at risk for costly chronic conditions.

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Need for Project: A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Target Population: The target population is frequent users of the emergency department, defined as six or more visits per year, estimated to be 8.6% of total ED visits, or 6,210 patients per year. Approximately 49% of our ED patients are either Medicaid eligible or indigent so we expect nearly half of the patients helped by the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-6 Increase number of PCP referrals for patients without a medical home who use the ED, urgent care and/or hospital services. Improvement Target: Baseline will be established in DY3, which is expected to be 6,210 targeted patients identified as frequent users of ED services. The project seeks to refer at least 50% of this target population or 3,105 to a more appropriate primary care setting for follow up care in DY4 and 70% of the original baseline referred to primary care in DY5. I-8 Reduction in ED use by identified ED frequent users receiving navigation. Improvement Target: Baseline will be

established in DY3 which is expected to be 3,105. The project seeks to realize a 2.5% reduction over baseline expected in DY4 and an additional improvement of 2.5% of the prior year in DY5.

Category 3 Outcome: IT-9.2 Appropriate ED Utilization. Improvement Target: Baseline will be established in DY3 which is expected to be 3,105. Decrease utilization of ED patients from baseline by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5.

IT-3.1 All cause 30 day readmission rate. Improvement Target: Baseline will be established in DY3 which is expected to be 554. Decrease readmissions to the hospital from targeted baseline population by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5.

These improvement milestones and outcomes support the project's objective to reduce utilization of high cost ED settings by placing frequent users of the emergency department into a more appropriate care setting.

Project Description

This project will provide patient navigation services in the Emergency Room to targeted patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will increase the number of people trained and deployed for innovative health services such as social workers. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management. This project should improve the utilization of unnecessary ED utilization as well as improve the health condition of those most at risk for costly chronic conditions.

Goals and Relationship to Regional Goals

The goal of this project is to utilize community health workers, case managers or other types of healthcare professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of care services. Patient Navigators will ensure that patients receive timely, coordinated and site appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the ED to site-appropriate locations. Implementing this project will identify health care workers, case managers or other types of health professionals needed to engage with patients in a culturally and linguistically appropriate manner that will be essential to guiding the patients through the integrated health care delivery systems.

A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more

appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Challenges

Emergency Departments have become a vital source of care for those without insurance who generally lack a source of primary care, since they are required to evaluate and treat patients regardless of the ability to provide payment. Consequently, although care delivered through the ED is frequently for non-urgent problems, it is substantially more costly than care delivered in a more appropriate setting. DFW and National data indicate that the 26% of non-elderly individuals that are without health insurance exceeds the nearly 19% nationally of non-elderly individuals are without health insurance. These rates increase for individuals with lower incomes. Minority and low-income individuals without insurance generally lack a regular source of medical care, and suffer from medical conditions that are either preventable or easily treated in the outpatient setting. Consequently, the uninsured are four times more likely than the insured to forgo or postpone needed preventative care. The ED has become a societal solution for those with chronic conditions and/or lacking access to primary care. The patient navigation project will be focused on overcoming these societal challenges. Additional challenges will include the acquisition of professional resources that have a background and training to provide social services and navigation care services, as well as overcoming the reliance on personal accountability of the patient to follow up with a provider in a more appropriate care setting.

5-Year Expected Outcome for Provider and Patients

The expected outcomes for the patient navigation project are to:

- Identified frequent ED users and use of navigators as part of preventable ED reduction program.
- Trained health care navigators in cultural competency.
- Deployed innovative health care personnel such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connected patients to primary and preventative care.
- Increased access to care management and/or chronic care management, including education in chronic disease self-management.
- Decreased of inappropriate ED utilizations.

<u>Starting Point/Baseline</u>

Currently the baseline is zero. During DY2 frequent ED users will be identified based on a needs assessment to identify the patient population for which the program will be targeted. Patient navigation and care management will be provided to these patients. DY3 will serve as the baseline period for the project. Based on the number of patients served by the project, the number of providers trained to support the program will be identified and implemented

Rationale

Emergency Department utilization in North Texas exceeds national utilization rates resulting in higher costs for providing care to the region. The Community Health Needs Assessment points to a lack of accessing primary care sites and the inability to redirect patients to a more appropriate care setting. The patient navigator project will provide resources to help patients and their families better locate and navigate appropriate care locations.

Project Components

The following core project components were selected because each component is designed to provide and improve navigation services to targeted patients who are at high risk of disconnect from institutionalized health care:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators

c) Connect patients to primary and preventative care

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management

e) We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Unique Community Need Identification Numbers the Project Addresses

- CN.1: Demographics

- CN.2: Healthcare Infrastructure
- CN.8: Specialty Care
- CN.10: Oral Health
- CN.11: Patient Safety and Quality
- CN.13: Palliative Care

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

There are two Related Category 3 Outcome Measures for this project. The first is Outcome Measure "Right Care, Right Setting" (OD-9) and IT-9.2 ED Utilization. Specifically there will be a reduction in all ED visits if the patient navigation program is effective. By identifying frequent users of the ED and providing navigation services, these patients will be exposed to alternative care locations that would be more effective for managing their non-urgent health conditions and health need. The IT-9.2 measures is the most appropriate indicator to assess the results of care experienced by patients, including patients' clinical events, patients' recovery and health status, patients' experiences in the health system, and efficiency/cost.
The second is Outcome Measure "Potentially Preventable Re-Admissions – 30 Day Readmission Rates" and IT-3.1 All cause 30 day readmission rate. The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the lack of chronic disease management and lack of access to appropriate sites of care. The patient navigator program will re-direct patients from the ED to a more appropriate care setting, where management of chronic conditions will be better suited. A reduction in frequent ED users and access to better care site for chronic conditions will lead to a reduction in readmission rates for those enrolled in the program.

Reasons/Rationale for selecting outcome measures

Our milestones measure the reduction in the number of patients that frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED, 2) increasing the number of patient navigators available to provide services to those patients, and 3) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of ED visits by those enrolled in the program 5% by DY5. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

Relationship to Other Projects

135032405.2.3 Methodist Dallas Medical Center
209345201.2.2 Methodist Richardson Medical Center

This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1.1 (Preventable Admissions)-CHF Admission Rate
- RD-1.2 (Preventable Admissions)-Diabetes Admission Rate
- RD-1.4 (Preventable Admissions)-COPD/Asthma Admission Rate
- RD-1.5 (Preventable Admissions)-Hypertension Admission Rate
- RD-2.1 (Preventable 30 Day Re-Admissions)-CHF Re-Admission Rate
- RD-2.2 (Preventable 30 Day Re-Admissions)-Diabetes Re-Admission Rate
- RD-2.4 (Preventable 30 Day Re-Admissions)-COPD/Asthma Re-Admission Rate
- RD-2.5 (Preventable 30 Day Re-Admissions)-Hypertentsion Re-Admission Rate

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives
The RHP 9 projects related to patient navigation are as follows:

Performing Provider	Unique Project
Baylor Medical Center at Garland	121790303.2.4
Baylor Medical Center at Irving	121776204.2.4
Baylor University Medical Center	139485012.2.3
Children's Medical Center	138910807.2.3
Medical Center of Lewisville (HCA)	094192402.2.3
Methodist Charlton Medical Center	126679303.2.2
Methodist Dallas Medical Center	135032405.2.3
Methodist Richardson Medical Center	209345201.2.2

Texas Health Presbyterian – Denton	020967801.2.1
Texas Health Presbyterian – Kaufman	094140302.2.1
University of Texas Southwestern	126686802.2.4

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

2.9.1 Establish/Expand a Patient Care Navigation Program

Unique Project ID: 135032405.2.1
Performing Provider Name/TPI: Methodist Dallas Medical Center/ 135032405

Provider: Methodist Dallas Medical Center is a 515-bed facility in southern Dallas County serving a 537 square mile area and a population of approximately 1,019,000.
Methodist Dallas Medical Center is a designated safety net hospital and the only Level 2 trauma center located in its service area, providing a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. In the last year, forty-five percent of Methodist Dallas' patients were Medicaid eligible or uninsured representing $327 million in charges for those services.

Intervention: To provide patient navigation services in the Emergency Room to patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management which should improve unnecessary ED utilization as well as the health condition of those most at risk for costly chronic conditions.

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Need for the Project: A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Target Population: The target population is frequent users of the emergency department, defined as six or more visits per year, estimated to be 8.5%-9% of total ED visits, or 5,200 patients per year.

Approximately 56% of our ED patients are either Medicaid eligible or indigent so we expect about 56% of the patients helped by the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-6 Increase number of PCP referrals for patients without a medical home who use the ED, urgent care and/or hospital services. Improvement Target: Baseline will be established in DY3, which is expected to be 5,200 targeted patients identified as frequent users of ED services. The project seeks to refer at least 50% of this target

population or 2,600 to a more appropriate primary care setting for follow up care in DY 4 and 70% of the original baseline referred to primary care in DY5.
I-8 Reduction in ED use by identified ED frequent users receiving navigation. Improvement Target: Baseline will be established in DY3 which is expected to be 2,600. The project seeks to realize a 2.5%reduction over baseline expected in DY4 and an additional improvement of 2.5% over the prior year in DY5.

Category 3 Outcome:

IT-9.2 Appropriate ED Utilization. Improvement Target: Baseline will be established in DY3 which is expected to be 2,600. Decrease utilization of ED patients from baseline by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5.

IT-3.1 All cause 30 day readmission rate. Improvement Target: Baseline will be established in DY3 which is expected to be 465. Decrease readmissions to the hospital from targeted baseline population by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5.

These improvement milestones and outcomes support the project's objective to reduce utilization of high cost ED settings by placing frequent users of the emergency department into a more appropriate care setting.

Project Description

This project will provide patient navigation services in the Emergency Room to targeted patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will increase the number of people trained and deployed for innovative health services such as social workers. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management. This project should improve the utilization of unnecessary ED utilization as well as improve the health condition of those most at risk for costly chronic conditions.

Goals and Relationship to Regional Goals

The goal of this project is to utilize community health workers, case managers or other types of healthcare professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of care services. Patient Navigators will ensure that patients receive timely, coordinated and site appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the ED to site-appropriate locations. Implementing this project will identify health care workers, case managers or other types of

health professionals needed to engage with patients in a culturally and linguistically appropriate manner that will be essential to guiding the patients through the integrated health care delivery systems.

A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Challenges

Emergency Departments have become a vital source of care for those without insurance who generally lack a source of primary care, since they are required to evaluate and treat patients regardless of the ability to provide payment. Consequently, although care delivered through the ED is frequently for non-urgent problems, it is substantially more costly than care delivered in a more appropriate setting. DFW and National data indicate that the 26% of non-elderly individuals that are without health insurance exceeds the nearly 19% nationally of non-elderly individuals are without health insurance. These rates increase for individuals with lower incomes. Minority and low-income individuals without insurance generally lack a regular source of medical care, and suffer from medical conditions that are either preventable or easily treated in the outpatient setting. Consequently, the uninsured are four times more likely than the insured to forgo or postpone needed preventative care. The ED has become a societal solution for those with chronic conditions and/or lacking access to primary care. The patient navigation project will be focused on overcoming these societal challenges. Additional challenges will include the acquisition of professional resources that have a background and training to provide social services and navigation care services, as well as overcoming the reliance on personal accountability of the patient to follow up with a provider in a more appropriate care setting.

5-Year Expected Outcome for Provider and Patients

The expected outcomes for the patient navigation project are to:

- Identified frequent ED users and use of navigators as part of preventable ED reduction
- Trained health care navigators in cultural competency.
- Deployed innovative health care personnel such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connected patients to primary and preventative care.
- Increased access to care management and/or chronic care management, including education in chronic disease self-management.
- Decreased of inappropriate ED utilizations.

Starting Point/Baseline

Currently the baseline is zero. During DY2 frequent ED users will be identified based on a needs assessment to identify the patient population for which the program will be targeted. Patient navigation and care management will be provided to these patients. DY3 will serve as the baseline period for the project. Based on the number of patients served by the project, the number of providers trained to support the program will be identified and implemented.

Rationale

Emergency Department utilization in North Texas exceeds national utilization rates resulting in higher costs for providing care to the region. The Community Health Needs Assessment points to a lack of accessing primary care sites and the inability to redirect patients to a more appropriate care setting. The patient navigator project will provide resources to help patients and their families better locate and navigate appropriate care locations.

Project Components

The following core project components were selected because each component is designed to provide and improve navigation services to targeted patients who are at high risk of disconnect from institutionalized health care:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators

c) Connect patients to primary and preventative care

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management

e) We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Reasons/Rationale for selecting outcome measures

Our milestones measure the reduction in the number of patients that frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED, 2) increasing the number of patient navigators available to provide services to those patients, and 3) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of ED visits by those enrolled in the program by 5% by DY5. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

Unique Community Need Identification Numbers the Project Addresses

- CN1 Demographics
- CN2 Health care infrastructure
- CN8 Specialty Care
- CN9 Chronic Disease
- CN11 Patient Safety & Quality
- CN13 Palliative Care

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

There are two Related Category 3 Outcome Measures for this project. The first is Outcome Measure "Right Care, Right Setting" (OD-9) and IT-9.2 ED Utilization. Specifically there will be a reduction in all ED visits if the patient navigation program is effective. By identifying frequent users of the ED and providing navigation services, these patients will be exposed to alternative care locations that would be more effective for managing their non-urgent health conditions and health need. The IT-9.2 measures is the most appropriate indicator to assess the results of care experienced by patients, including patients' clinical events, patients' recovery and health status, patients' experiences in the health system, and efficiency/cost.

The second is Outcome Measure "Potentially Preventable Re-Admissions – 30 Day Readmission Rates" and IT-3.1 All cause 30 day readmission rate. The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the lack of chronic disease management and lack of access to appropriate sites of care. The patient navigator program will

re-direct patients from the ED to a more appropriate care setting, where management of chronic conditions will be better suited. A reduction frequent ED users and access to better care site for chronic conditions will lead to a reduction in readmission rates for those enrolled in the program.

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Project Option 2.2.2 – Expand Chronic Care Management Models

Unique Project ID: 135032405.2.2
Performing Provider Name/TPI: Methodist Dallas Medical Center/135032405

Provider: Methodist Dallas Medical Center is a 515-bed facility in southern Dallas County serving a 537 square mile area and a population of approximately 1,019,000.
Methodist Dallas Medical Center is a designated safety net hospital and the only Level 2 trauma center located in its service area, providing a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. In the last year, forty-five percent of Methodist Dallas' patients were Medicaid eligible or uninsured representing $327 million in charges for those services.

Intervention: The primary purpose of this project is to develop and implement a chronic disease management intervention geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization.
This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Need for the Project: Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing.
More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Target Population: The target population is our ED patients that have either a principal or secondary diagnosis of diabetes and need education on managing diabetes and have high risk needs associated with diabetes based on clinical protocols of HbA1c >9.0%, at least on ED visit in the past 12 months and/or have not received diabetes education within the past five years. Our annual ED visits are approximately 62,000. Those diagnosed with diabetes as the primary or secondary diagnosis is 5,360.

Approximately 45% of our patients are either Medicaid eligible or indigent so we expect about 45% of the patients enrolled in the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-17 Apply the chronic care model to targeted chronic diseases which are prevalent locally such as Diabetes. Of our target population, we expect 30% to be eligible or in need of a diabetes care model. Our baseline is zero as this is a new program

at the hospital. In DY3 the goal is to begin providing care through the new program with 10 new patients receiving care under the chronic care management program by 9/30/14, increasing that number to 1,608 in DY4 with an additional improvement of 5% over DY4 in DY5.

I-18 Improve the percentage of diabetic inpatients with self-management goals. The baseline is zero as this is a new program at the hospital. The project seeks to improve number of diabetic ED patients with self-management goals from 0 to 5% of the target population (those identified above as eligible for the chronic care management program), or 80 patients in DY4 and an additional 5% or 160 patients by DY5.

Category 3 Outcome: IT-1.11 Diabetes care: Blood pressure control (<140/80mm Hg). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 25% of the 1,608 eligible expected to be in the program or 402 patients will have controlled blood pressure. Therefore, in DY4, the goal is to increase the number of target patients in the program with controlled blood pressure by 1.5% and an additional improvement in DY5 of 1.5% over DY4.

IT-1.10 Diabetes care: HbA1c poor control (>9.0%). Improvement Target: While the baseline is zero as this is a new program at the hospital, it expected that 65% of the target population or 1,045 patients will have uncontrolled A1c level. Therefore, in DY4, the goal is to decrease the number of target patients in the program with uncontrolled A1c levelsby 1.5% with an additional decrease of 1.5% over DY4 in DY5.

IT-3.3 Diabetes 30 day readmission rate. Improvement Target: The target population in DY4 for this program is expected to be 1,608 patients. Historically, the diabetes readmission rate is 8.95%. Therefore, we expect the diabetes 30-day readmission rate among this target population to be 3.01% or 48 patients. In DY4, the goal is to decrease diabetes 30-day readmissions to the hospital from this target population by 10% with an additional 10% reduction over DY4 in DY5.

These outcomes support the project's purpose because if we do a better job of keeping people's blood pressure and HbA1C levels within appropriate limits, it will lower readmissions and the cost associated with managing chronic conditions of our patients.

Project Description

This project will apply evidence-based care management models for ED patients identified as having high-risk health care needs associated with diabetes. The project will develop chronic disease management education, protocols and self-management criteria for patients through a multi-disciplinary process. These protocols, once developed will be implemented in the hospital through new outpatient and inpatient education services, through the network of primary care physicians and made available to community clinics supporting diabetic patients. Historically, patients that do not effectively manage their diabetes tend to develop chronic diabetes complications, co-morbidities and lead to higher utilization and costs related to health care

services. This program will be implemented to help those who need education on managing diabetes and providing monitoring services where they are being treated. Patients will be identified by partnering with primary care physicians, community clinics and inpatient nurse/care managers. Patients identified as having high risk needs associated with diabetes will be based on clinical protocols of A1C>9, at least one ED visit in the past 12 months and/or have not received diabetes education within the past five years.

Goals and Relationship to Regional Goals

The goal of this project is to develop and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. The purpose for implementing a chronic disease management program for diabetes is based on hospital and community data. Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Dallas county population having been diagnosed with diabetes. The development and implementation of chronic disease management interventions for diabetes will lower costs and improve outcomes for the diabetic patients and community health status.

A major goal of the region is to improve the rate of chronic disease self-management and education. This project will contribute to that goal by providing patient education resources based on clinical management protocols.

Challenges

Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment. Hispanics are 1.5 times as likely to develop diabetes as non-Hispanic populations according to the CDC. Effective communication and creativity in reaching this community demographic has been identified as a challenge for this project.

5-Year Expected Outcome for Provider and Patients

- Formed multi-disciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
- Developed a comprehensive diabetes care management program
- Developed and implemented plan for standing orders for diabetes patients
- Trained staff in the Chronic Care Model, including essential components of a delivery system that supports high-quality clinical and chronic diabetes management, and on the standing orders for diabetes patients

- Developed and implemented OP Diabetes Education Clinic and IP Educator program to assist patients to better self-manage their chronic diabetes
- Improved number of patients with self-management goals
- Improved number of patients being treated under the Chronic Care Model and/or Standing Orders for Diabetes

Starting Point/Baseline

Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Tarrant county population having been diagnosed with diabetes. The hospital currently does not offer outpatient diabetes education clinic services nor inpatient diabetes education. During DY2 and DY3 as the chronic health management program and clinical protocols for standing orders are developed, target populations will begin to be identifified. Historically, the ED has seen approximately 5,360 patients that also have a principal or secondary diagnosis of diabetes. We expect to target 30% of those with the program; 25% (or 402) are expected to have controlled blood pressure and 65% (or 1,045) uncontrolled A1c levels >9.0%.

Rationale

Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing. More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Project Components

The following core project components were selected because they are sequential steps necessary to implement the project and each is designed to apply evidence-based care management model to patients identified as having high-risk health care needs related to diabetes.

a. We will design and implement multi-disciplinary teams that are tailored to the patient's health care needs to include clinical nursing, physician representation as well as members from finance, patient education and existing employee medical home leadership.

b. Patients enrolled into the program will receive contact information from patient navigators to ensure that patients can access their care teams in person, phone or email

c. An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital's current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

d. Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions.

e. We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital's current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Unique Community Need Identification Numbers the Project Addresses

- CN.13 Necessity of patient education programs
- CN.15 Need for more information to promote healthy lifestyles
- CN.11 Need for more care coordination

How the Project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

OD: Primary Care and Chronic Disease Management

- IT-1.10: Diabetes Care: HbA1c poor control (>9.0%)
- IT-1.11: Diabetes Control: Blood pressure control (<140/80mm Hg)

OD-3: Potentially Preventable Readmissions

- IT-3.3: Diabetes 30-day Readmissions rate

There are three Related Category 3 Outcome Measures for this project. The first two fall within Outcome Measure "Primary Care and Chronic Disease Management" (OD-1). Specifically the two Improvement Targets are IT-1.10 (Diabetes Care: HbA1c poor control (>9.0%)) and IT-1.11 (Diabetes Control: Blood pressure control (<140/80mm Hg)). This project will identify patients in the ED who are identified as having poor diabetes control. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market ultimately leading to better diabetes control outcomes.

The third Related Category 3 Outcome Measure falls within the Outcome Measure "Potentially Preventable Re-Admissions – 30-Day Readmission Rates" and is IT-3.3 Diabetes 30 day readmission rate. This project will identify ED patients who have poor diabetes control and ultimately at high risk for readmission to the hospital. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market. Better preparing patients for self-management, education and ongoing support for diabetes care will ultimately lead to reduced diabetic re-admissions from this target population.

Our process milestones measure the development of chronic care management program for diabetes, training and education of care givers in multiple care sites, development of standing orders for diabetic patients and the development of a new Outpatient Diabetes Education service and new Inpatient Educator program. The Improvement milestones measure the number of individuals that will targeted for the education and self-management protocols, as well as the increased number of patients with self-management goals. The specific improvement targets for the number of patients provided services for education and the number of patients with self-management goals will be determined during DY2.

Relationship to Other Projects

Related projects regarding chronic care management include:

- 126679303.2.1: Methodist Charlton Medical Center
- 135032405.2.2: Methodist Dallas Medical Center

This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1.2 (Preventable Admissions)-Diabetes Admission Rate
- RD-2.2 (Preventable 30 Day Re-Admissions)-Diabetes Re-Admission Rate
- RD-4.2 (Patient Centered Healthcare)-Medication Management

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the

program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Project Option 2.1.1 – Enhance/Expand Medical Homes

Unique Project ID: 135032405.2.3

Performing Provider Name/TPI: Methodist Dallas Medical Center/135032405

Provider: Methodist Dallas Medical Center is a 515-bed facility in southern Dallas County serving a 537 square mile area and a population of approximately 1,019,000. Methodist Dallas Medical Center is a designated safety net hospital and the only Level 2 trauma center located in its service area, providing a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. In the last year, forty-five percent of Methodist Dallas' patients were Medicaid eligible or uninsured representing $327 million in charges for those services.

Intervention: The purpose of "The Medical Home" project is to expand and improve a community-based, multi-stakeholder, health care access program increasing the capacity to care for more uninsured Dallas County residents while demonstrating accountability for improved health outcomes.

Key functional elements of "The Medical Home" project include:

- A network of certified patient centered medical homes (e.g. NCQA) for primary care access.
- A narrow network of specialty care physicians for efficient specialty care access.
- A network of community hospitals committed to efficient post-acute care transitions.
- Community Care Transitions staff facilitating effective and efficient post-acute care PCMH connections.
- Community Care Nurse Case Management staff facilitating chronic disease care plans and home-based care (where necessary).
- A network of outpatient ancillary radiology, lab and pharmaceutical services.
- A Health IT system facilitating patient enrollment, referrals, transitional care, case management, risk stratification, chronic disease registries, population management and utilization efficiency reporting.
- A Quality Improvement Plan to help achieve improved outcomes.

The Medical Home project (1) expands/increases the number of patients accessing care at a medical home, (2) through the health information exchange, links clinical data sharing between performing providers, physicians and community/charity clinics and (3) establishes a quality improvement committee to look at clinical outcomes.

Need for Project: The regional need is to provide improved access to coordinated primary and specialty care. This project would contribute to achieving that goal by implementing a

collaborative across multiple performing providers committed to identifying eligible uninsured residents access to a patient centered medical home. The project is multi-stakeholder regional approach to address access to care for eligible low income Dallas County residents.

Target Population: The target population is our patients are assigned to a "home" with a health care team who provides services based on a patient's unique health needs, effectively coordinates the patient's care across inpatient and outpatient settings and proactively provides preventive, primary, routine and chronic care.

Approximately 45% of our patients are either Medicaid eligible or indigent so we expect about 45% of the patients enrolled in the program to be Medicaid eligible or indigent.

Category 1 or 2 Expected Patient Benefits:

I-12: Based on criteria, improve the number of eligible patients that are assigned to the medical homes. The project seeks to increase the number of eligible patients assigned to medical home by 10% over baseline in DY4 and additional improvement of 10% over DY4 in DY5.

I-13 New patients assigned to a medical home receive their first appointment in a timely manner. The project will improved the percent of new patients assigned to medical home for their first visit in 60-120 days by 10% over baseline in DY4 and additional improvement of 15% over DY4 in DY5.

Category 3 Outcome selected: IT-11.5 All cause admission rate for Chronically-ill patients as defined by performing provider. In DY4, achieve an admission rate approximately 10% lower than baseline for patients enrolled at least one year in the Medical Home project and 15% lower in DY5.

Project Description

Dallas County's public hospital is at, or has exceeded, its currently available primary and specialty care capacity. Community hospitals and private physicians are limited in their ability to meet the need, based on current reimbursement/financing mechanisms. To address this challenge, Methodist Dallas Medical Center will support two charitable clinics in their efforts to expand or enhance the delivery of care provided through the Patient Centered Medical Home (PCMH) model. This plan builds upon existing resources/relationships and focuses on transforming two (Grand Prairie Wellness Center and Brother Bills Dallas Clinic) community/charity clinics to patient centered medical homes. The PCMH provides a primary care "home" for the patients. Patients are assigned to a "home" with a health care team who provides services based on a patient's unique health needs, effectively coordinates the patient's care across inpatient and outpatient settings and proactively provides preventive, primary, routine and chronic care. Also, the plan creates financial incentives and opportunities for community hospitals, private physicians and community/charity clinics to provide care to a "cohort" of uninsured/underinsured residents in performing provider service area.

Key components of The Medical Home project are:

Clinics and Primary Care Physicians
MEDICAL HOME clinics and primary care physicians serve as the medical home for MEDICAL HOME patients. The principle role is to provide a single point of accessible, continuous, comprehensive and coordinated medical care which includes specialists, hospital and post-acute care.

Specialty Care Physicians
MEDICAL HOME specialty care physicians provide specialty and sub-specialty care for MEDICAL HOME patients. The principle role is to have an identified network to schedule specialty appointments in a timely manner based on patient need.

Community Care Transitions
MEDICAL HOME staff performing community care transitions are community health workers supported by a nurse or social worker manager from a participating community hospital. Their principle role is respond to patient referrals to facilitate efficient hospital discharge and post-acute care connection to a primary care clinic or physician.

Community Health Navigation & Transportation
MEDICAL HOME staff performing health navigation and transportation services are community health workers who respond to requests from primary care clinics and physicians on behalf of high-risk patients. The principle role is to develop care coordination plans with patients and families to reduce medical and social complications leading to adherence and compliance barriers.

Community Pharmacy Navigation
MEDICAL HOME staff performing pharmaceutical navigation are community health workers dedicated to facilitating the continuous access to prescribed medications for low-income, uninsured chronically ill patients. The principle role is to assist MEDICAL HOME patients taking chronic disease management medications access affordable generic and brand named products from pharmaceutical company patient assistance programs. This role compliments the MEDICAL HOME pharmaceutical benefit available through PAD's Pharmaceutical Benefits Manager.

Community Specialty Referral Management
MEDICAL HOME staff performing specialty physician care referral management are dedicated to connecting MEDICAL HOME patients and their health information to MEDICAL HOME's specialty care network, upon referral from a primary care provider. The principle role is to reduce the number of days between the primary care physician's decision for a specialty care consultation and the patient's actual specialty care physician visit.

Community Nurse Case Management & House Calls

MEDICAL HOME staff performing case management and house calls are registered nurses and/or advance practice nurses dedicated to helping primary care clinics and physicians provide chronic disease management to complex MEDICAL HOME patients. It is estimated that 5-10% of the MEDICAL HOME population will require Case Management services (and house call when necessary). This service enables MEDICAL HOME to accept the sickest, most challenging patients from participating hospitals.

Project Goals

The purpose of the "The Medical Home" project is to expand and improve a community-based, multi-stakeholder, health care access program increasing the capacity to care for more uninsured Dallas County residents while demonstrating accountability for improved health outcomes. Key functional elements of MEDICAL HOME include:

- A network of certified patient centered medical homes (e.g. NCQA) for primary care access.
- A narrow network of specialty care physicians for efficient specialty care access.
- A network of community hospitals committed to efficient post-acute care transitions.
- Community Care Transitions staff facilitating effective and efficient post-acute care PCMH connections.
- Community Care Nurse Case Management staff facilitating chronic disease care plans and home-based care (where necessary).
- A network of outpatient ancillary radiology, lab and pharmaceutical services.
- A Health IT system facilitating patient enrollment, referrals, transitional care, case management, risk stratification, chronic disease registries, population management and utilization efficiency reporting.
- A Quality Improvement Plan to help achieve improved outcomes.

The goals of the "The Medical Home" project are:

- Expand or enhance the delivery of care provided through the Patient-Centered Medical Home (PCMH) model.
- Develop incentives focused on quality capable of supporting physicians and clinics for expanding access, beyond their base volunteerism, increasing the number of uninsured working poor with meaningful connections to medical homes, specialty physician care and hospital-based health care services.

- Develop meaningful digital health information collection and exchange between providers of care, to reduce the total medical cost of care while increasing the quality of care for the uninsured working poor.
- Develop actionable health information analytical capability for reporting provider network performance, patient risk stratification and population management, leverage the intellectual property of providers in achieving qualitative and quantitative improvement in care for the uninsured working poor.

Challenges/Issues

Community hospitals and private physicians are limited in their ability to meet the needs of the growing number of the uninsured population. This project aims to expand access to this population by creating more patient centered medical homes which will increase efficiency and reduce the cost of providing care to this population. Options for the uninsured to access coordinated and comprehensive health care are limited. This project was specifically selected because the community has a ten year history of working together to address these needs of eligible uninsured residents in Dallas County. The project aims to provide patients with additional high quality services that are accountable and measurable and improve their care and health care experience.

5 Year Expected Outcomes

The expected outcomes of the "The Medical Home" project are to provide the following for a "cohort" of uninsured/underinsured Dallas County residents:

<u>Core Outcomes</u>

- Establish medical home assignment criteria
- Identify evidence based training materials for medical homes based on model change concepts
- Identify and increase in the number of Dallas residents obtaining primary care medical homes (DYs 2-5 aggregate impact 6600 unduplicated patients)
- Identify and improve the number/percent of new patients that receive their first appointment in a timely manner

<u>Optional Outcome</u>

- Identify and increase in the number of Dallas community clinics achieving patient centered medical home certification from a nationally recognized agency

<u>How is project related to other regional goals</u>

A major goal of the region is to provide improved access to coordinated primary and specialty care. This project would contribute to achieving that goal by implementing a collaborative across multiple performing providers committed to identifying eligible uninsured residents

access to a patient centered medical home. The project is multi-stakeholder regional approach to address access to care for eligible low income Dallas County residents.

Starting Baseline

Community stakeholders including hospitals, physicians and community/charity clinics have worked together for the past decade to identify and provide access to coordinated primary and specialty care for the uninsured. With a baseline of two community/charity clinics, the project has served an aggregate of 410 unduplicated patients of all performing providers between January 1 and September 31, 2012. Based on that experience, we plan to increase the number of eligible patients assigned to a medical home via The Medical Home project by at least 10% annually.

Rationale

As indicated in the Dallas Fort Worth Hospital Council's RHP 9 Community Needs Assessment, there is a strong demand for primary and specialty care services. The demand for hospital, primary care and specialty care services exceeds the supply of available medical physicians in the hospital's service area, thus limiting health care access for many low level management or specialized treatment for prevalent health conditions. Many primary care physicians accept a limited number of the Medicaid/Uninsured population due to the lack of coordination of care and access to appropriate ancillary services. Consequently, many residents seek primary care treatment in emergency care settings resulting in increased healthcare costs and higher volumes of preventable and avoidable cases populating emergency department waiting rooms. Thus, improved/continued support to physicians, community/charity clinics and hospitals through the exchange of information, coordination of services with interconnected health systems, physicians and community/charitable clinics and the implementation of innovative approaches can have a significant impact on the uninsured ability to access care and improve outcomes. We have selected this project to enhance the role of the of community/charity clinics by creating more patient centered medical care home options in the region. The key project components will be addressed

Core Components

Our project includes the following components to develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards.

Required core project components:

- Utilize a gap analysis to assess community/charity clinics' NCQA PCMH readiness.
- Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status
- Conduct educational sessions for community/charity clinic's boards of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision.
- Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts,

identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population.

Reason for selecting milestones/metrics

Our milestones measure an increased population receiving care through a PCMH model of care: (1) we are establishing and implementing medical home assignment criteria, (2) we are utilizing evidence based training materials for medical homes based upon model change concepts, (3) we are increasing the number of eligible patients assigned to a medical home, (4) we are increasing the number of new patients assigned to medical homes that are contacted for medical visit within 60 – 120 days and (5) we are documenting medical home recognition/accreditation of community/charity clinic by a nationally recognized agency (e.g. NCQA).

Community Needs Assessment Identification Number

- CN.3 Healthcare Capacity
- CN.8 Chronic Disease

Describe how the project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project enhances an existing regional program Project Access Dallas. The Medical Home project (1) expands/increases the number of patients accessing care at a medical home, (2) through the health information exchange, links clinical data sharing between performing providers, physicians and community/charity clinics and (3) establishes a quality improvement committee to look at clinical outcomes.

Related Category 3 Outcome Measures

The impact of the proposed The Medical Home project can be measured by one standalone Category 3 Outcome Measure. 1) IT- 11.5 All-Cause Admission Rate for Chronically-Ill patients. This measure is will demonstrate the importance of assigning low income uninsured residents to a medical home. By doing so, this will decrease the admission rate for chronically ill (diagnosis of Diabetes, CHF, Hypertension, COPD, or Asthma) MEDICAL HOME patients post enrollment.

Relationship to other Projects

To be completed by performing provider and/or anchor

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9

and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

2.9.1 Establish/Expand a Patient Care Navigation Program

Unique Project ID: 209345201.2.1
Performing Provider Name/TPI: Methodist Richardson Medical Center/209345201

Summary

Provider: Methodist Richardson Medical Center is a 209-bed facility in northern Dallas County serving a 245 square mile area and a population of approximately 740,000.
Methodist Richardson Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, nearly twenty-six percent of Methodist Richardson's patients were Medicaid eligible or uninsured representing $49 million in charges for those services.

Intervention: To provide patient navigation services in the Emergency Room to patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management which should improve unnecessary ED utilization as well as the health condition of those most at risk for costly chronic conditions.

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Need for the Project: A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Target Population: The target population is frequent users of the emergency department, defined as six or more visits per year, estimated to be 4.3% of total ED visits, or 1,445 patients per year.
Approximately 43% of our ED patients are either Medicaid eligible or indigent so we expect about 43% of the patients helped by the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-6 Increase number of PCP referrals for patients without a medical home who use the ED, urgent care and/or hospital services. Improvement Target: Baseline will be established in DY3, which is expected to be 1,445 targeted patients

identified as frequent users of ED services. The project seeks to refer at least 50% of this target population or 723 to a more appropriate primary care setting for follow up care in DY 4 and 70% of the original baseline referred to primary care in DY5.
I-8 Reduction in ED use by identified ED frequent users receiving navigation. Improvement Target: Baseline will be established in DY3 which is expected to be 723. The project seeks to realize a 2.5% reduction over baseline expected in DY4 and an additional improvement of 2.5% of the prior year in DY5.

Category 3 Outcome: IT-9.2 Appropriate ED Utilization. Improvement Target: Baseline will be established in DY3. Decrease utilization of ED patients from baseline by 2.0% in DY4 and an additional reduction of 2.0% over prior year in DY5.

IT-3.1 All cause 30 day readmission rate. Improvement Target: Baseline will be established in DY3. Decrease readmissions to the hospital from baseline by 1.5% in DY4 and an additional reduction of 3.0% over prior year in DY5.

These improvement milestones and outcomes support the project's objective to reduce utilization of high cost ED settings by placing frequent users of the emergency department into a more appropriate care setting.

Project Description

This project will provide patient navigation services in the Emergency Room to targeted patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will increase the number of people trained and deployed for innovative health services such as social workers. This project will connect patients to primary and preventative care and increase access to care management and/or chronic care management. This project should improve the utilization of unnecessary ED utilization as well as improve the health condition of those most at risk for costly chronic conditions.

Goals and Relationship to Regional Goals

The goal of this project is to utilize community health workers, case managers or other types of healthcare professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of care services. Patient Navigators will ensure that patients receive timely, coordinated and site appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the ED to site-appropriate locations. Implementing this project will identify health care workers, case managers or other types of health professionals needed to engage with patients in a culturally and linguistically

appropriate manner that will be essential to guiding the patients through the integrated health care delivery systems.
A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Challenges

Emergency Departments have become a vital source of care for those without insurance who generally lack a source of primary care, since they are required to evaluate and treat patients regardless of the ability to provide payment. Consequently, although care delivered through the ED is frequently for non-urgent problems, it is substantially more costly than care delivered in a more appropriate setting. DFW and National data indicate that the 26% of non-elderly individuals that are without health insurance exceeds the nearly 19% nationally of non-elderly individuals are without health insurance. These rates increase for individuals with lower incomes. Minority and low-income individuals without insurance generally lack a regular source of medical care, and suffer from medical conditions that are either preventable or easily treated in the outpatient setting. Consequently, the uninsured are four times more likely than the insured to forgo or postpone needed preventative care. The ED has become a societal solution for those with chronic conditions and/or lacking access to primary care. The patient navigation project will be focused on overcoming these societal challenges. Additional challenges will include the acquisition of professional resources that have a background and training to provide social services and navigation care services, as well as overcoming the reliance on personal accountability of the patient to follow up with a provider in a more appropriate care setting.

5-Year Expected Outcome for Provider and Patients

The expected outcomes for the patient navigation project are to:

- Identified frequent ED users and use of navigators as part of preventable ED reduction program.
- Trained health care navigators in cultural competency.
- Deployed innovative health care personnel such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connected patients to primary and preventative care.
- Increased access to care management and/or chronic care management, including education in chronic disease self-management.
- Decreased of inappropriate ED utilizations.

Starting Point/Baseline

Currently the baseline is zero. During DY2 frequent ED users will be identified based on a needs assessment to identify the patient population for which the program will be targeted. Patient navigation and care management will be provided to these patients. DY3 will serve as the baseline period for the project. Based on the number of patients served by the project, the number of providers trained to support the program will be identified and implemented.

Rationale

Emergency Department utilization in North Texas exceeds national utilization rates resulting in higher costs for providing care to the region. The Community Health Needs Assessment points to a lack of accessing primary care sites and the inability to redirect patients to a more appropriate care setting. The patient navigator project will provide resources to help patients and their families better locate and navigate appropriate care locations.

Project Components

The following core project components were selected because each component is designed to provide and improve navigation services to targeted patients who are at high risk of disconnect from institutionalized health care:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators

c) Connect patients to primary and preventative care

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management

e) We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Our milestones measure the reduction in the number of patients who frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED; 2) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of ED visits by those enrolled in the program by 5% by DY5. These milestones will meaure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

Unique Community Need Identification Numbers the Project Addresses

- CN.1: Demographics
- CN.2: Healthcare Infrastructure
- CN.8: Specialty Care
- CN.10: Oral Health
- CN.11: Patient Safety and Quality
- CN.13: Palliative Care

How the Project represents a new initiative

This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

There are two Related Category 3 Outcome Measures for this project. The first is Outcome Measure "Right Care, Right Setting" (OD-9) and IT-9.2 ED Utilization. Specifically there will be a reduction in all ED visits if the patient navigation program is effective. By identifying frequent users of the ED and providing navigation services, these patients will be exposed to alternative care locations that would be more effective for managing their non-urgent health conditions and health need. The IT-9.2 measures is the most appropriate indicator to assess the results of care experienced by patients, including patients' clinical events, patients' recovery and health status, patients' experiences in the health system, and efficiency/cost.

The second is Outcome Measure "Potentially Preventable Re-Admissions – 30 Day Readmission Rates" and IT-3.1 All cause 30 day readmission rate. The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the lack of chronic disease management and lack of access to appropriate sites of care. The patient navigator program will re-direct patients from the ED to a more appropriate care setting, where management of chronic conditions will be better suited. A reduction in frequent ED users and access to better care site for chronic conditions will lead to a reduction in readmission rates for those enrolled in the program.

Our milestones measure the reduction in the number of patients that frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED, 2) increasing the number of patient navigators available to provide services to those patients, and 3) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of ED visits by 3%. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

Relationship to Other Projects

126679303.2.2 Methodist Charlton Medical Center
135032405.2.3 Methodist Dallas Medical Center

This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1.1 (Preventable Admissions)-CHF Admission Rate
- RD-1.2 (Preventable Admissions)-Diabetes Admission Rate
- RD-1.4 (Preventable Admissions)-COPD/Asthma Admission Rate
- RD-1.5 (Preventable Admissions)-Hypertension Admission Rate
- RD-2.1 (Preventable 30 Day Re-Admissions)-CHF Re-Admission Rate
- RD-2.2 (Preventable 30 Day Re-Admissions)-Diabetes Re-Admission Rate
- RD-2.4 (Preventable 30 Day Re-Admissions)-COPD/Asthma Re-Admission Rate
- RD-2.5 (Preventable 30 Day Re-Admissions)-Hypertentsion Re-Admission Rate

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative
The RHP 9 projects related to patient navigation are as follows:

Performing Provider	Unique Project
Baylor Medical Center at Garland	121790303.2.3
Baylor Medical Center at Irving	121776204.2.3
Baylor University Medical Center	139485012.2.3

University of Texas Southwestern – Hospital	175287501.2.1

Plan for Learning Collaborative: We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Project Option 2.2.1 - Expand Chronic Care Management Models

Unique Project ID: 209345201.2.2
Performing Provider Name/TPI: Methodist Richardson Medical Center/209345201

Provider: Methodist Richardson Medical Center is a 209-bed facility in northern Dallas County serving a 245 square mile area and a population of approximately 740,000.

Methodist Richardson Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, nearly twenty-six percent of Methodist Richardson's patients were Medicaid eligible or uninsured representing $49 million in charges for those services.

Intervention: The primary purpose of this project is to develop and implement a chronic disease management intervention geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization.
This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Need for the Project: Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing.
More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Target Population: The target population is our ED patients that have either a principal or secondary diagnosis of diabetes and need education on managing diabetes and have high risk needs associated with diabetes based on clinical protocols of HbA1c >9.0%, , at least one ED visit in the past 12 months and/or have not received diabetes education within the past five years. Our annual ED visits are approximately 33,600. Those diagnosed with Diabetes as the primary or secondary diagnosis is 589.

Approximately 26% of our patients are either Medicaid eligible or indigent so we expect about 26% of the patients enrolled in the program to be Medicaid eligible or indigent.

Category 1 & 2 Expected Patient Benefit: I-17 Apply the chronic care model to targeted chronic diseases which are prevalent locally such as Diabetes. Of our target population, we expect 30% to be eligible or in need of a diabetes care model. Our baseline is zero as this is a new program at the hospital. In DY3 the goal is to begin providing care through the new program with 10 new patients receiving care under the chronic care management program by 9/30/14, increasing that number to 180 in DY4 with an additional improvement of 5% over DY4 in DY5.

I-18 Improve the percentage of diabetic inpatients with self-management goals. The baseline is zero as this is a new program at the hospital. The project seeks to improve number of diabetic ED patients with self-management goals from 0 to 5% of the target population (those identified above as eligible for the chronic care management program), or 9 patients in DY4 and an additional 5% or 18 patients in DY5.

Category 3 Outcome: IT-1.11 Diabetes care: Blood pressure control (<140/80mm Hg). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 25% of the 180 eligible expected to be in the program or 45 patients will have controlled blood pressure. Therefore, in DY4, the goal is to increase the number of target patients in the program with controlled blood pressure by 1.5% and an additional improvement in DY5 of 1.5% over DY4.

IT-1.10 Diabetes care: HbA1c poor control (>9.0%). Improvement Target: While the baseline is zero as this is anew program at the hospital, it is expected that 65% of the target population or 117 patients will have uncontrolled A1c level. Therefore, in DY4, the goal is to decrease the number of target patients in the program with uncontrolled A1c levels by 1.5% with an additional decrease of 1.5% over DY4 in DY5.

IT-3.3 Diabetes 30 day readmission rate. Improvement Target: The target population in DY4 for this program is expected to be 10000 patients. Historically, the diabetes readmission rate is 6.8%. Therefore, we expect the diabetes 30-day readmission rate among this target population to be 6.8% or 13 patients. In DY4, the goal is to decrease diabetes 30-day readmissions to the hospital from this target population by 10% with an additional 10% reduction over DY4 in DY5.

These outcomes support the project's purpose because if we do a better job of keeping people's blood pressure and HbA1C levels within appropriate limits, it will lower readmissions and the cost associated with managing chronic conditions of our patients.

Project Description

This project will apply evidence-based care management models for ED patients identified as having high-risk health care needs associated with diabetes. The project will develop chronic disease management education, protocols and self-management criteria for patients through a multi-disciplinary process. These protocols, once developed will be implemented in the hospital through new outpatient and inpatient education services, through the network of primary care physicians and made available to community clinics supporting diabetic patients. Historically,

patients that do not effectively manage their diabetes tend to develop chronic diabetes complications, co-morbidities and lead to higher utilization and costs related to health care services. This program will be implemented to help those who need education on managing diabetes and providing monitoring services where they are being treated. Patients will be identified by partnering with primary care physicians, community clinics and inpatient nurse managers. Patients identified as having high risk needs associated with diabetes will be based on clinical protocols of A1C>9, at least one ED visit in the past year and/or have not received diabetes education within the past five years.

Goals and Relationship to Regional Goals

The goal of this project is to develop and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. The purpose for implementing a chronic disease management program for diabetes is based on hospital and community data. Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Dallas county population having been diagnosed with diabetes. The development and implementation of chronic disease management interventions for diabetes will lower costs and improve outcomes for the diabetic patients and community health status.

A major goal of the region is to improve the rate of chronic disease self-management and education. This project will contribute to that goal by providing patient education resources based on clinical management protocols.

Challenges

Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment. Hispanics are 1.5 times as likely to develop diabetes as non-Hispanic populations according to the CDC. Effective communication and creativity in reaching this community demographic has been identified as a challenge for this project.

5-Year Expected Outcome for Provider and Patients

- Formed multi-disciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
- Developed a comprehensive diabetes care management program
- Developed and implemented plan for standing orders for diabetes patients

- Trained staff in the Chronic Care Model, including essential components of a delivery system that supports high-quality clinical and chronic diabetes management, and on the standing orders for diabetes patients
- Developed and implemented OP Diabetes Education Clinic and IP Educator program to assist patients to better self-manage their chronic diabetes
- Improved number of patients with self-management goals
- Improved number of patients being treated under the Chronic Care Model and/or Standing Orders for Diabetes

Starting Point/Baseline

Diabetes related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Tarrant county population having been diagnosed with diabetes. The hospital currently does not offer outpatient diabetes education clinic services nor inpatient diabetes education. During DY2 and DY3 as the chronic health management program and clinical protocols for standing orders are developed, target populations will begin to be identified. Historically, the ED has seen approximately 589 patients that also have a principal or secondary diagnosis of diabetes. We expect to target 30% of those with the program; 25% (or 45) are expected to have controlled blood pressure and 65% (or 117) uncontrolled A1c levels >9.0%.

Rationale

Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing. More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

Project Components

The following core project components were selected because they are sequential steps necessary to implement the project and each is designed to apply evidence-based care management model to patients identified as having high-risk health care needs related to diabetes.

a. We will design and implement multi-disciplinary teams that are tailored to the patient's health care needs to include clinical nursing, physician representation as well as members from finance, patient education and existing employee medical home leadership.

b. Patients enrolled into the program will receive contact information from patient navigators to ensure that patients can access their care teams in person, phone or email

c. An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital's current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

d. Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions.

e. We will conduct ongoing quality improvement efforts for the project. The hospital's quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.

Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Unique Community Need Identification Numbers the Project Addresses:

CN.9: Chronic Care

How the Project represents a new initiative

This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

Related Category 3 Outcome Measure(s)

- IT-1.10: Diabetes Care: HbA1c poor control (>9.0%)
- IT-1.11: Diabetes Control: Blood pressure control (<140/80mm Hg)
- IT-3.3: Diabetes: 30-day Readmissions Rate

There are three Related Category 3 Outcome Measures for this project. The first two fall within Outcome Measure "Primary Care and Chronic Disease Management" (OD-1). Specifically the two Improvement Targets are IT-1.10 (Diabetes Care: HbA1c poor control (>9.0%)) and IT-1.11 (Diabetes Control: Blood pressure control (<140/80mm Hg)). This project will identify patients in the ED who are identified as having poor diabetes control. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market ultimately leading to better diabetes control outcomes.

The third Related Category 3 Outcome Measure falls within the Outcome Measure "Potentially Preventable Re-Admissions – 30-Day Readmission Rates" and IT-3.3 Diabetes 30 day readmission rate. This project will identify ED patients who have poor diabetes control and ultimately at high risk for readmission to the hospital. Based on the project's efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market. Better preparing patients for self-management, education and ongoing support for diabetes care will ultimately lead to reduced diabetic re-admissions from this target population.

Our process milestones measure the development of chronic care management program for diabetes, training and education of care givers in multiple care sites, development of standing orders for diabetic patients and the development of a new Outpatient Diabetes Education service and new Inpatient Educator program. The Improvement milestones measure the number of individuals that will targeted for the education and self-management protocols, as well as the increased number of patients with self-management goals. The specific improvement targets for the number of patients provided services for education and the number of patients with self-management goals will be determined during DY2.

Relationship to Other Projects

- 126679303.2.1: Methodist Charlton Medical Center
- 135032405.2.2: Methodist Dallas Medical Center

This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1.2 (Preventable Admissions)-Diabetes Admission Rate
- RD-2.2 (Preventable 30 Day Re-Admissions)-Diabetes Re-Admission Rate

- RD-4.2 (Patient Centered Healthcare)-Medication Management

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

The RHP 9 projects regarding chronic care management are as follows:

Parkland Health &Hospital System	127295703.2.4	Expand Chronic Care Management Model – Diabetes (retinal eye exam; 30-day readmissions)
Texas Health Presbyterian Hospital Denton	020967801.2.2	Expand Chronic Care Management Model: Diabetes (HbA1c poor control, 30 day readmissions)
Texas Health Presbyterian Hospital Kaufman	094140302.2.2	
UTSW – Faculty Practice Plan	126686802.2.2	Expand Chronic Care Management Model (Diabetes: HbA1c control; All Cause Readmissions)

Plan for Learning Collaborative. We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Healthcare cost/benefit. An Individual impact valuation is determined by applying an "impact" rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Healthcare value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an

annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A "reasonableness" assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Project Option 2.1.1 – Enhance/Expand Medical Homes

Unique Project ID: 127295703.2.1

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. While Parkland's overall payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance, the Community Oriented Primary Care (COPC) clinic network's payer mix includes 62% Charity/Self Pay and 20% Medicaid.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention: Based on established criteria, Parkland will enroll patients into medical homes throughout the COPC network with specific physicians/care teams. This reorganization will require identification of potential medical home patients and provide care based on strict guidelines, such as the 2011 PCMH standards as identified by NCQA. Parkland will establish criteria, assign patients to medical homes and will connect patients in the hospital to medical homes through improved hospital care coordination including patient navigation and care transitions programs. Once assigned, patients will be managed utilizing the PCMH standards to improve their care and patient experience.

Need for Project: Parkland COPC clinics care for approximately 120,000 individuals (through approximately 400,000 visits per year). Of these, 40% have been identified initially to enroll in a medical home. This would reduce unnecessary utilization of the ED and other services (more than 12,000 adults and 12,500 children were seen at least 3 times at the COPCs in 18 months).

NCQA raised the bar with its PCMH 2011 Primary Care Medical Home recognition program and in a 2011 press release, NCQA stated the following: [317]

> "We revised the standards to be clearer and more specific, and some practices may find the program more challenging. Through a comprehensive review of new evidence on effective care practices, NCQA PCMH 2011 Advisory Committee discussions, feedback on our earlier programs and a public comment period, we have taken the program to a new level. Robust patient centeredness is an important program goal:
>
> - Stronger focus on integrating behavioral healthcare and care management
> - Patient survey results help drive quality improvement
> - Patients and their families are involved in quality improvement
>
> We have added a new, standardized patient experience survey and an accompanying standardized methodology."

The new standards have added significant changes that require process improvements for all of the COPC practices. Several elements were enhanced and new requirements were developed, all of which require significant practice changes throughout Parkland's community-based clinics where 120,000 individuals are cared for annually.

Target Population:

The target population for enrollment in the medical home model will be defined by established criteria. It is anticipated that initially 25,000 patients will be enrolled (82% of COPC patients are Medicaid/indigent patients). It is anticipated to enroll approximately 60,000 patients in a medical home model by DY5.

Category 1 & 2 Expected Patient Benefits: Patients assigned to a medical home will be better managed and prompted to utilize preventive services. This will reduce unnecessary ED visits and potentially preventable admissions and readmissions.

Category 3 Outcomes: The FY2016 outcomes for this project include:

- IT-1.2: Annual monitoring for patients on medications: ACE inhibitors or ARBS
    - Goal is to increase number of monitored CHF and Diabetes Patients
        - CHF: 83.7% (605 patients in FY12) to 88%;
        - Diabetes: 82.5% (2,282 patients in FY12) to 88%
- IT-1.12: Diabetes care: Retinal Eye Exam. Goal is to increase number of COPC patients who receive from 0 to 3,000

[317] National Committee for Quality Assurance. "NCQA's Patient-Centered Medical Home (PCMH 2011)." White Paper. Jan 2011.

- IT-1.20: Other - % patient who by age 13 years up-to-date with recommended immunizations: 1) MCV4 and 2) one Tdap/Td. Goal to increase to 80% compliance. (1,617/2,456 = 66% compliance in FY2012)

Project Description

Parkland will expand the medical home model throughout its COPCs by empaneling patients, identifying and extending care management to high risk/complex patients, sufficiently building the tracking and follow up systems to enhance referrals, and expanding reporting capabilities to provide physicians and care teams with information to improve care provided.

Such an elevation in performance will also provide Parkland the opportunity to achieve NCQA designation under the Patient-Centered Medical Home (PCMH) 2011 Program.

With twelve Community Oriented Primary Care (COPC) health located throughout Dallas County, Parkland is the largest provider of primary care for the population living at or below 200% of poverty, with approximately 120,000 individuals being seen in its primary care clinics (400,000 annual visits). At capacity already, the clinics must assess its abilities to identify patients and better monitor and manage care based on their specific medical home needs in hopes of improving outcomes and reducing unnecessary utilization of the care delivery system.

The 2011 PCMH standards require substantial changes/improvements in the current care model at Parkland's twelve COPC clinics including the following:[318]

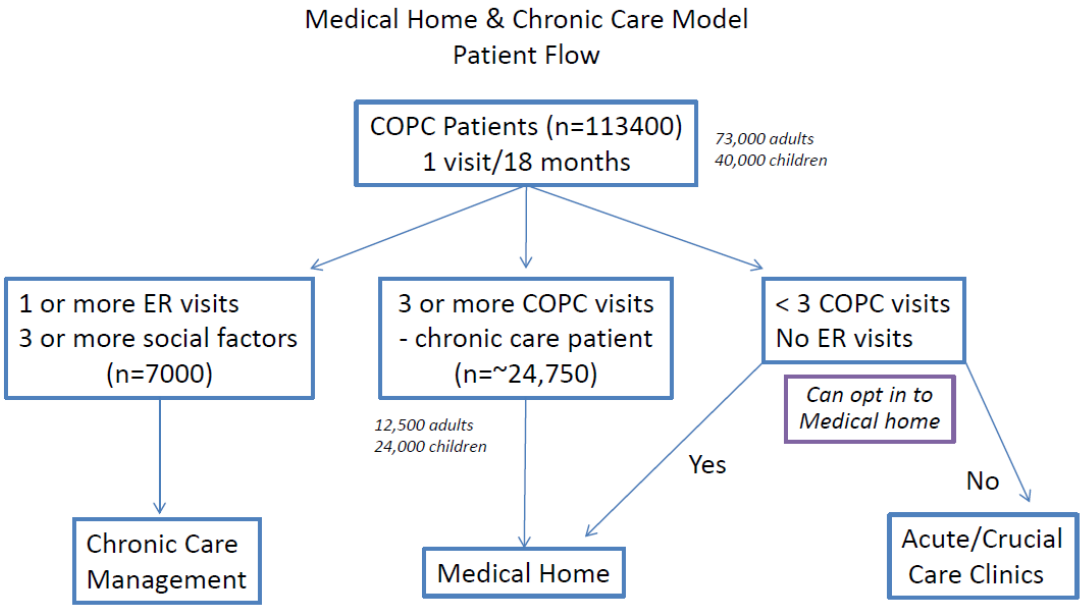
- Extends requirements of the primary care clinics and providers including offering extending hours of availability and electronic access to care teams
- Expands requirements for culturally linguistically appropriate services (CLAS)
- Expands Population Management
  - Requires identification of high risk/complex patients (new)
  - Asks practice to identify patients not recently seen by practice
  - Requires additional preventive care services and chronic care services
  - Includes preventive service reminders from PPC 3B
- Expands Care Management
  - Includes high-risk patients (new)
  - Record review increases from 36 to 48 patients
  - Requires provider to provide patient/family with clinical summary of visits
- Requires provision of referrals to Community Resources (new)
  - Requires practice to develop resource list on five key topics/key services of importance to patient population and to track referrals

[318] National Committee on Quality Assurance. 2011.

- Asks practice to arrange for or provide treatment for mental health and substance abuse disorders
- Requires offering opportunities for health education programs

- Requires additional Referral Tracking and Follow-Up including:
  - Establishing agreements with specialists
  - Electronic communication with specialist
- Requires additional categories of measurement: coordination, whole person care/self-management support in survey of patient experience
- Requires demonstrated Continuous Quality Improvement and emphasizes evaluation quality improvement by tracking results over time (new)
- Requires more specific alignment to Meaningful Use (new)
- Requires additional reporting of ambulatory clinical quality data, immunization data to registries/systems, syndromic surveillance data

To meet these requirements and build stronger relationships between care teams and patients, Parkland intends to assign patients to medical homes, monitor and track care and provide support to patients to better self-manage their conditions. The manner in which patients will be enrolled in a medical home and chronic care model is illustrated below:



Goals and Relationship to Regional Goals

The goal of this project is to expand the medical home concept through care management of patients who need primary and preventive services and can benefit from a medical home. Care management will be achieved through medical home care teams located at the COPC sites

throughout Dallas County. Objectives include: design and implementation of structural/ operational/ practice changes, conducting educational sessions for primary care physicians, care teams and specialists regarding elements of PCMH, its rationale and vision and collaborating with clinicians across the system in utilizing the medical home model in caring for a patient population.

This project relates to regional goals by improving access to primary care for all patients including those with low incomes and also improving care management of patients with chronic care needs through an evidence-based systematic care model such as that of the Patient-Centered Medical Home.

Challenges

Parkland has community-based practices that are currently providing care to patients beyond capacity and enrolling everyone who seeks care at Parkland in provider panels is not feasible. This project will focus efforts on identifying patients who require care through a medical home model.. This will require some shift in the health system's ability to provide acute care for those patients who do not want to be enrolled in a medical home but do require services from time to time.

Additionally, implementing the medical home model requires changing practice patterns and extensive disruptions to operations while providing care in an already over-burdened primary care system.

Another challenge is the intention/motivation of the patients. Parkland cares for many indigent and Medicaid patients and some of those patients will be willing to work with physicians and care teams to better self-manage their conditions and be compliant with treatment. Others may not be as compliant and may seek care as they need it in whatever setting (such as the ED). Providers may have every intention to manage the care for patients and work with patients to self-manage, insure referrals are made and care is monitored, but without the patient's commitment, there is little chance for success.

While the increased burden is challenging, Parkland is committed to PCMH principles and fully intends to focus efforts on improved care through standardized approaches to care, increased capacity and improved communications between providers and patients. Establishing criteria for enrollment, obtaining agreement between patients and providers to work through a medical home model, and following the NCQA 2011 PCMH guidelines in providing care will provide the best foundation for success.

5-Year Expected Outcome for Provider and Patients

Parkland will establish criteria for medical home assignment and track patient assignment of selected chronic care and prevention services to designated care teams. This will ensure that not only are more patients enrolled in medical homes, but their care is being tracked and

monitored to ensure the most appropriate care is being provided at the right time and in the right setting and that improvements in care are possible in time.

Another outcome is a better balance in the patients seen in the COPC who are enrolled in the medical home and those who use care infrequently and require little follow up. This will provide physicians the opportunity to see those patients who are enrolled in medical homes while the health system will direct patients with limited needs to another site, possibly the Acute Response Clinic (which is another project submitted for the waiver).

Starting Point/Baseline

In FY2012, Parkland provided care to 120,000 individuals (395,479 visits) in the COPC clinics. While many patients are eligible for enrollment in a medical home, initial focus will be on patients who meet specific criteria including utilization and chronic needs. The baseline is zero with 25,000 patients identified for initial enrollment.

Rationale

The Patient-Centered Primary Care Collaborative recently published its 2012 review of 46 medical home initiatives throughout the United States, *Benefits of Implementing the Primary Care Patient-Centered Medical Home: A Review of Cost & Quality Results*, which provides evidence that the patient-centered medical home model reduces costs and spending by reducing admissions and readmissions to hospitals and ED utilization.[319] Each initiative had some success, while most had significantly improved outcomes for patients. For WellMed in San Antonio, Texas, there was evidence of improved preventive care and disease management including:

- Increased control of HbA1C levels from 81% to 93% of diabetes patients
- Increased LDL levels under control, from 51% to 95%, for heart disease patients
- Improved diabetes HbA1c testing from 55% to 71%
- LDL screenings for all patients increased from 47% to 70%
- LDL screenings for diabetic patients increased from 53% to 78%

In its second year, Group Health Cooperative's Medical Home found implementation of a medical home concept resulted in cost savings, higher patient satisfaction and less provider burnout. The study found the enrolled patients had 29% fewer ED visits and 6% fewer hospitalizations.[320] Additionally, Group Health determined the return on investment was 5:1 (for every $1 they spent on implementing the PCMH model, they received a return of $1.50).

[319] Patient-Centered Primary Care Collaborative. *Benefits of Implementing the Primary Care Patient-Centered Medical Home: A Review of Cost & Quality Results. 2012.*

[320] Reid, RJ, et al. "The Group Health Medical Home at Year Two." Health Affairs 29, No. 5. 2010. P 835-843.

Parkland is making significant investments to increase capacity in primary and specialty care and to improve care coordination of inpatient/outpatient services. All of these efforts must connect the care delivery system for patients. The implementation of the electronic medical record and other investments in resources are foundational to improve communication and tracking of patients across the care continuum. Through these efforts, data will be reported that identifies high utilizers of services. Those patients, if they meet criteria, can be placed in a medical home that will improve care and reduce unnecessary use of other services.

Parkland has committed to meeting the new and more challenging 2011 PCMH standards in order to better meet the needs of this highly complex patient population. The 2011 standards for Patient-Centered Medical Home are grouped as follows[321]:

1) Improve Access/Continuity
2) Manage Patient Populations
3) Plan/Manage Care
4) Support Self-Care/Community Resources
5) Track/Coordinate Care
6) Measure/Improve Performance

Project Components

Parkland proposes to meet all required project components for this project including:

a. Utilize a gap analysis to assess and/or measure hospital-affiliated PCPs' NCQA PCMH readiness. *Parkland COPC leadership including physicians and other care team members will determine operational readiness to meet 2011 NCQA PCMH standards*.

b. Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status. *As the operational readiness assessment is completed, Parkland COPC leadership will determine appropriate steps to be taken to meet 2011 standards and develop a plan.*

c. Conduct educational sessions for primary care physician practice offices, hospital boards, medical staff and senior leadership on the elements of PCMH, its rationale and vision. *As the plan is implemented, providers and care team members will conduct sessions to educate physicians and care teams at other clinics regarding the PCMH model. Education will be ongoing and done regardless of achievement of recognition due to Parkland's commitment to the medical home model for its patient population.*

d. Conduct quality improvement for projects using methods such as rapid cycle improvements and participation in the regional learning collaborative. *This will be done*

[321] National Committee for Quality Assurance. Patient-Centered Medical Home Standards. 2011.

through collaboration with specialists and other primary care providers as well as hospital care transitions teams.

Milestones and Metrics

- P-2: Put in place policies and systems to enhance patient access to the medical home. Enhanced access to care is available through systems such as open scheduling, expanded hours and options for communication between patients, their personal physician and practice staff
    - P-2.1: Performing Provider policies on medical home
- P-6: Establish Criteria for Medical Home assignment for selected chronic care patients.
    - P-6.1: Determine criteria for Medical Home assignment
- P-7: Track assignment of patients to designated care team
    - P-7.1: Tracking Medical Home Chronic Care Patients
- P-11: Identify current utilization rates of preventive services and implement a system to improve rates among targeted population
    - P-11.1: Implement patient registry
- P-13: Review project data & respond with tests of new ideas, practices, tools, solutions
    - P-13.1: Number of new ideas, practices, tools, solutions tested
- I-12: Based on criteria, improve number of eligible patients assigned to medical home
    - I-12.1: Number of eligible patients assigned to a medical home, where "eligible" is defined by Provider
- I-17: Medical home provides population health management by identifying and reaching out to patients who need to be brought in for preventive and ongoing care
    - I-17.1: Reminders for identified patients 65 and over needing their pneumococcal vaccine
    - I-17.1: Number of diabetic patients receiving retinal exams in measurement year

Unique Community Need Assessment Identification Number:

- *CN.3 – Health Care Capacity*
- *CN.4 – Primary care and Pediatrics*

Why this is a significant enhancement to the current delivery reform initiative

This initiative will be a significant enhancement to Parkland's medical home model by meeting the more challenging 2011 PCMH standards and empaneling patients to improve care coordination and management.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.2: Annual monitoring for patients on persistent medications - ACE inhibitors/ARBs
- IT-1.12: Diabetes care: Retinal eye exam
- IT-1.20: Other: percentage of patients who by age 13 years were up-to-date with recommended adolescent immunizations: MCV4 and Tdap/Td

Annual monitoring for patients on persistent medications. Parkland has a significant number of patients on chronic medications needing to be monitored to decrease risk of adverse drug events from long-term medication use or misuse of medications. Persistent use of ACE Inhibitors or ARBs warrants monitoring and follow-up by the medical home to assess side-effects (i.e. loss of kidney function), and adjust drug dosage/therapeutic decisions accordingly.[322]

Diabetes: Retinal Eye Exam. Diabetic retinopathy, one of the leading causes of blindness in adults, can be treated if detected and addressed in the early stages.[323]

Primary Care and Prevention: Adolescent Immunizations (NQF 1407).[324] National Quality Forum Endorsed Measures include the following recommended immunizations for patients by age 13:

- TDaP vaccine which protects against tetanus, diphtheria and pertussis
- Meningococcal conjugate vaccine, which prevents meningococcal disease (10-14% of invasive meningococcal infections are fatal, and 11-19% result in long-term disability such as deafness, brain damage, or an amputated arm or leg)

Intervention: Parkland will incorporate into its care delivery system a chronic care model based on the Wagner Chronic Care Model,[325] modified, as appropriate, for Parkland's low income patient population.

Need for the Project: The need for better management of patients with chronic conditions is high in the region and at Parkland specifically. It has been estimated that 30,000 of Parkland's patient population are diabetic. Creating the registry as identified in a related project will allow Parkland to identify these patients ~~as well as patients~~ with other chronic conditions for proactive management. Proactive management of patients with chronic disease can improve

[325] Wagner, E, Austin, B, Davis, C, Hindmarsh, M, Schaefer, J, Bonomi, A. "Improving Chronic Illness Care: Translating Evidence into Action." Health Affairs, Volume 20, Number 6. 2001.

the quality of life for patients as well as decrease high cost utilization within the healthcare system such as in the ED.

Target Population: Initially, Parkland will focus on enrolling patients with Diabetes, Congestive Heart Failure (CHF) into a chronic care model. In subsequent years, patients with other conditions – Chronic Kidney Disease (CKD), COPD, Hypertension, pediatric asthma, pediatric obesity – will be enrolled into the chronic disease management model. Initial projections estimate those to be enrolled in a chronic care model at 15,000-20,000 by DY5.

Category 1 & 2 Expected Patient Benefits: The goal is to increase the number of patients who are enrolled with a care team and cared for utilizing an evidence-based care model.

Category 3 Outcomes: Parkland has identified the following FY2016 clinical outcomes:

- IT-1.2: Annual monitoring of patients on persistent medications (ACE inhibitors/ARBs)
    - Goal: Increase the number of monitored patients on persistent medications
        - CHF: 83.7% (605 patients in FY12) to 88%;
        - Diabetes: 82.5% (2,282 patients in FY12) to 88%
- IT-1.12: Diabetes: Retinal eye exam
    - Goal (COPCs): Increase number of patients who receive exams from 0 to 3,000
    - Goal (Family Medicine): Increase percentage of patients who receive eye exams from 48% (235/483 patients in FY2012) to 80%
- IT-3.3: Diabetes 30-day Readmission Rate
    - Goal: Decrease the rate of readmissions from 9.2% (117 in FY12) to 8.7%

Project Description

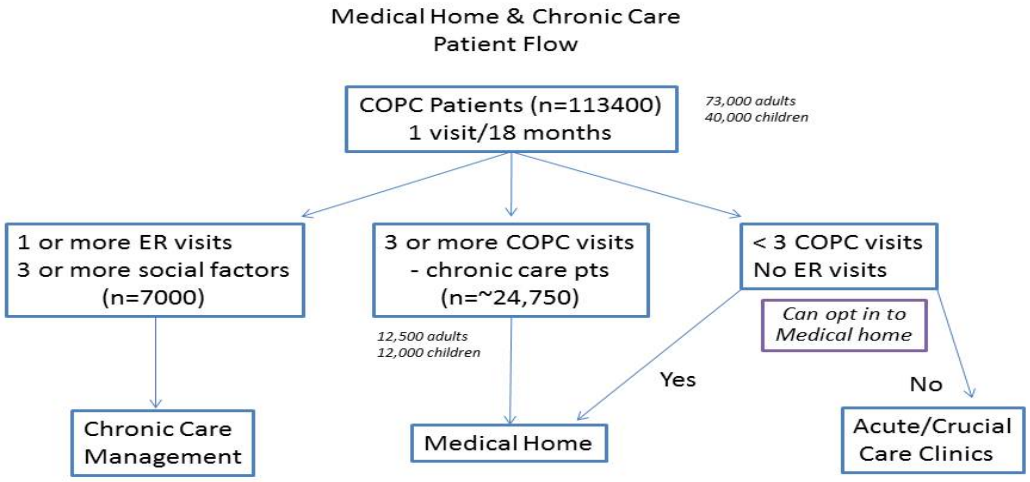
Parkland will incorporate evidence-based chronic care model into practice for patients with specified chronic conditions.

Based on evidence-based care models, a team of providers will focus efforts on the implementation of a Chronic Care Model for management of diabetes, chronic kidney disease and congestive heart failure for Parkland's patients. A Chronic Care Model developed by Edward H. Wagner has been widely accepted for its success and is categorized into four elements: 1) increased provider expertise and skill, 2) educating and supporting patients, 3) making care delivery more team-based and planned, and 4) making better use of registry-based information systems[326]. As Parkland incorporates a chronic care model, elements of the Wagner model will be incorporated as appropriate.

[326] Katie Coleman, Brian T. Austin, Cindy Brach and Edward H. Wagner., "Evidence On The Chronic Care Model In The New Millennium," *Health Affairs*, 28, no.1, 2009:75-85.

The physicians leading this effort established a pilot project to implement a chronic care model for CHF patients and are expanding that pilot to other sites as well as expanding the targeted chronic conditions. Care teams (physicians and non-physicians) will be placed within the community practices where primary care is provided and will have access to patient stratification tools, a registry and other information systems to assist in their provision of care as well as provide results-oriented information for continued improvement of the model. Additionally, patients will be provided information and tools to assist in self-management of their conditions.

The manner in which patients will be enrolled in a medical home and chronic care model is illustrated below:



Goals and Relationship to Regional Goals

The goal of this project is to implement a chronic care model that provides a framework for care teams including interventions to improve outcomes for patients with chronic conditions.

Regional goals include improved access to care, improved care coordination and management and improved provider performance and outcomes. This project will support coordination of care through an established model for patients with specified conditions. Registries will be set up to monitor and track progress. Care teams will be established to include physicians and other clinicians as well as representatives from nutrition, pharmacy, social services, etc. Establishment of such a care model will provide downstream benefits including a reduction of capacity constraints by reducing the number of unnecessary ED visits and readmissions

Challenges

Nationally 57% of people with chronic conditions are privately insured but have significant out-of-pocket costs, 85% of the Medicare elderly have chronic conditions and more than 8 million people who have chronic conditions are uninsured.[327] Providing adequate care to people with chronic conditions is an extensive effort as such conditions impact people's physical and mental health and their social and professional lives. The question no one can answer is who should coordinate and finance "life care" for those with chronic conditions. Health care providers can only provide support to patients while they are being treated within the system. Contributing to that question, other major challenges in implementing a chronic care model are as follows:

1) Parkland's patient population, having less access to resources at home and within the community, may be less likely to follow stringent self-management plan for their conditions. Indigent patients have limited resources and may be required to choose between needs for themselves and possibly their families as living "paycheck to paycheck" proves true.

2) There is a lack of community resources for patients who need chronic care management. Studies have shown there are few health store options and or gyms/parks in areas where Parkland's patients reside. Without community resources, patients have fewer opportunities to care for themselves. While community resources are factor for success, support for community organizations is limited and the economic model to support preventive care does not exist.

4) Parkland has capacity constraints at every entry point. Some community practices have wait times for appointments 9-12 months out. In order to implement such a model, several things must occur simultaneously. For example, chronic patients must be identified and those patients must then be enrolled with care teams who may already have patients scheduled months out. Rearranging provider schedules and care teams is a significant undertaking as Parkland sees more than 15,000 outpatient/ambulatory visits on any given day.

5-Year Expected Outcome for Provider and Patients

~~The pilot goal is to have 3,500 patients enrolled in a registry and set up with a care team for chronic care management.~~ Expected outcomes for patients enrolled in a chronic care model will be improved patient outcomes and improved quality of life for patients with chronic conditions such as Diabetes and CHF. Providers will utilize guidelines for evidence-based care protocols for specific conditions that will provide point of care, between care and post care interventions insuring the patient's care is planned and objectives of care are met even between visits.

<u>Starting Point/Baseline</u>

[327] Johns Hopkins Partnership for Solutions. "Chronic Conditions: Making the Case for Ongoing Care". Sept 2004 Update.

Because the Chronic Care Model has not been implemented yet, the starting point/baseline is zero (0). The initial pass of potential patient candidates for enrollment in a chronic care model includes 7,000 diabetic and CHF patients who have utilized the COPC network 3+ times in 18 months. Additionally, 6,500 pediatric patients have been identified with asthma or obesity for an estimated total of 13,500 patients as a "target" base.

Rationale

According to the Centers for Disease Control approximately 133 million Americans (nearly 1 in 2 adults) live with at least one chronic illness and the percentage of U.S. children and adolescents with chronic health conditions has increased from 1.8% in the 1960s to more than 7% in 2004.[328]

With more than 75% of health care costs due to chronic conditions[329], the health care delivery system must decipher the need by condition in order to make any significant contributions to improved care. According to the Healthcare Advisory Board, over the last 25 years the largest growth in health care costs for chronic disease has shifted among conditions, from heart conditions, COPD and mental disorders (1987-1997) to cancer, hypertension, chronic kidney disease and diabetes (1997-2007), with the largest increase in costs attributed to diabetes[330]. The American Diabetes Association states the national cost of diabetes exceeds $174 billion including $116 billion in excess medical expenditures and $58 billion in reduced national productivity.[331] People with diagnosed diabetes, on average, have medical expenditures that are approximately 2.3 times higher than the expenditures would be in the absence of diabetes Indirect costs of diabetes include factors related to absenteeism and reduced productivity.

Parkland has approximately $1.1 billion in annual operating revenues and $1.5 billion in annual operating costs, thus the cost-effectiveness of incorporating a chronic care model in provider practices is imperative. One study performed through extensive literature review of other intervention studies incorporating a chronic care model found that utilization of a chronic care model was cost-effective and provided improved outcomes.[332]

Other research showed that interventions based on chronic care model components improved at least 1 process or outcome measure for diabetic patients. Another study in Pennsylvania for the underserved population indicates that the patients who were seen at a site that followed CCM had improved HbA1C levels, non-HDL cholesterol levels and rates of self-monitoring of blood glucose.[333] The study indicated patients were significantly more likely to report having received preventive procedures, tests, foot and eye exams and medication reviews. The ED utilization measured by average ER visits per year was lower for those after 24 months of

[333] Wagner EH et al. "Chronic Care Clinics for Diabetes in Primary Care." *Diabetes Care*, No.4, April 2001: 695-700.

initializing these CCM interventions. Regarding whether chronic care model interventions can reduce costs, 18 of 27 studies concerned with 3 examples of chronic conditions (congestive heart failure, asthma, and diabetes) demonstrated reduced health care costs or lower use of health care services.[334]

Project Components

a) Design and implement care teams that are tailored to the patient's health care needs. *Care teams will be established as patients are identified, enrolled and needs are assessed.*

b) Ensure that patients can access their care teams in person or by phone or email. *As the care teams are established, accessibility will be addressed and patients will be notified.*

c) Increase patient engagement through patient education, group visits, self-management support, improved patient-provider communication and coordination with community resources. *While this is imperative to success of the model, there must be some innovative methods to assist those patients who may be less compliant in self-management*.

d) Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions. *Parkland patients have access to MyChart (self-management tool) but require education regarding the tool. Patients will also have access to primary and preventive care that can be coupled with other Parkland services including ADA-certified diabetes self-management classes and pharmacy services provided by pharmacists who are certified diabetes educators*.

e) Conduct quality improvement for project using methods such as rapid cycle improvement. *As the chronic care model and registry proves successful, patients with other conditions will be included working with hospital care transitions teams, primary and specialty care faculty and the Clinical Innovations Center to expand the models for other conditions.*

Milestones and Metrics

- P-3: Develop a comprehensive care management program
    - P-3.1: Documentation of care management program
- P-1: Expand chronic care model to primary care clinics
    - P-1.1: Increase # primary care clinics using chronic care model
- P-4: Formalize multi-disciplinary teams, pursuant to chronic care model defined by Wagner Chronic Care Model or similar

[334] Thomas Bodenheimer, MD; Edward H. Wagner, MD, MPH; Kevin Grumbach MD. *JAMA.* 2002; 288(15):1909-1914.

    - P-4.1: Increase number of multi- disciplinary teams or number of clinic sites with formalized teams
- P-9: Develop program to identify and manage chronic care patients needing further clinical intervention
    - P-9.1: Increase number of patients identified as needing preventive tests or other clinical services
- P-15: Review project data and respond with tests of new ideas, practices, tools, solutions
    - P-15.1: Number of new ideas, practices, tools, solutions tested
- I-17: Apply Chronic Care Model to targeted chronic diseases, which are prevalent locally
    - I-17.1: Increase number of additional patients who receive care under CCM for chronic disease

Unique Community Need Identification Numbers the Project Addresses

- *CN.9 – Lack of Care Coordination for Chronic Disease*. For ED utilization in the region within the top seven diagnoses, 20-45% had an underlying condition of diabetes and the top condition for ED use among Medicaid and the uninsured adults was diabetes between 2010Q3 and 2011Q3.

How the Project represents a new initiative

This project is a new initiative and provides a new opportunity to establish an evidence-based chronic care model to be incorporated into physician practices at Parkland.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Care Management
- IT-1.2: Annual monitoring of patients on persistent medications (ACE inhibitors/ ARBs)
- IT-1.12: Diabetes: Retinal eye exam (NQF 0055)

OD-3: Potentially Preventable Readmissions
- IT-3.3: Diabetes 30-day Readmission Rate

Reasons/Rationale for selecting outcome measures

Diabetes has been identified as the initial focus for implementation of the Chronic Care Model. It has been estimated that approximately 10% of Parkland's patients are diabetic thus lending

itself to establishment and implementation of a chronic care model around diabetes management.

Diabetes is one of the most costly and prevalent chronic disease in the United States. Recent estimates have shown that patients with HbA1c > 9.0 had on average $5,000 in hospital costs, while those with a lower HbA1c (<7.0) had only $2,700 in hospital costs.[335] In Texas, diabetes affects 10% of the population (national average 8%) and in Dallas County diabetes affects 11.4% of the population.

Relationship to Other Projects

Parkland intends to balance the care continuum to insure those patients who need a medical home and/or require care through a chronic care model have access and also assure that the patients who do not need a medical home but require occasional medical care also receive the care they need in the right setting. All Parkland projects address a key component of the care continuum that must be addressed to find the right balance. This balance will insure all patients get the right care at the right time in the right place

A key element of a chronic care model is the utilization of patient data through a patient registry and so the registry project will be implemented with this project. Other related projects include the following:

Unique Project	Option	Project Description
127295703.2.1	2.1.1	Expand medical home model (COPCs)
127295703.1.3	1.3.1	Implement a chronic disease registry

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational *impact*, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted score of 8.7 on a 9.0 scale. Factors that influenced this score included:

- The strong impact this project will have with respect to managing, at the health system level, the patients among Parkland's vulnerable population affected by chronic disease and at highest risk for costly health exacerbations
- Alignment with the community need for chronic disease management
- Cost avoidance by providing increased opportunity for patients in this community to obtain the right care in the right place at the right time
- Opportunities for partnership and collaboration with the many performing providers in **RHP** 9 that are pursuing the chronic disease management projects

Health Management Associates (HMA) published a paper in November 2008 that surveyed the literature with respect to evidence of savings associated with chronic disease management.[336] The paper indicates evidence that chronic disease management programs can yield savings

[336] Chronic Disease Management: Evidence of Predictable Savings, Health Management Associates; Jack Meyer, PhD and Barbara Markham Smith, JD November 2008.

ranging from 2.72 to 32.7 dollars saved per dollar invested. The paper also notes that costs tend to be relatively modest, ranging from $100 to $1399 per capita. These factors are extended with respect to the Parkland enrollment targets in the table below.

Parkland Program Enrollees	Potential Per Capita Program Costs	Ratio of Dollars Saved to Dollars Spent	Potential Value Range
10,000	$100 - $1399	2.72 to 32.70	$2,720,000 – $457,473,000
15,000	$100 - $1399	2.72 to 32.70	$4,080,000 – $686,209,500

The range of potential value is extremely wide, but demonstrates the potential for significant value to be produced by the design and implementation of organized chronic disease/condition management programs.

Project Option 2.5.2 – Assess Cost Effectiveness of Continuum of Care Alternatives

Unique Project ID: 127295703.2.5

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Total Adult	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Parkland directly employs approximately 150 primary care physicians (pediatrics, family medicine, internal medicine) who provide services in the community health centers. Campus based physician services are provided mainly by UT Southwestern Medical Center faculty under a services contract.

Intervention: Implement a cost accounting system and develop a standardized, evidence-based methodology to determine cost effectiveness. Use the assessment of post-acute continuum resources as the pilot for the new system and methodology. The standardized methodology and associated tools will be used to inform care continuum related decisions that will impact the entire Parkland system and the approximately 290,000 individuals it serves. As a safety-net

system, the majority (approximately 80%) of the patients impacted will be Medicaid and Indigent.

Need for the Project: While the Parkland system exists to furnish care to the low income residents of Dallas County, the demand for patient care services far exceeds the capacity of the system. It is important that Parkland establish the tools and methodologies to assure that its resources are being directed in the most effective way possible. This project is designed to implement the cost accounting tools that will support the development of a standardized, evidence-based methodology for informing effective resource allocation decisions.

Target Population: The target population includes the low income residents of Dallas County who are encompassed by Parkland's mandate.

Category 1 & 2 Expected Patient Benefits: The Parkland system will have the basis to inform decisions to allocate resources to best serve the low income residents of Dallas County

Category 3 Outcomes: The FY2016 outcomes for this project include:

- IT-5.1: Improved cost savings. Goal: Using the Cost Minimization analysis, achieve a system-wide reduction in cost associated with the pilot project of at least .5% (equates to approximately $5 million impact on direct medical costs)

- IT-5.2: Per episode cost of care. Goal: Evaluate the pre- and post- cost per episode of care the target population in the pilot and achieve cost saving of at least 10%

Project Description

This project will produce a tested, replicable methodology using well developed cost-accounting data for the Parkland System to evaluate resource allocations for expansions, contractions or changes of its care continuum with the objective of providing better integrated, patient-centered and cost effective care delivery.

The demand for indigent patient care services far exceeds the capacity of the Parkland system. To address this challenge in a systematic way, Parkland will implement a cost-accounting system module and establish an evidence-based methodology to evaluate and inform resource allocation decisions.

The cost accounting system will provide foundational product/process fixed/variable cost information and provide the tools to assemble episode of care and system of care cost information. This information, aligned with a cost-effectiveness methodology will provide the infrastructure necessary to position the system to make well informed decisions that consider both cost and effectiveness of care.

There has been significant discussion of the need to expand the Parkland system care continuum into the post-acute care arena. This question requires evaluation of both the cost-

effectiveness of the episode of care and to the system of care. Because this question would serve as an excellent pilot subject, this project proposed to include a test of the development with a proposed allocation of resources to the post-acute care arena.

Goals and Relationship to Regional Goals

The goals of this project are to:

1. Implement a cost-accounting module and develop a robust cost effectiveness methodology
2. Test and refine the methodology through its application to a pilot project regarding the allocation of resources to post-acute care services
3. Generalize and disseminate the methodology so that it will be used as the basis of all system-related care continuum assessments.

RHP 9 goals include improved access to care, improved care coordination and improved provider performance and outcomes. This project will provide cost savings to Parkland and to Dallas County, thus providing opportunities to provide more care to other patients in need.

Challenges

The Parkland System does not consistently utilize a standardized, best-practice methodology for evaluating the impact of investments in or changes to the care continuum. Further, the system's cost accounting technology and expertise are not sufficiently developed to provide the needed support for this type of impact analysis.

The system must commit to the design and standardized use of well-developed tools and evidence-based methodologies to assure meaningful and consistent decision making regarding system resource allocation.

5-Year Expected Outcome for Provider and Patients

The 5-year expected outcomes of this project specifically address the development and generalized to implementation of standards and best-practices that will assure better system-wide decision making and resource deployment. Through the project, Parkland believes that it will produce a lower Per Episode Cost of Care and demonstrate a better utilization of acute care resources.

Starting Point/Baseline

Parkland does not currently have robust cost accounting tools and methodologies. Baselines related to cost will be used in the measurement of project success will be developed in DY3.

Rationale

Most health care organizations confront access and throughput demands. Throughput is particularly challenging for the public health providers caring for a large population of uninsured, indigent patients for whom there are few options for health care services. Over the last several decades, the Parkland system has grown and expanded its care continuum in a somewhat fragmented way, now providing health care services in the primary care, specialty care and acute hospital care settings. Annually, the system cares for approximately 290,000 individuals - a penetration rate between 25 and 30 percent of the mandate population. Each of its care environments functions effectively at capacity – which produces access and throughput gridlock.

At this time, the Parkland system does not utilize a standardized, robust, best-practice methodology for system based decision making framing both financial and non-financial factors. Through this project, Parkland will establish the cost accounting tools to produce meaningful cost data to supply key financial factors for decision making. The cost accounting methodology and tools will support the use of two cost analysis methods:

- Cost (per episode) of Illness – comparison of costs of the design alternatives against the baseline cost per episode of care
- Cost Minimization – determining least costly alternative to produce an equivalent outcome

These factors serve as critical elements to the decision making process.

Pilot to Test and Refine Methodology

It is believed that the Parkland system should consider expansion of its care continuum to include post-acute care services potentially including some or all of the following:

- Long-term care hospital – which treats patients who stay more than twenty-five days and suffer from clinically complex problems

- Skilled nursing facility – which provides daily inpatient skilled care by nurses under a physician's plan of care

- Home with services from a home health agency – which provides skilled care to homebound patients consistent with physicians' orders and physicians' assessments. Care includes therapy, nursing care and assistance from home health aides.

As a result, many Parkland patients remain in the acute care setting consuming higher resource levels than is appropriate to their needs. For this project, it is proposed that the post-acute

development consideration serve as a meaningful and significant pilot to test and refine the cost accounting tools and methodologies.

Project Components

There are no required core components for 2.5.2 - Implement other evidence-based project to redesign for cost containment in an innovative manner not provided in other project options.

Milestones and Metrics

- P-1: Develop a cost-accounting methodology to quantify financial impact of quality/efficiency improvement interventions.
    - P-1.1: Cost-accounting methodology
- P-3: Implement the cost-accounting methodology and related systems to measure intervention impacts
    - P-3.1: Cost-accounting system
- P-2: Establish baseline for cost
    - P-2.1: Establish baseline for cost
- P-4: Conduct cost analysis
    - P-4.1: Cost analysis or results – submission of cost analysis plan or results
- P-7: Quality Improvement Milestone: Bi-weekly collaborative
    - P-7.1. Number of bi-weekly meetings, conference calls, or webinars organized
    - P-1.2: Share Challenges and solutions
- I-7: Measure cost containment by re-measuring healthcare costs of an intervention and compare to baseline to gauge improvements in cost – *using the post-acute care pilot as the basis for re-measurement.*
    - I-7.1: Ratio of Post-Intervention Care Delivery to Baseline
- P-5: Train finance staff on costing methodologies and define, develop, document methodologies with departments for allocation of costs to specific services
    - P-5.1: Staff trainings and department specific methodologies – submission of training and department documents
- I-11: Improvements in cost containment using innovative project option.
    - I-11.1: Total cost per member of the population per month
    - I-11.2: Hospital and ED utilization rates per episode cost of care

Unique Community Need Identification numbers the Project Addresses

- *CN.12 – Emergency Department Usage and Readmissions*

How the project significantly enhances an existing delivery system reform initiative

This project will establish a standardized approach and methodology for the Parkland system to inform resource allocation to produce improved cost-effectiveness both in episodic care and in the care system in total.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-5: Cost of Care

- IT-5.1: Improved Cost savings: demonstrate cost savings in care delivery
- IT-5.2: Per episode cost of care

Reasons/Rationale for selecting outcome measures

Cost savings can be demonstrated in a health care environment by assigning a monetary value to all aspects of a health care system. The monetary value depends on the direct or indirect cost of health care. Cost benefit analysis is used to summarize the cost and benefits of programs in a health care system to establish if it is effective in providing quality care delivery to the patient. The costs and benefits are usually monitored over time and need to be adjusted to the same time frame for the analysis. This type of analysis has been widely applied within the health care industry. One example is the potential savings of effectively implementing an electronic medical record (EMR) system[337] (1). The cost of a project is important to understand the risk of continuing to support a program in a health care system.

According to the Affordable Care Act (2010) the fee-for service model is changing to a pay per-performance model. The focus of reimbursement from the federal government is on the quality of the care rendered by a health care professional and not the number of services performed. The episode cost of care is a specific measure of the cost and utilization of health care. The cost is summarized for all of the health care services for a patient's medical condition within a defined period of time. This measure is vital to evaluate the entire experience of the patient in the health care system and rate the quality of care by the health professional.

Relationship to other Projects

This project is an element of the care continuum that Parkland will address through the waiver. Currently, patients stay in the hospital longer than necessary because there is no post-acute service available for them – most especially if they are indigent/Medicaid recipients.

This project relates to 127295703.2.9 (Care Transitions) and 127295703.2.7 (Patient Navigation)

Category 4 Related Outcomes

NA

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

There are no related projects being submitted in RHP 9.

Parkland plans to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcomes Learning Collaborative that is associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.2 on a scale of 9.0. Factors that influenced this score included:

- The transformational impact this project can have on the pilot post-acute continuum assessment and the institutionalized methods the Parkland system will use ongoing to assure the greatest system benefits are derived from investment of its scarce resources
- Cost avoidance by improving the effectiveness assessment methodologies used
- Better alignment of Parkland system capacity with the needs of the community it serves
- Improving the Parkland system financial and operational sustainability

This project provides a basis for evaluating the cost effectiveness of proposed changes to the care continuum with the aim to inform decision making through the objective lens of system-wide and episode of care costs impact. With annual direct medical costs of $1.07 billion, every 1% cost saving that is achieved would yield an annual value of $10.1 million.

This project provides an infrastructural redesign that will yield immediate and sustained value for the system and the population it serves. Because the Parkland system serves a direct and proportionally growing population that is between two and four times the system's physical

and financial capacity, it is imperative to put in place a comprehensive, rigorous and proven methodology to assess every potential expansion or contraction of the system's care continuum. Once designed, piloted and refined, this methodology and associated tools will provide the basis for strong economic analysis to inform decision-making and the basis for verifying post-implementation effectiveness.

Project Option 2.8.5 – Apply Process Improvement Methodology to Improve Quality/ Efficiency for Potentially Preventable Complications

Unique Project ID: 127295703.2.6

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare, and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY 2012 Volumes	Share of Dallas County Adults	
		Total	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Health Center	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention: Led by physicians, this intervention will focus on implementing prevention strategies for potentially preventable complications. All patients will be screened and those at high risk for developing sepsis or other infections will be identified using an electronic clinical decision support system, PIECES, that works in conjunction with the electronic medical record (EMR) in real time. This model will trigger alerts to decrease time to interventions (antibiotic administration) to improve patient outcomes. The intervention will also include significant training/education of medical staff, residents, students, nurses and other clinicians regarding process improvements for potentially preventable complications.

Need for the Project: In addition to improved clinical outcome for high risk patients, this project will reduce the number of preventable complications, and sepsis mortality rates

through early identification of those patients at high risk and immediate implementation of interventions.

This project is physician-led with a care team including other physicians, nurses and clinicians to that will implement a preventable complications program focusing on preventive measures.

Target Population: While all patients are included in preventive strategies around preventable complications, the target population focuses on those patients at high risk for infections. Parkland averages 35,000-38,000 admissions per year, 75% of which come through the ED. In FY2012, Parkland treated 1,131 patients with sepsis, of which 214 died. Another 350 patients were identified with central line-associated bloodstream infections (CLABSI), catheter-associated urinary tract infections (CAUTI) and surgical site infections (SSI). The goal is to reduce sepsis mortality and CLABSI, CAUTI and SSI rates for Parkland patients.

Category 1 & 2 Expected Patient Benefits: Benefits include reduced sepsis mortality and reduced risk for potentially preventable complications through early identification of high risk patients. FY2012 rates for infection and sepsis mortality are as follows:

- CLABSI: 2.5 per 1,000 catheter days
- CAUTI: 5.1 per 1,000 catheter days
- SSI: 3.1% (49/1,565 cases)
- Sepsis Mortality: 19%

Category 3 Outcomes: The outcomes/goals for this project include:

OD-4: Potentially Preventable Complications and Acquired Conditions

- IT- 4.2: Central line-associated bloodstream Infection (CLABSI). Goal is 25% annual decrease in DY3, DY4, DY5 for Hospital-Onset CLABSI cases
- IT-4.3: Catheter-associated Urinary Tract Infection (CAUTI). Goal is 25% annual decrease in DY3, DY4, DY5 for Hospital-Onset CAUTI cases
- IT-4.4: Surgical Site Infections (SSI). Goal is 10% annual decrease per year - D3, DY4, DY5
- IT-4.8: Sepsis Mortality. Goal is to decrease sepsis rate by 5% annually in DY3, DY4, DY5

Project Description

Parkland Health & Hospital System physician leadership will implement evidence-based interventions – prevention strategies – that will improve the rates of potentially preventable complications such as CLABSI, CAUTI, SSI and Sepsis Mortality.

Physicians at Parkland are collaborating to develop protocol-driven approaches to reduce risk of potentially preventable complications. Physicians are beginning to develop comprehensive screening tools for early detection, implementing rapid response/code sepsis procedures and

educating staff about protocols for sepsis and other complications. Physicians in the ED and ICU are coming together in this effort to improve communication and discuss process gaps that may lead to increased rates of infections and complications for patients and to discuss interventions to insure patients will not be readmitted once discharged. It has been well documented that improving communication between the ED and the ICU providers is integral to improving outcomes for patients with risk of infections.[338] For this process improvement project to be successful, access to real time data for the identification of patients who are at risk or who may be in the early stages of sepsis or at risk for having other complications is essential. Physicians have submitted a 5-year plan with prevention strategies to meet annual reductions in preventable CLABSI, CAUTI, SSI rates and sepsis mortality.

Goals and Relationship to Regional Goals

Parkland's goals for the project include providing earlier detection and improved quality of care for patients with sepsis/infections/other complications with the stated outcome of a reduction in potentially preventable complication rates - CLABSI, CAUTI, SSI and Sepsis. And once patients are treated and discharged, it is anticipated that unnecessary readmissions will be avoided.

Regional goals include improved provider performance and outcomes based on the Community Needs Assessment, where patient safety and quality were identified priorities.

Challenges

A quality improvement project to reduce complication rates poses some challenges to Parkland. Providers need access to real time data highlighting patients who may be at risk and those displaying early symptoms. There must be increased communication between physicians and at all sites of inpatient care including the ED and ICU and there must be more training/education regarding maintenance of catheters, hand hygiene, etc. for providers an increased education for patients being discharged with central venous catheters in care/maintenance. These challenges are being addressed through care teams who are committed to improving preventable complication rates.

5-Year Expected Outcome for Provider and Patients

The five year goal for the project is a reduction in complication rates (CLABSI, CAUTI, SSI) and sepsis mortality as a result of implementing early detection and prevention strategies and process improvement initiatives. This will not improve patient outcomes and reduce lengths of stay for those patients, providing bed access to other patients.

<u>Startimg Point/Baseline</u>

[338] STOP Sepsis Collaborative

In FY2012 at Parkland 1,131 patients were treated for sepsis of which 214 died. Additionally, more than 350 patients had CLABSI, CAUTI or SSI. The the incidence for Hospital-Onset infections in the ICU was as follows:

- CLABSI: 2.5 per 1,000 catheter days
- CAUTI: 5.1 per 1,000 catheter days
- SSI: 3.1% (49/1,565 cases)
- Sepsis Mortality: 19%

Rationale

Hospital acquired infections are a costly component of health care and in many cases are preventable. Urinary tract infections are the most common type of healthcare-associated infections and account for 30% of reported hospital-associated infections. Virtually all healthcare-associated urinary-tract infections (UTIs) are caused by insertion of catheters and as such CAUTI has been associated with increased morbidity, mortality, hospital cost, and length of stay, all of which lead to increased and redundant use of resources and increased costs.[339] Central line-Associated Bloodstream Infections (CLABSI) cause increased morbidity as well as mortality rates between 12% and 25%. Additional required resources and extended lengths of stay increase the costs of such preventable complications. Estimated costs per CLABS infection are approximately $25,000. [340] Surgical site infections (SSIs) are the most common type of nosocomial infections and lead to revision surgeries, delayed healing, increased use of medicine/antibiotics, and increased lengths of stay.[341]

Mortality rates from severe sepsis are on a similar scale to lung, breast, and colon cancer, and it is one of the leading causes of death in the intensive care unit as well as the tenth leading cause of death in the United States. Due to its aggressive, multifactorial nature, sepsis is a rapid killer. Death is common among sepsis patients, with around 30% of patients dying within the first month of diagnosis and 50% dying within 6 months (4-6). The 28-day mortality rate in sepsis patients is comparable to the 1960s hospital mortality rate for AMI patients.

Moreover, the number of severe sepsis cases is set to grow at a rate of 1.5% per year, adding an additional 1 million cases per year in the USA alone by 2020. This will increase total mortality and increase the burden on health care resources. The increase is mainly due to the growing use of invasive procedures and increasing numbers of elderly and high-risk individuals, such as cancer and HIV patients. Older people are at an increased risk of sepsis as they are more

[339] Centers for Disease Control. http://www.cdc.gov/hicpac/CAUTI_fastFacts.html. 2012.

vulnerable to infections due to aging, co-morbidities, use of invasive surgical techniques, and problems associated with institutionalization. [342]

According to the STOP Sepsis campaign, sepsis costs hospitals across the nation $16.7 billion annually. It can result in increased hospital stays as well as increases in utilization in the ED and ICUs, the most expensive sites to deliver care. There is evidence that the costs associated with sepsis patients in an ICU are six times higher than ICU patients without sepsis[343].

Based on the recent report by the Texas Health and Human Services Commission "Potentially Preventable Complications in the Texas Medicaid Population," there were more than 21,000 potentially preventable complications (PPC) in Texas hospitals in State Fiscal Year 2011 at an estimated hospital cost of $88.7 million.[344] In attempts to address these potentially preventable complications, hospitals and physicians are implementing interventions to identify patients at risk for acquiring infections and to detect early signs of infections in order to treat quickly and effectively.

Project Components

There are no required core components for this Project Option.

Milestones and Metrics

- P-1: Target specific workflows, processes and/or clinical areas to improve
    - P-1.1: Performing provider review and prioritization of areas or processes to improve upon
- P-6: Implement program to improve efficiencies and/or reduce program variation
    - P-6.1: PI Events
- P-8: Train providers/ staff in process improvement
    - P-8.1: Number trained
- P-13: Participate in at least biweekly interactions (meetings, calls, webinars) with other providers and RHP to promote collaborative learning around shared or similar ideas
    - P-13.1: Number of biweekly meetings, calls, webinars organized by RHP that provider participated in
- P-X: Engage clinicians, non-clinicians and other stakeholders in developing interventions
    - P-X.1: Engage stakeholders, identify resources, potential partnerships, develop intervention plan (implementation, evaluation, sustainability)
- I-16: Improve quality and efficiency using innovative project option

How the Project significantly enhances an existing delivery system reform initiative

The focus of this quality improvement project is the improvement of quality of care for patients at risk for complications/infections through implementation of planned interventions developed by physicians at Parkland.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-4: Potentially Preventable Complications and Healthcare Acquired Conditions

- IT-4.2: Central line-associated bloodstream infections (CLABSI) (Standalone Measure)
- IT-4.3: Catheter-associated Urinary Tract Infections (CAUTI) (Standalone Measure)
- IT-4.4: Surgical Site Infections (SSI) (Standalone Measure)
- IT-4.8: Sepsis Mortality (Standalone Measure)

Infections cause delayed healing, increased pain and discomfort for patients, and additional days in the hospital, potential readmissions and increased morbidity and mortality. Best practice and evidence-based protocols contribute to the reduction of the number of infections, improving patient outcomes, and increasing hospital capacity for other patients. We are implementing an evidence-based program for early identification of patients at high risk for infections. Earlier identification will trigger alerts to begin certain interventions that will reduce the risk of acquiring infections or sepsis. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through the physician care teams.

Relationship to Other Projects

This project's milestone metrics and clinical outcomes will be leveraged with work being done in Project 127295703.1.4 - Enhance Performance Improvement and Reporting Capacity.

Category 4 Related Outcomes

- RD-3: Potentially Preventable Complications

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

While no other projects have been submitted specific to CLABSI, CAUTI and SSI, several projects have been submitted for sepsis management and include the following:

Performing Provider	Unique Project
Denton Regional Medical Center (HCA)	111905902.2.1
Medical City of Dallas Hospital (HCA)	020943901.2.2
Medical Center of Lewisville (HCA)	094192402.2.2

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcomes Learning Collaborative that is associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.7 on a 9.0 scale. Influencing factors included:

- By implementing process improvement methodologies and evidence-based interventions, complications such as CLABSI, CAUTI and SSI can be significantly reduced
- By implementing interventions to reduce infection rates, costs will be avoided/reduced
- Sustainable improvement of clinical outcomes for patients

When considering institutional cost avoidance, excess utilization of scarce resources such as ICU and inpatient beds, and the value of lives saved through the reduction of the number of CLABSI, CAUTI and SSI cases, the value to the health care system and community is enormous. Considering a Value of Statistical Life of $7.9 million[345], the table below presents the impact this project is intended to have on sepsis mortality alone:

Waiver Year	Mortality Rate	Actual Cases of Mortality	Proforma Cases of Mortality	Proforma Reduction in Cases of Mortality	Proforma Estimate of Value
Baseline	14.4%	116			
DY4	13.7%		110	6	$47,400,000
DY5	13.0%		105	9	71,100,000
					$118,500,000

The pro forma value of $118.5 million compares favorably with the proposed total Categories 2 and 3 value of $39,192,393.

Project Option 2.9.1 – Enhance Patient Navigation

Unique Project Identifier: 127295703.2.7

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY 2012 Volumes	Share of Dallas County Adults	
		Total	Medicaid/Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Health Center	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention:

Develop and implement a new patient navigation program to provide support and assistance with connections to care for Parkland patients with mental health disorders that present in the emergency department or at community health clinics. Unlike the more clinically-oriented nurse navigators supporting other Parkland medical, surgical and chronic disease patient cohorts, the competencies for this navigator role will emphasize cultural and language competence and focus more on connecting patients to resources and support systems, addressing health and social barriers, facilitating communication, streamlining appointments and paperwork, implementing outreach strategies and supporting patient activation and self-management.

Need for the Project:

People with serious mental illness suffer excess mortality and die on average 25 years earlier, compared to the general population. An estimated 60% of those with serious mental illness die from preventable diseases. There is an increasing need for resources that can support this patient population and assist with their connections to medical and mental health care.

Annually, an approximate 14,000 unique individuals have approximately 30,000 encounters in the Parkland system with a primary diagnosis of mental disorder. The use of this criteria provides a conservative view of the Parkland patient population with mental illness, but provides context as a basis for evaluation.

This described patient set accounts for approximately 100,000 Parkland encounters with any primary diagnosis. Of this patient set, within a year, 5 patients had more than 40 ED encounters, 25 had between 20 and 40 ED encounters, 100 had between 10 and 20 ED encounters and 250 had more than 5 ED encounters. Of this patient set, approximately 45% had a payer status of Self Pay or Charity, 30% were Medicaid and approximately 20% were Medicare.

Improved care navigation support and assistance to this sizable and vulnerable population would yield improved use of health care resources and better health status outcomes for the individuals. Further, because mental health resources are in particularly high demand, focused patient navigation support is necessary to assure appropriate care coordination occurs and individual needs are prioritized and met.

Target Population: The patients targeted for this intervention will include patients with a mental disorder primary diagnoses with an encounter primarily in the Parkland emergency department (potentially post-discharge if admitted from the ED), provider referrals from the community and campus-based primary care providers for patients with primary or co-occurring mental disorder diagnoses who are determined to require or could substantially benefit from navigation support, and referrals through Parkland system case managers and discharge planners. This intervention will target Medicaid and indigent patients.

Category 1 & 2 Expected Patient Benefits: Benefits include improved patient outcomes including decreased unnecessary ED visits/readmissions, increased access to needed care, and enhanced self-management skills as well as increased patient and family satisfaction.

Category 3 Outcomes: The FY16 goals include the following improved outcomes:

- IT.3.1: All Cause 30-day Readmission Rate
    - Goal: Decrease readmissions rate from 8.74% (2,770/31,683) to 8.5%

Project Description

Parkland will develop and implement a new patient navigation program to provide support and assistance with connections to care for Parkland patients with mental health disorders that present in the emergency department or at community health clinics.

This intervention will extend the existing Care Management program by designing and implementing a new Patient Navigation program to provide support to patients with serious mental illness who present in Parkland's emergency department and community health centers. The project will consist of three phases: program design and development, program pilot and implementation, post-implementation assessment.

Program Design and Development

Three nurse navigation programs currently exist at Parkland supporting patients in oncology, trauma and surgical services. While these programs support connecting patients to appropriate clinical resources, they are clinically focused to assist patients with complex medical needs within the Parkland system. As conceived, this new navigation program will be less clinically oriented and focus more on a range of navigation needs specific to this targeted patient population, connecting resources within and outside the Parkland system.

Because the target population for this program may require access to both behavioral health and medical resources, may require connection to services inside and outside the Parkland system, may confront multiple financial eligibility determinations, and may have more direct need for cultural and language competency, this new navigation program will require a dedicated focus and differentiated design.

The first step in the program design will be a needs assessment and demand analysis that will assess the number and the clinical and demographic characteristics of the target emergency department and community health center target populations. Eligibility criteria will be established and will consider age (age 18 or older), mental illness diagnosed disorder, medical condition(s), presence or absence of a regular primary care provider. It is anticipated that patients actively suicidal or homicidal will not be eligible. Patients who have been admitted to the hospital for stabilization will be screened for eligibility once stabilized and ready for discharge. With a refined understanding of the patient population size and characteristics, the eligibility thresholds will be determined for the pilot phase of the implementation.

On the basis of the initial program design, the role, characteristics and competencies of the patient navigator will be shaped. At this time, it is believed that the navigator competencies will weigh heavily toward cultural and language competency, conversancy with the internal and external health and community resources and financial eligibility systems – favoring a health care worker profile. A navigator workload will be estimated for testing through the pilot phase.

Program Pilot and Implementation

On completion of the initial program design, eligibility criteria and navigator role determination, one or two pilot sites will be selected and a pilot program will be instituted and continued for a period of six weeks to six months. During the pilot, the program design, patient eligibility criteria and staffing model will be tested and refined. It is anticipated that during the pilot phase, approximately 200 patients will be enrolled - 50 patients through referral from the primary care setting, 50 patients referred by Case Management and 100 patients enrolled through the emergency department.

Based on the learnings from the pilot, the implementation design will be finalized and an implementation plan prepared to include: sites of care, space requirements, staffing, policies and procedures, health record calibration, training and orientation programs for program staff, internal resource staff and external resources, agencies and community partners and a post-implementation assessment design. Upon full implementation, it is anticipated that the program will serve approximately 3,500 unique individuals annually.

The program will be operationalized in accordance with the implementation plan. Throughout late pilot and implementation phases, the program team will participate in regional and statewide learning collaboratives, face-to-face learning and other performance improvement initiatives.

Post Implementation Assessment

A post implementation assessment will be a component of the implementation plan and will be conducted as indicated in the plan. The functional activities of the Care Transitions program will make use of system-wide performance improvement methods and practices.

Goals and Relationship to Regional Goals

The patient navigator program will insure patients with mental disorders are directed to the appropriate care setting within or outside the health system. With teams interacting with patients, identifying gaps and barriers to services, insuring good communication and planning for the next steps in the patient's care, the percentage of high utilizers of ED services and readmissions should decline.

Regional goals include improved access to care, improved care coordination and improved provider performance and outcomes. A best-practice care coordination program at Parkland supports all goals by improving access to appropriate care settings and coordinating care for the patient across the care continuum. Patient navigators are instrumental in assisting patients and insuring care is managed appropriately in the appropriate care settings.

Challenges

As a new initiative, it will be imperative to establish and use clear protocols to identify and enroll targeted patients in the Navigation program. It will also be necessary to establish clear interfaces between this program and base Care Management and associated programs so as to best invest and direct the resources of the Navigation Program. Again as a new initiative, focused attention must be paid during implementation to measure and modify, as appropriate, the intervention design to assure that the desired outcomes are achieved.

5-Year Expected Outcome for Provider and Patients[346]

The patient navigator program is intended to enhance efficiency and patient flow/throughput and also establish closer linkages between hospital respective community organizations and services. Specifically for patients, the 5-year expected outcome will be a decrease in the number of All Cause and Diabetes 30-day Readmission Rates and a decrease in the number of patients targeted by this intervention with ED visits within 30 days of discharge.

Starting Point/Baseline

A conservative estimate of the population pool for this initiative is approximately 14,000 unique patients. Because this will be a new navigation program, no patients are currently enrolled.

Rationale

Care coordination programs, and specifically patient navigation programs, have been proven to improve providers' ability to track, manage, and support patient care, while simultaneously improving provider/patient communication and trust among disadvantaged populations.[347] Such programs have emerged as a means of coordinating fragmented care, identifying gaps in care, and facilitating patient access to appropriate follow-up care settings.

Specific to Parkland's patient navigation program, the goal is to improve access to care for patients with mental disorders who are discharged from the hospital and/or ED or referred by primary care providers and care management professionals. The program will educate patients on accessing and utilizing health care services and will empower patients with knowledge they need in their next steps of treatment. Patient navigators work with patients and provide patients with confidence about their treatment plan which will likely improve patients' compliance rate with follow up.

Enhanced utilization of patient navigation services is intended to prevent readmissions and decrease unnecessary ED visits. ED use for non-emergency care and repeat use for unresolved conditions is not desirable for the hospital or the patient. Episodic ED care lacks the benefits from the continuity of care and is costly to provide in the acute resource setting of the hospital

[346] Clinical Intelligence. "Leveraging Parkland's Interdisciplinary Care Coordination Teams Across the Healthcare Continuum-Care Coordination Redesign." September 5, 2012.

[347] Dohan D. & Schrag D. Using Navigators to Improve Care of Underserved Patients: Current Practices and Approaches. *American Cancer Society*. 2005. Pp. 848-855. Published online 11 July 2005 in Wiley InterScience.

ED. Nevertheless, hospitals continue to struggle with providing care to increasing numbers of vulnerable adults who use them as their primary source of health care.

Project Components

The required core components of this project - 2.9.1 are as follows:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency. *The needs assessment and demand analysis will support the development of eligibility requirements and highlight the particular needs for cultural competency training*.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators*. As the program design is developed, the specific role and skill set of the navigators will be determined*.
c) Connect patients to primary and preventive care. *The project design supports connections to primary care and to appropriate community support services and resources*.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management. *Goals of the care coordination program redesign is to insure patients can identify their navigator, participate in care decisions, have coordinated community support and are satisfied with access and care coordination.*[348]
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *A variety of methods and techniques will be used throughout project design, piloting, implementation and post-implementation to maximize the effectiveness of this intervention.*

Project Milestones and Metrics

- P-1: Conduct needs assessment to identify targeted patient population
    - P-1.1: Report identifying patient population at high risk of readmissions:

[348] Clinical Intelligence. "Leveraging Parkland's Interdisciplinary Care Coordination Teams Across the Healthcare Continuum-Care Coordination Redesign." September 5, 2012.

- P-2: Expand health care navigation program to provide support to patient populations who are most at risk of receiving disconnected/fragmented care including training programs, procedures, continuing education
    - P-2.1: Number of people trained as patient navigators, number of navigation procedures, number of CE sessions for navigators
    - P-2.2: Number of unique patients enrolled in program
- P-8: Participate in face-to-face learning at least twice per year with other providers and RHP to promote collaborative learning around shared or similar projects
    - P-8.1: Participate in semi-annual face-to-face meetings or seminars
    - P-8.2: Implement "raise the floor" improvement initiatives from meetings
- I-8: Reduction in ED use by identified ED frequent users receiving navigation services
    - I-8.1: ED visits pre- & post- navigation services by individuals ED frequent users

Unique Community Need Identification Numbers the Project Addresses

- Lack of access to primary care (CN.4), behavioral care (CN.5), and specialty care (CN.8)
- Emergency Department utilization and Readmissions (CN.12)

Related Category 3 Outcome Measure(s)

OD-3: Potentially Preventable Admissions

- IT.3.1: All Cause 30-day Readmission Rate (Stand-alone Measure)

Communication barriers can influence the risk of admissions and readmissions for patients with mental health issues. Patients in the ED and/or hospital need to understand their discharge instructions for recovery or for transfer to another facility. Patients with mental health issues require additional attention – they may not understand instructions or it may not be well communicated. Better communication can assist in preventing a mental health care issue from becoming more serious and requiring hospitalization. In particular, the degree to which staff members communicate with patients about their discharge needs can directly impact the risk of readmission for patients. Patient navigators can provide the extra attention necessary and offer assistance in transferring patients to other settings where they can receive appropriate care. Readmissions will provide a measure to inform whether the communication and navigation assistance is successful for these patients.

Relationship to Other Projects

As key components of the care coordination redesign, patient navigation and care transitions are interrelated. Other projects are interrelated since they are components of the care delivery system that will support patient navigation and care transitions. Those projects are as follows:

Unique Project	Option	Project Description
127295703.1.1	1.1.2	Expand existing primary care capacity – Grand Prairie

127295703.1.2	1.1.2	Expand existing primary care capacity
127295703.1.6	1.1.1	Establish more primary care clinics – Acute Response Clinic
127295703.2.1	2.1.1	Expand/enhance medical home model
127295703.2.10	2.1.1	Expand/enhance medical home model – Family Medicine
127295703.2.5	2.5.2	Assess cost effectiveness of post-acute care alternatives
127295703.2.9	2.12.1	Implement care transitions program

Category 4 Related Outcomes

- RD-2: Potentially Preventable Readmissions for All Cause and Diabetes
- RD-5: Emergency Department

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Related projects (Project Option 2.9) that performing providers are submitting include:

It is anticipated that this project will dovetail specifically with the Dallas County project 121758005.1.1 – Development of Behavioral Health Crisis Stabilization Services as Alternatives to Hospitalization. This project is designed to provide new behavioral health services and targets, in part, patients from Parkland's emergency department and community health centers.

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcomes Learning Collaborative that is associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 6.20 on a 9.0 scale. Influencing factors included:

- The strong impact this will have with respect to managing, at the health system level, patients among Parkland's vulnerable population at highest risk for complex/ costly care
- Cost avoidance by providing streamlining and enabling program patients to obtain the right care in the right place at the right time
- Patients with behavioral health disorders are among the region's most vulnerable patient population. Access to behavioral health resources is challenging; without intervention, the emergency department and criminal justice system become the most accessible and most costly alternatives.

In the two post-implementation years of the plan, this project will impact the lives of 6,000 individuals, assisting them to access the resources they require for their physical and mental health. This will promote greater economic productivity as well as reducing the costs of medical and behavioral care.

There are opportunities for partnership and collaboration with the many performing providers in RHP 9 that are pursuing patient navigation projects

Project Option 2.10.1 – Use of Palliative Care Programs

RHP Project Identifier: 127295703.2.8

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention: Parkland has a small inpatient consult palliative care service. This intervention will establish a comprehensive palliative care program including an enhanced outpatient clinic program and a dedicated inpatient unit. Currently approximately 40 inpatients are identified each day who require palliative care services and without a dedicated unit, the patients are spread throughout the hospital on the medical and surgical units. The comprehensive and dedicated palliative program will assure these patients are cared for in a comfortable environment by specially trained medical staff, nurses, social workers and care managers.

Need for the Project: In FY2012, there were 1,174 inpatients at Parkland identified as having a palliative care encounter (ICD-9-CM code V66.7 "Encounter for Palliative Care") while more than 7,000 patients were identified as potentially needing palliative care services. Currently and at any given time in the oncology program, there are 75 patients (80% indigent/Medicaid) waiting for palliative care consult services.

Of those who had Palliative care consults in FY2012, 150 had 1+ ED visits within 30 days of their death. While that number is relatively low in comparison to the total number of discharges, it is 12.7% of patients who did have palliative services. With expanded capacity of the Palliative program, the number of patients who utilize the ED could potentially rise without interventions in place to assure that does not happen.

Target Population: In FY2012, 1,174 inpatients at Parkland received palliative care consults and 210 died at Parkland, while more than 7,000 were identified as potentially requiring palliative care services. The target population includes all patients with life-limiting illnesses and their family/caregivers and of those, the goal is to insure they are discharged to an appropriate setting and do not have unnecessary medical services in the last days of their lives.

Category 1 & 2 Expected Patient Benefits: Expected benefits for palliative patients include improved satisfaction with their care. As inpatients, they would be within a dedicated palliative unit where staff members and patients around them share their fears/concerns and can provide support. And, as appropriate, they can be sent home or to other settings earlier where they and their families may be more comfortable. Outpatient services can be set up and tailored to their needs as well.

With care centered on each patient, providers and their care team of nurses and other clinicians and non-clinical team members (pastors, etc.), patients will be less likely to have unnecessary medical services near the end of their life. This will reduce their fear/anxiety as well as that of their families. Pain management and other compassionate type services can be provided and patients can focus on other end-of-life concerns.

Organizations may see a reduction in utilization high cost services at the end of life and also reduced length of stay for patients who are palliative scattered across the hospital which translates to lowered costs if patients are placed in a dedicated unit and discharged quicker to a more appropriate setting.

Category 3 Outcomes: Although there are other appropriate outcomes including improved patient and family experience for this trying time, the improved measurable outcome selected for this project includes:

OD-13: Palliative Care

- IT-13.3: Proportion of patients with more than one ER visit in the last days of life

- Goal: With increased palliative care capacity/volumes, the goal is to decrease the percentage of patients with more than 1 ER visit in the last days of life by 50%

Project Description

Parkland will implement a palliative care program based on an interdisciplinary palliative care model. A business plan will address inpatient and outpatient needs for palliative care for patients at Parkland and will follow an evidence-based care model as supported by the Center to Advance Palliative Care (CAPC) to insure implementation of a comprehensive program.

According to the Center to Advance Palliative Care (CAPC), palliative care programs "link diverse hospital departments and services for effective and efficient use of hospital resources. This approach results in higher quality, well-planned treatment that anticipates future care needs."

Currently Parkland inpatients who require palliative care are scattered throughout the medical/ surgical and ICU units within Parkland Hospital. Care is provided by many with good intent but with little or no experience/ education/ training regarding care for palliative patients. Faculty members provide palliative care through consult services in the hospital and feel that care could be provided more effectively in an identified inpatient unit. Additionally, there are not enough providers for the outpatient care needs as well for palliative patients.

Parkland will address the feasibility of implementing a palliative care program to address end-of-life decisions and care needs that patients may have. Specifically, this project will enable development of a business plan for palliative care including the planning activities necessary as precursor to implementing the program. Once the business plan is developed Parkland will transition palliative care patients from acute hospital care into a more appropriate setting such as home care, hospice or a skilled nursing facility. The plan for palliative care will address inpatient but also the outpatient setting to insure as capacity is expanded by establishing a palliative care unit, the balance for outpatient care capacity is also addressed.

Goals and Relationship to Regional Goals:

The goal of this project is to insure that patients who are eligible for palliative care services receive the best and most appropriate care in the most appropriate setting possible. Specifically, this project will direct planning, implementation and monitoring of improvements to ensure that palliative care for terminal patients occurs in a manner that prioritizes pain control, social and spiritual care, and patient/family preferences. Project objectives include:

- Develop a business plan for palliative care which will determine the total need for services as well as space and staffing needs for palliative care and associated cost
- Establish a dedicated unit for palliative care patients
- Increase the number of palliative care consults

- Implement palliative care education and training programs for providers that incorporate management of non-cancer patients

Providing palliative care in an appropriate setting such as a palliative or hospice unit frees up much needed capacity in other units to accommodate patients who may be in the ER waiting for a bed. Not only does the unit provide a dignified and comfortable environment for patients with very specific end-of-life needs, it provides opportunity for the hospital to provide care to other patients who may have otherwise not had access. The new bed capacity allows more access and thus meets regional goals of increasing capacity to services.

Regional goals include improved access to care, improved care coordination and management and improved provider performance and outcomes. Providing palliative care in a focused manner provides access to better care and also allows improved care management for this population and their families.

Challenges

Palliative care is a medical model arising from the prolonged life issues resulting from medical technology advances. It focuses on quality of life rather than curing disease or prolonging life in terminal situations. As such, there is growing acknowledgment that the end-of-life experience is an important factor in treatment and health care decisions. This involves teaching, counseling, coordinating, monitoring, and assisting patients to gain access to needed care, medications, and services.

Because of the breadth of palliative care needs, a variety of professionals and services are required for full availability to patients. Further, the relative newness of palliative care as a medical specialty limits the number of medical professionals available to provide that care. Thus, the biggest challenge to this project will be arraying and facilitating collaboration among the variety of professionals and service providers needed to effectively coordinate palliative care services. Parkland will address this challenge through targeted staff recruitment and training programs as appropriate. Establishing a dedicated inpatient unit, while a challenge, can be addressed as the new hospital is being designed and will open in 2015.

5-Year Expected Outcome for Provider and Patients

The outcome is implementation of a palliative care program that will not only increase the volume of patients cared for through a palliative care model but will reduce the percentage of patients who utilize services such as ICU and ED care in the last days of life

The care plan for a patient under palliative care typically discontinues many high cost tests and invasive treatments and focuses on symptom management and quality of life. As a result,

another outcome will be decreased lengths of stay and costs for patients who receive palliative care services in-house.

Starting Point/Baseline

In FY2012, 911 patients were identified as having palliative care consults. And, of the 210 palliative patients who expired at Parkland, 150 of those patients had an ED visit within 30 days of their death at Parkland.

Rationale

Palliative care programs can improve the quality of life for many patients suffering from chronic and/or terminal conditions[349]. By reducing the amount of invasive testing and treatment and focusing on pain management and quality of life Parkland may also realize cost savings[350]. In a study based on 2004-2007 data in New York, it was determined that patients who received palliative care incurred $6,900 less in hospital costs during a given admission when matched to hospital patients of usual care.[351] Beyond reducing unnecessary service utilization, palliative care has the potential to improve health care quality by encouraging more appropriate and compassionate end-of-life care.[1]

End-of-life care is no longer associated almost exclusively with terminal cancer, but is now used for a variety of other conditions: congestive heart failure, circulatory conditions, COPD, dementia, and congestive heart failure[352]. Some have suggested that palliative and hospice care could be more widely accepted for many dying patients, including children. However, conversely, rigid quality standards and poorly aligned reimbursement incentives frequently discourage appropriate end-of-life care, while incentivizing restorative and technologically intensive treatments. Care coordination near the end of life can improve care for patients with chronic conditions, relieve suffering, and can be used in addition to curative treatment.

Project Components

Required core components of Project Option 2.10 - Use of Palliative Care Programs include:

a) Develop a business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program. *Preliminary discussions have occurred and a team to develop a business case is being identified – a clinical champion has been identified.*

[349] "Integrating Palliative Care into Oncology Practice", Oncology Roundtable, The Advisory Board Company, 2011.
[350] Cost savings associated with US hospital palliative care consultation programs. Morrison RS, Penrod JD, Cassel JB, Caust-Ellenbogen M, Litke A, Sprangens L, Meier DE; Palliative Care Leadership Centers' Outcomes Group. Arch Intern Med. 2008 Sep 8; 168(16):1783-90.
[351] Morrison,R, et al. "Palliative Care Consultation Teams Cut Hospital Costs for Medicaid Beneficiaries." Health Affairs. Mar 2011
[352] MedPAC, 2008

b) Transition palliative care patients from acute hospital care into home care, hospice or a skilled nursing facility. *The implementation plan based on the business plan will include protocols for transitional care for these patients.*
c) Implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care and improve scores over time. *This will be done in DY5.*
d) Conduct quality improvement for project using methods such as rapid cycle improvement. Parkland will participate in regional collaboratives to share best practices and analyze quality data on a weekly basis. *This will be done through face-to-face meetings/seminars semi-annually as well as improved communications internally with care coordination teams and other providers.*

Milestones and Metrics

- P-1: Develop hospital-specific business case for palliative care and conduct planning activities necessary as precursor to implementing program
    - P-1.1: Business Case
- P-8: Document conditions for which palliative care is consulted
    - P-8.1: Breadth of conditions for which palliative care is consulted
- P-3: Implement palliative care education and training programs for providers that incorporate management of non-cancer patients
    - P-3.1: Palliative care training and education for providers documentation
- P-11: Participate in face-to-face learning at least twice per year with other providers and RHP to promote collaborative learning around shared or similar projects
    - P-11.1: Participate in semi-annual face-to-face meetings or seminars
    - P-11.2: Implement "raise the floor" improvement initiatives established
- P-6: Increase number of palliative care consults
    - P-6.1: Palliative care consults meet targets established by program
- I-10: Among patients who died in hospital, increase proportion of who received a palliative care consult
    - I-10.1: Percent of total in-hospital deaths who had palliative care
- I-12: Implement patient/family experience survey regarding quality of care, pain and symptom management and degree of patient/family centeredness and improve scores
    - I-12.1: Survey developed and implemented and results provided

Unique Community Need Identification Numbers the Project Addresses:

- *CN.13 – Need for Palliative Care Services*

How the Project represents a new initiative

This project is a new initiative for Parkland in that the designed program will be comprehensive and implement an integrated care model through inpatient and outpatient care. A specific inpatient unit would be designated for patients with palliative needs. It has been recently estimated that approximately 20-30 inpatients on any given day are in need of palliative services and are scattered throughout the hospital. This project will provide the opportunity to cohort this group of patients with similar needs – allowing providers and care givers to improve efficiencies and focus on quality of care/life needs for these patients.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measures

OD-13: Palliative Care

- IT-13.3 - Reduce % patients with more than one ED visit in the last days of life

Reasons/Rationale for Selecting Outcome Measure

The category 3 outcome above is established by the National Quality Forum (NQF). This non-profit organization's mission is to improve the quality of American healthcare. Those in the American healthcare system are getting older and are in need of more health care services. The ED is not an ideal setting for care for the elderly because of the intense environment. In the ED and ICU the staff members are trained to diagnose problems quickly and save lives. According to the Health and Retirement Study over half (51%) of older patients arrived in the ED in their final month of life. Three quarters of those that went to the ED were admitted to the hospital with 39% of them going to the ICU. A large percentage of the patients (68%) died that were admitted in the hospital. The ED or ICU is not the best environment for palliative care. By implementing this program, visits to the ED and hospital ICU in the last days of life decreases.

Relationship to Other Projects

Proposed projects that relate to establishing a palliative care program include the following:

Unique Project	Option	Project Description
127295703.2.5	2.5.2	Assess cost effectiveness of post-acute care alternatives
127295703.2.7	2.9.1	Enhance patient navigation program
127295703.2.9	2.12.1	Implement care transitions program

Category 4 Related Outcomes

- RD-5: Emergency Department

Relationship to Other Performing Providers' Projects

The only related project (Project Option 2.10) is being submitted by UT Southwestern – University Hospital (175287501.2.2).

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcomes Learning Collaborative that is associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 6.85 on a 9.0 scale. Factors that influenced this score included:

- Although this project is targeted to address the needs of a smaller patient population, the impact of this project will be profound – enabling patients to obtain compassionate care in a setting tailored to preserve their dignity
- Cost avoidance by providing the right care setting and resources to meet the patients' needs while freeing costly and scarce critical care capacity for patients requiring that higher level of care
- Fulfilling the community need for palliative care services and capacity
- Furthering the operational and financial sustainability of the health system through more cost effective care

Palliative care has been demonstrated to improve quality of life and reduce hospital costs through reduced lengths of stay, medical complications, and overuse of unnecessary, ineffective/marginally effective services; and through transitioning patients to safe hospital discharges with lower likelihood of readmission. Through a comprehensive palliative care program, Parkland will cohort inpatients for more effective and efficient care – driving cost savings – and importantly, preserve scarce intensive care and acute care bed resources to better meet the needs of the patient population.

The value of this program goes beyond the reduction of cost. By expanding palliative care, vulnerable patients who often lack social, financial and supportive resources, will have the accessibility of supportive care at the time it is most needed.

Intervention: Transitional Care programs focus on patients transferring from one care setting to another. Typically, the medically complex patients are selected for care transition intervention. However, based on predictive modeling research performed in the Parkland Center for Clinical Innovation[353], incorporating complex social factors increased the model's

[353] Med Care. 2010 Nov; 48(11):981-8; An automated model to identify health failure patients at risk for 30-day readmission or death using electronic medical record data; Amarasingham R; Moore, BJ; Tabak, YP, et.al.

accuracy, suggesting that such factors could enhance risk adjustment models designed to compare hospital readmission rates.

This project proposes to design, develop and implement a care transitions program modeled largely around "The Care Transitions Program" design of Eric A. Coleman, MD MPH targeting patients being discharged from an inpatient status with higher social complexity and lower medical complexity. Through a case finding protocol, the existing Discharge Planning function, will identify and refer patients to Transition Coaches who will provide support and guidance in accordance with the program design. This aim of this program will be to offer primary care and prevention, improve health literacy and patient activation, facilitate connections to address social problems thereby reducing readmissions, inappropriate ED use and promoting primary prevention.

Need for the Project: Parkland, as the primary safety net hospital for Dallas County, often functions at capacity in all sites in its continuum of care. Patient demand far outstrips the physical and financial capacity of the system. Accordingly, it is imperative that the system resources are used in the most efficient and effective manner possible – duplication, overuse and waste must be eliminated.

Readmission after hospitalization is costly and consumes both time and valuable resources. Further, both hospitalization and emergency department recidivism deprive the patient of the opportunity to establish or resume stability and effect optimal quality of life. This project will intervene with the most vulnerable patients to identify and overcome barriers to stability, facilitate timely access to appropriate sites of care, and assist the patients and their caregivers to achieve health literacy and self-management which will result in reduced readmissions and emergency department recidivism.

In the national debate regarding the rising cost of health care, prevention is seen as the touchstone of a redesigned health system focused on improving health outcomes. Prevention advocates present the argument that prevention will save money, promote good health and provide a means for controlling health spending growth.

Target Population: The patient population that will be targeted for this intervention will be defined as those fitting in the lowest two quintiles of inpatients (over age 17) based on medical complexity, then further stratified as higher or lower social complexity. The target population pool (approximately 6,000 unique individuals) will come from the higher social complexity half and will, by definition, be primarily Medicaid and indigent patients.

Category 1 & 2 Expected Patient Benefits: Benefits include improved patient outcomes including decreased unnecessary ED visits/readmissions, increased access to needed care, and enhanced self-management skills as well as increased patient and family satisfaction.

Category 3 Outcomes: The FY16 goals include the following improved outcomes:

- IT.3.1: All Cause 30-day Readmission Rate

- Goal: Decrease readmissions rate from 8.74% (2,770/31,683) to 8.5%

Project Description

Parkland will implement a new care transitions program directed to socially complex patients to implement improvements and coordination of care from inpatient to outpatient, post-acute and home care settings in order to prevent unnecessary use of scarce health care resources.

Evidence indicates that social complexity factors play a meaningful role in predicting the risk of readmission – potentially equal to or of greater importance to medical complexity.[354] In recognition of the import of the challenges associated with social complexity, this project proposes to build a new care transitions program to focus on patients identified as having a high degree of social complexity. Research conducted by the Parkland Center for Clinical Innovation has identified social factors that contribute to risk for readmission. The social determinants that will be used to stratify the inpatient population include: gender, age, level of education, payer status, history of mental illness, history of cocaine, number of address changes, marital status, residence in high risk census tract, and admission time between 8 a.m. and 5 p.m. The risk stratification process will consider these factors and those established in other evidence-based research. The target patient population will consist of Parkland discharging adult inpatients with medical complexity consistent with the lower two quintiles for the Parkland inpatient population – a pool of approximately 12,000 unique patients. From that subset, the patient targets will include those in the higher half of social complexity – a target pool of approximately 6,000 unique patients.

Parkland will implement the new care transitions program modeled largely around "The Care Transitions Program" design of Eric A. Coleman, MD MPH. The project and program will be a new extension to the existing Care Coordination and Discharge Planning functions. The major activities of this project will include: care transitions model design and development, model implementation, post-implementation assessment, and ongoing monitoring and improvement.

Model Design

Many of the evidence-based care transitions models have been designed to address elderly patient populations. Although the Coleman model appears to fit well for the Parkland system requirements, a thorough review of the major models will be conducted to assure strong awareness of best practices as the care transitions model is tailored for the Parkland system and this socially complex target population.

Through engagement of a collaborative, cross-continuum team and using the STAAR tools, an analysis of the key drivers for both inpatient readmission and ED recidivism for the target

[354] Med Care. 2010 Nov; 48(11):981-8; An automated model to identify health failure patients at risk for 30-day readmission or death using electronic medical record data; Amarasingham R; Moore, BJ; Tabak, YP, et.al.

populations will be performed. The analysis will identify the factors that will be addressed through the tailored care transitions model.

As currently contemplated, the program activities will center around a team of Transition Coaches, envisioned to be multi-disciplinary team including nurse practitioners and supplemented by other expertise determined appropriate, who will engage with inpatients prior to discharge. The program interventions may include: in-hospital visits, home visits, clinic-based visits, and telephone contact with the patient and the patient family and caregiver(s). Significant goals for the program include substantial improvement in the patient's (or caregiver/guardian) self-management capability and confidence – specifically around medication self-management, health literacy and understanding of personal health history and record, ability to understand and complete necessary medical follow-up, and a recognition of, and understanding of how to respond to, changes in personal health condition.

Model Implementation

Upon completion of the model design and the target population refinement processes, prepare a comprehensive implementation plan. Based on the determinations made through the model design, the appropriate organizational design, leadership and staffing positions will be developed and recruited. The specific implementation steps will be dependent on the final design but will include the following activities: draft and finalize care transitions policies, procedures and protocols; determine and address practice and regulatory requirements related to the services to be provided; establish patient referral interfaces with hospital-based case management; establish data management and reporting capabilities; calibrate the health record to capture care transitions activities with full transparency within the Parkland system; and other activities appropriate to the final model design. A post implementation assessment will be a component of the implementation plan and will be conducted as indicated in the plan.

It is expected that by DY 5, the Care Transitions program for the socially complex patients will have an annual caseload of 1,250 patients. Because the social factors confronting many patients are difficult to address, the caseload has been conservatively estimated to be relatively low for the program.

Throughout the implementation steps, the implementation team will participate in internal and external learning activities including face-to-face learning meetings and "raise the floor" improvement initiatives.

Post Implementation Assessment and Continuous Improvement

A post implementation assessment will be a component of the implementation plan and will be conducted as indicated in the plan. The functional activities of the Care Transitions program will make use of system-wide performance improvement methods and practices.

Goals and Relationship to Regional Goals

The goals are to implement standardized care transitions program and increase the percentage of patients receiving standardized, evidence-based interventions for post discharge care/recovery per approved clinical protocols for care transitions.

Regional 9 goals include improved access to care, improved care coordination and improved provider performance and outcomes. A best-practice care coordination program supports the goals by improving access to appropriate care settings and coordinating care for the patient across the care continuum.

Challenges

The nature of the intervention's target patient population presents the immediate and daunting challenge. It is anticipated that the project team will leverage both internal Parkland knowledge and experience and that of other safety net and social organizations that work with this population. Many of the social problems present difficult if not intractable barriers to success.

As a new initiative, it will be imperative to establish and use clear protocols to identify and enroll targeted patients in the Care Transitions program. It will also be necessary to establish clear interfaces between this program and base Care Management and associated programs so as to best invest and direct the resources of the Care Transitions Program. Again as a new initiative, focused attention must be paid during implementation to measure and modify, as appropriate, the intervention design to assure that the desired outcomes are achieved.

5-Year Expected Outcome for Provider and Patients

Through this intervention, it is anticipated that the enrolled patients will engaged actively in creating a managed post-acute period that will yield benefit not only through the period of intervention enrollment, but will extend to ongoing activation in health self-management. The expected outcome is an increased number of patients who are more appropriately discharged and supported through the post-discharge period based on their complex needs, thus reducing 30-day readmissions.

Starting Point/Baseline

Of 31,683 inpatient discharges for adults (18+ years) in FY2012, All Cause Readmissions Rate was 8.74%~~;~~ The Care Transitions program does not exist today, so the starting point/baseline is 0 patients enrolled.

Rationale

Care transition programs facilitate the movement of patients from one care setting or health care provider to another. In order to improve patient outcomes with simultaneous reductions

in hospital costs, the transition of patients from inpatient to outpatient, and ultimately home is desirable. When patients have serious or complex medical or social problems, the transition of care becomes especially important. Patients may experience problems obtaining and managing their follow-up care treatments, taking and/or acquiring medications, or even understanding care protocols—even more the case among vulnerable and complex patients such as those served at Parkland. The care transition must be safe, effective and efficient to reduce the risk of errors and to achieve maximal benefit in terms of patient recovery.

Parkland Health & Hospital System is at capacity with 37,000+ discharges and 195,000+ patient encounters in the ED per year. Preventing unnecessary readmissions allows Parkland additional capacity and focus to care for patients who are currently in the hospital. Parkland is in the process of establishing a comprehensive case management program whereby significant adjustments to the care process can be made to insure appropriate transitions of care throughout the system including the implementation of a discharge planning program to hopefully reduce readmissions and inappropriate utilization of the ED.

Project Components

The required core components of Project Option 2.12.1 include the following:

a) Review best practices from a range of models (e.g. RED, BOOST, STAAR, INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc.). *Initial work on best practice review brought focus to the Coleman model – further evaluation will be performed as the Parkland model is designed and refined*.

b) Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool (e.g. the Institute for Healthcare Improvement's (IHI) State Action on Avoidable Re-hospitalizations (STAAR) tool) and patient interviews. *Readmissions data from the Dallas Fort Worth Hospital Council and information shared in Utilization Management meetings will be utilized to identify key drivers of readmissions* .

c) Integrate information systems so that continuity of care for patients is enabled. *Parkland has an integrated electronic medical record through EPIC and will review other modules to enhance EPIC specific to patients' complex needs*.

d) Develop a system to identify patients being discharged potentially at risk of needing acute care services within 30-60 days. *Analytic work will be performed with focus on patients at risk for readmission and for ED recidivism.*

e) Implement discharge planning program and post discharge support program. *This intervention will be designed to interface effectively with the existing Care Management and Discharge Planning functions.*

f) Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, etc. *This initiative will leverage and extend the work of cross-continuum teams focused on*

care management. Specific teams will be assembled to support model design, model implementation and post-implementation assessment activities.

g) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. *Organizations will have opportunities for face-to-face learnings. Also, groups such as "post-acute teams" may include hospitals and post-acute providers and meet to discuss patient needs. The group can determine collectively how to insure patients get appropriate care and the providers involved determine ways to work towards that (contracting, etc.).*

Milestones and Metrics

- P-1: Develop or implement best practices or evidence-based protocols (such as Partnership for Patients) for effectively communicating with patients and families during and post-discharge to improve adherence to discharge and follow-up care instructions
    - P-1.1 Metric: Care transitions protocols
- P-2: Implement standardized care transition process
    - P-2.1: Develop care transitions policies and procedures
- P-5: Using a validated risk assessment tool, create a patient identification system
    - P-5.1: Patient stratification system
- P-7: Develop staffing implementation plan to accomplish objectives of program
    - P-7.1: Documentation of staffing plan
- P-12: Participate in face-to-face learning (meetings/seminars) at least twice per year with other providers and RHP to promote collaborative learning around similar projects
    - P-12.1: Participate in semi-annual face-to-face meetings or seminars
    - P-12.2: Implement raise the floor improvement initiatives established at meeting
- I-10: Identify top conditions and other patient characteristics or socioeconomic factors that are common causes of avoidable readmissions
    - I-10.1: Identification and report of those conditions, socioeconomic factors or other patient characteristics resulting in highest rate of readmissions
- I-11: Improve percentage of patients in defined population receiving standardized care according to care transitions policies
    - I-11.1: Number over time of patients receiving standardized, evidence-based interventions per approved clinical protocols

Unique community need identification numbers the project addresses

- *CN.11 - Patient Safety and Quality*
- *CN.12 - Emergency Department Utilization and Readmissions*

How the project significantly enhances an existing delivery system reform initiative

Through the establishment of a comprehensive evidence-based Care Transitions program, care will be appropriately managed for patients from admission to discharge in a systematic, efficient/effective manner.

Related Category 3 Outcome Measure(s)

OD-3: Potentially Preventable Readmissions

- IT-3.1: All Cause 30-day Readmission Rate

The degree to which discharge planning is effective can influence the risk of admissions and readmissions for patients. Patients in the ED and/or hospital need to understand their discharge instructions for recovery and/or for transfer to another facility. Patients may not understand instructions or it may not be well communicated. Better communication can assist in preventing a health care issue from becoming more serious and requiring hospitalization or ED utilization. In particular, the degree to which staff members communicate with patients about their discharge needs and facilitate post discharge care can directly impact the risk of readmission. Readmissions will provide a measure to inform whether the care transitions process is successful for these patients.

Reasons/Rationale for selecting outcome measures

The current readmissions rate for Medicare beneficiaries is almost one in five and those readmission costs are approximately $15 billion annually.[355] Beginning in October 2012, the Centers for Medicare and Medicaid Services (CMS) was given authority to withhold reimbursements from hospitals with excessive readmission rates. Based on the Medicare Payment Advisory Commission's identification of seven top conditions and procedures that accounted for almost 30 percent of potentially preventable readmissions (including heart failure; chronic obstructive pulmonary disease; pneumonia; acute myocardial infarction; coronary artery bypass graft surgery; percutaneous transluminal coronary angioplasty; and other vascular procedures),[356] CMS decided to initially focus efforts on reducing preventable readmissions for congestive heart failure, acute myocardial infarction and pneumonia.

[355] NQF. "NQF Endorses All-Cause Unplanned Readmissions Measures." Release April 24 2012. http://www.qualityforum.org/News_And_Resources/Press_Releases/2012/NQF_Endorses_All-Cause_Unplanned_Readmissions_Measures.aspx

[356] Center for Medicare Advocacy - 2012. http://www.medicareadvocacy.org/2012/05/02/medicare-hospital-readmissions/

While the main intent is to lower readmission rates to improve patient outcomes, the Advisory Board[357] cites other reasons hospitals should focus attention on readmissions including potential financial penalties. Another reason cited and important for Parkland is with reduced readmissions, physicians and care teams can focus on providing quality care to current inpatients. Parkland is at capacity on any given day and when transitions of care are less than optimal there are a variety of baleful consequences: patient recovery suffers, patients are at higher risk of adverse events including medication errors, and patients may experience lapses and/or insufficient care. Readmissions and other adverse events are a disruption for patients and also for the staff who could be treating other patients. The multi-dimensionality of patient transitions from and to a variety of potential health care facilities and settings establishes the need for a truly effective discharge planning process which can reduce readmission rates.

Relationship to Other Projects in RHP Plan

The care transitions program is one component of Care Coordination Redesign and is being implemented in alignment with the patient care navigation program (127295703.2.7). The other related project is s127295703.2.5 – Assess cost effectiveness of post-acute care continuum.

Category 4 Related Outcomes

RD-2: 30-Day Readmissions for All Cause, Diabetes and AMI

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Related projects (Project Option 2.12) are submitted by performing providers and include:

Performing Provider	Unique Project
Baylor Medical Center at Garland	121790303.2.4
Baylor Medical Center at Irving	121776204.2.4
Baylor University Medical Center	139485012.2.4
Children's Medical Center	138910807.2.4

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 7.25 on a 9.0 scale. Factors that influenced this score included:

- The strong impact this project will have with respect to intervening with patients among Parkland's vulnerable population at highest social risk for to prevent future complex and/or costly care
- Cost avoidance by providing streamlining and enabling program patients to obtain the right care in the right place at the right time
- Opportunities for partnership and collaboration with the many performing providers in RHP 9 that are pursuing care transitions projects

The value (ratio of benefits to costs) of early intervention and prevention is always difficult to quantify and document. As a primary prevention project, the value produced this intervention program will be accomplished by facilitating stabilization, encouraging patient activation, improving health literacy with the result of preventing or delaying the onset of the acute and chronic diseases that account the most costly health care services.

Health Management Associates (HMA) published a paper in November 2008 that surveyed the literature with respect to evidence of savings associated with chronic disease management.[358] The paper indicates evidence that chronic disease management programs can yield savings ranging from 2.72 to 32.7 dollars saved per dollar invested. The paper also notes that costs tend to be relatively modest, ranging from $100 to $1399 per capita. These factors are extended with respect to the Parkland Care Transitions program enrollment targets in the table below as a demonstration of the range of value that could be derived from this prevention intervention.

Parkland Program Enrollees	Potential Per Capita Program Costs	Ratio of Dollars Saved to Dollars Spent	Potential Value Range
750	$100 - $1399	2.72 to 32.70	$204,000– $ 34,310,475
1,250	$100 - $1399	2.72 to 32.70	$340,000– $ 57,184,125
			$544,000 - $91,494,600

[358] Chronic Disease Management: Evidence of Predictable Savings, Health Management Associates; Jack Meyer, PhD and Barbara Markham Smith, JD November 2008.

The range of potential value is extremely wide, but demonstrates the potential for significant value to be produced by the preventing or delaying the onset of chronic disease.

Project Option 2.4.3 – Patient Satisfaction: Improve Patient Experience for Inpatient Care

Unique Project ID: 127295703.2.10

Performing Provider Name/TPI: Parkland Health & Hospital System /127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention. This project seeks to improve the inpatient satisfaction scores for Parkland by creating a position on the senior leadership team responsible for developing an effective service excellence program.

Need for Project. The most recent Hospital Compare patient satisfaction survey overall score for Parkland's inpatient was reported at 65% which is below the Texas and national average.

Target Population. The target population includes all patients who have an inpatient stay at Parkland and are eligible for an HCAHPS survey (according to CMS inclusion/exclusion criteria). While the largest group of Parkland's inpatient payer mix is unfunded/Medicaid (76%), this initiative is not payer specific and will be directed to include all patients.

Category 1 or 2 Expected Patient Benefits: This project seeks to improve the patient experience at Parkland as will be determined through the Press Ganey and HCAHPS patient satisfaction survey tools.

Category 3 Outcomes: The FY2016 outcome will be improved patient satisfaction.

- IT-6.1-Percent improvement over baseline for patient satisfaction scores. Goal is to improve patient satisfaction scores for those patients rating 9 or 10 out of 10 on HCAHPS overall rating score by 6 percentage points from baseline.

Project Description

This project proposes to target improvement in Parkland's inpatient satisfaction score, as measured by the HCAHPS instrument and supplemented by Press Ganey's validated metrics, innovative, data-driven solutions and strategic consulting. To meet this goal and support institution-wide enhancement of customer service delivery, customer service must be restructured and centralized as a system-wide function under the leadership of a Service Excellence Manager. We anticipate this project to serve and to improve the experience of care for approximately 145,556 inpatients over the demonstration period (DY2-DY5) based on the adult FY2012 yearly volume in the table above. We do currently randomly survey a large proportion of inpatients, yielding a total of 5,926 returned surveys for FY2012.

A Service Excellence Manager (1 FTE) position and appropriate support staff will be recruited. The Service Excellence Manager's purview will include responsibilities for facilitating and coordinating hospital-wide performance improvement initiatives and unit-level service excellence consulting. This role is a well-established industry "Best Practice" model for customer service enhancement and ultimately the improvement of patient satisfaction scores.

The Service Excellence Manager shall report directly to a senior member of the hospital executive team such as the Chief Operating Officer or other senior level operational vice president role. The Service Excellence Manager will have institutional authority to implement performance improvement initiatives, standards of behavior, staff training, and reinforcement programs house-wide as necessary to fulfill the goal of improving customer satisfaction.

Patient satisfaction survey administration will remain supported by the Health Systems Research Department, and the function of coordinating all aspects of survey administration and report distribution will remain with the current survey administrator and support staff, as well as providing the primary liaison role with the survey vendor.

In addition to the new position for Service Excellence, specific objectives of this project include:

a) Establish and chair a steering committee to monitor/coordinate improvement activities

b) Promulgate and enforce codes of conduct regarding staff interactions with patients

c) Work with HR Department to develop new employee screening for service excellence aptitude and establish minimum thresholds for employment

d) Identify and implement performance improvement initiatives

e) Implement and monitor a house-wide process to reward and recognize high performers

f) Participate in learning collaboratives with providers, vendors, and other professional associations

Goals and Relationship to Regional Goals

The goal of this project is to target improvement of Parkland's inpatient satisfaction score, as measured by the HCAHPS instrument and supplemented by Press Ganey's validated metrics.

RHP 9 regional goals include improved access to care, improved care coordination and management and improved provider performance (quality, clinical and financial outcomes). Although not specific to quality, clinical or financial outcomes, this initiative is to improve provider performance specific to patient satisfaction as one of Parkland's strategic objectives.

Challenges

Motivating inpatient clinical staff to focus and expend energy on patient satisfaction improvement and customer service excellence is a major challenge. Performance improvement strategies targeting satisfaction are not traditionally embraced by physicians, nurses, and clinical staff, although that culture is necessarily changing. Understandably, providing top quality medical care, while avoiding medical errors is at the forefront of bedside staff's mind. Parkland's patient population is highly complex and requires precision and focus on the medical care provided. Redirecting their focus requires extra effort as their time is constrained with the volumes of patients Parkland sees. However, establishing a centralized role to identify high and poor performance, establish targets and promulgate results and to help implement and support improvement activities will provide clinical staff the resources and motivation necessary to achieve those improvements.

5-Year Expected Outcome for Provider and Patients

The outcome of this project is to increase inpatient HCAHPS scores from the current levels. This DSRIP 5-year goal is to improve the percentage of patients rating 9 or 10 out of 10 on the HCAHPS "Overall Rating" question scores to minimally exceed current CMS established Value-Based Purchasing Achievement thresholds (VBP; CMS Final Rule April 2011) by year 5. Further, to achieve statistically significant improvements in the Press Ganey proprietary standard question overall mean score, and achieve the 25th percentile of the Press Ganey University Healthcare Consortium client benchmark by year 5 for inpatients.

Starting Point/Baseline

Baseline measurements already exist and will continue to be measured for both HCAHPS and Press Ganey's standard overall mean score. The HCAHPS baseline is 64% of patients who score '9 or 10' out of 10 on the "Overall Rating" question on the patient survey[359].

The Press Ganey baseline to be used is 83.6, which is the mean of the standard questions.[360]

Rationale

Parkland has identified patient satisfaction is a strategic goal for the organization. However, there has been little to no improvements in inpatient satisfaction scores since the contract arrangement with Parkland's new vendor, Press Ganey - CMS certified HCAHPS vendor, began April 1, 2011. Regarding the CMS-mandated HCAHPS measures, Parkland's publically reported "Overall Rating" score has declined 4 percentage points from the July 2010-June2011 reporting period to the most recent publically reported period of April 2011-March 2012 (from 68% Top Box to 64% Top Box respectively). The Press Ganey proprietary inpatient measures have vacillated up and down minimally and have remained within a point or two of the same mean score since the survey's implementation. Parkland's overall satisfaction rating using the Press Ganey metrics has been in the bottom fifth of percentile ranks in three different benchmark groups since the first quarter of measurement.

Excellence in patient care requires an understanding of the patient's perception of the quality and services they received. Patient centered satisfaction surveys measure quality of care and service from the patients view point and are thus, indicators of the hospital's performance. Their goal is to help hospitals monitor quality of service and elucidate opportunities for improvement; thereby, facilitating the development of strategies to enhance quality and those services. Most importantly an institution's success is the creation of experiences that meet and exceed patient expectations. Toward that end, patients' evaluations of services are necessary for performance improvement so that successes can be celebrated and service deficiencies identified and corrected. Equally important is insuring patient satisfaction reports are brought to executive leadership through a regularly scheduled executive report/dashboard. This is being implemented and patient satisfaction will be an element of that dashboard.

A best practice is to have a consolidated organization-wide effort towards patient satisfaction. This effort requires strong support from executive leadership, thus establishing a role at that level within the organization sets direction. Current service excellence initiatives are fragmented, inconsistent, and generally lack the momentum necessary to produce institution-wide improvements in satisfaction scores and percentile rankings. Resource recovery, patient complaints and grievances are addressed by the Patient Relations Department, while the patient satisfaction survey is administrated by the Health Systems Research Department and

[359] CMS Hospital Compare Preview Report: Improving Care Trough Information—Inpatient Hospital Performance. Reporting period is April 2011 through Mar 2012 Discharges

[360] Press Ganey on-line reporting tool – FY2012

hospital services, units and departments are individually and autonomously responsible for initiating and implementing patient satisfaction performance improvement processes.

Project Components

There are no required core components for Project Option 2.4.3 - Other option to implement an innovative and evidence-based intervention that will lead to improve patient satisfaction for providers that have an identified need or unsatisfactory performance in this area.

Milestones and Metrics

- P-1: Appoint Service Excellence Manager executive accountable for experience performance
    - P-1.1: Documentation of executive assigned responsibility
- P-3: Establish steering committee comprised of exec. leaders, staff and patient families to implement improvements in patient experience (Chaired by Service Excellence Manager)
    - P-3.1: Documentation of committee proceedings and list of committee members
- P-X: Implement and monitor a house-wide process to reward and recognize customer service high performers, motivate low performers
    - P-X.1:
        a) Widely promulgate/re-enforce codes of conduct re: staff-patient interactions
        b) Establish service standards & targets
        c) Establish performance indicators, incentives, and reinforcements
        d) Participate in learnings with providers, vendors, professional associations
- P-X: Establish and train "Service Coaches" from among front line inpatient clinical management staff to train their bedside staff about service standards of behavior, customer service excellence initiatives, and behaviors
    - P-X.1: Conduct Service Excellence training sessions among inpatient clinical managers. Promulgate and reinforce codes of conduct re: staff-patient interactions
- P-X: Establish new employee screening procedures for service excellence aptitude.
    - P-X.1: Work with HR Department to develop/implement new employee screening for service excellence aptitude. Establish minimum thresholds for employment.
- P-17: Review project data and respond with tests of new ideas, practices, tools, solutions
    - P-17.1: Number of new ideas, practices, solutions tested
- Data Source: Description of new ideas, practices; summarized quarterly
- I-18: Develop regular organizational display(s) of patient experience data dashboards.
    - I-18.1: Number of organization-wide displays re: patient experience performance
- I-Y: Develop regular organizational display(s) of reward and recognition program
    - I-Y.1: Number of organization-wide displays - reward/recognition

- I-16: Improve inpatient satisfaction/experience scores on HCAHPS composite domains & selected Press Ganey proprietary "priority driver" questions
    - I-16.1: Percent improvement over baseline of patient satisfaction scores for a specific tool. (HCAHPS composite domain question scores)
    - I-16.2: Percent improvement over baseline of patient satisfaction scores for a subset of targeted improvement measures (Press Ganey individual question scores)
    - I-16.3: Demonstrate increase in performance relative to other providers in same RHP and other RHPs, and in contrast with state benchmark

Unique Community Needs Identification

There are no specific community needs identified for patient satisfaction

How the Project significantly enhances an existing delivery system reform initiative

Patient satisfaction is a strategic initiative for Parkland and while this initiative has specific and new recommendations, the initiative itself – to increase patient satisfaction – is not new. All of the recommended projects have an innate objective to increase patient satisfaction for our patients. Strategically, all projects are to improve the key elements of the care continuum to provide our patients more access to care when they need it and also services to address their non-medical care needs (such as interpretation services), which will improve patient outcomes and patient satisfaction.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-6: Patient Satisfaction

- IT-6.1: Percent improvement over baseline of patient satisfaction scores

Patient-centered care includes patients' perceptions about the quality and their satisfaction with that care. Satisfaction surveys measure quality of care and service from the patients view point and are thus, indicators of the hospital's performance. Most importantly an institution's success is the creation of experiences that meet and exceed expectations. Monitoring improvements in that success by using publically reported data will create incentives for staff to improve their patients' experience of care.

Relationship to Other Projects

There are no related Parkland projects although patient satisfaction is an organizational goal for all departments and as such is an objective for every project.

Category 4 Related Outcomes

- RD-4: Patient-centered HealthCare: Patient Satisfaction

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborates

RHP 9 projects focusing on patient satisfaction have been submitted and include:

Performing Provider	Unique Project
Denton Regional Medical Center (HCA)	111905902.2.2
Las Colinas Medical Center (HCA)	020979301.2.2
Medical Center of Lewisville (HCA)	094192402.2.1

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcomes Learning Collaborative that is associated with project outcomes to obtain additional perspectives that may enable improvement of the project. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance this project's success.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 5.30 on a 9.0 scale, mostly due to the specific focus of this project to improve the patient experience at Parkland.

Patient satisfaction has been previously linked in the literature to a number of outcomes for patients and organizations both medical and financial. Better patient satisfaction has been associated with reduced risk of medical malpractice lawsuits. In one study patients in the bottom third of the Press Ganey benchmarks were 110 times more likely to experience malpractice law suits than those in the top third (Stelfox, Gandhi, Orav & Gustafson, 2005)—Parkland inpatient satisfaction scores have been consistently in the bottom third of Press Ganey's benchmarks. Law suits have also been shown to be significantly related to number of patient complaints (Press Ganey 2007). Service recovery and improved satisfaction scores can be expected to mitigate liability exposure, while better patient satisfaction has been shown to increase revenue. One study of physician practices determined that a 5% dissatisfaction rate equated to a $150,000 loss per physician in revenue (Drain & Kaldenberg, 1999). In 2006, malpractice payments averaged $308,593 (Kaiser Family Foundation 2007) per claim, largely due to poor communication between patients and physicians not negligence (23% of claims result from negligence; Phillips et.al. 2004)

Improved patient satisfaction has been repeatedly associated with financial ROI (return on investment). All studies indicate increases in net operating margins with improved patient satisfaction, especially among those at the top deciles (Press Ganey 2010). Further, numerous studies report that satisfied patients cost less to care for because they use fewer resources and experience fewer stress complications. For example Duke Children's hospital increased patient and employee satisfaction yielded an average $4,389 reduction in cost per case (Meliones 2000), while Baptist Health System achieved and average reduction of $1,154 (Jackson, Sistrunk, & Staman, 2003). Moreover Baptist Health System, with an increased focus on patient satisfaction, experienced a length of stay drop of 1.3 days (Jackson, Sistrunk, & Staman, 2003). Overall, patients who are satisfied with their care do not complain as much, do not want to sue, have fewer complications, and are associated with improved staff and physician engagement.

Given the financial impacts of improving patient satisfaction based on the above studies, this project may potentially return a cost savings to the organization of between $167,971,624 and $638,845,284 over four years (36389 inpatients per year*$1,154 or $4,389*4 years) or per DY average ranging from $41,992,906 to $159,711,321.

Using the reduced LOS figure of 1.3 and Parkland's FY11 patient data (FY11 Adult inpatient volume 36,276), a potential DY savings of $62,197,155.00 could be obtained by the cost savings associated with the reduced LOS (FY11 LOS=5.1/Direct Cost per patient $6,724; Revised LOS=3.8/Direct Cost per patient $5,009; cost per patient savings $1,715; 36,389*$1,715=$62,197,155.00 per DY savings)

Either methodology regarding reduced cost per case or reduced costs per patient LOS produces an amount which is potentially well in excess of the $24,776,800 valuation, even without the potential savings that could be realized by reductions in malpractice lawsuit awards.

Project Option 2.1.1 – Enhance/Expand Medical Homes – Family Medicine

Unique Project ID: 127295703.2.11

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention. This project will increase the number of patients enrolled in medical homes within the campus-based primary care clinics – Family Medicine and Primary Care Internal Medicine (PCIM). The clinics, unlike the COPC primary care network, are campus-based teaching clinics that provides approximately 40,000 clinic visits annually.

Need for Project. Parkland provides almost 1 million clinic visits (62% unfunded/19% Medicaid) and 200,000 ED visits (64% unfunded/22% Medicaid) annually. The medical home model provides the opportunity to better coordinate care for those patients who may be accessing the system in an ineffective, sporadic manner. For Parkland, capacity is reached in the ED and the clinics and without improving the coordination of care for patients who need care management, there can be no relief to the care delivery infrastructure. Currently, Parkland provides less than ¼ of the care needed for the population <200% FPL in Dallas County. The

demand for primary care will always outrun supply in Dallas County but better coordination of care may provide some relief and also will improve care for those enrolled in the medical home. The Family Medicine and the PCIM clinic each provide approximately 20,000 annual visits, of which the majority of visits are for diabetes and hypertension so the medical home model will be utilized to improve care management of identified populations that utilize campus-based primary care services.

Target Population. In FY2012, the Family Medicine Clinic provided 19,259 visits and the PCIM clinic provided 19,209 visits. More than 80% of the patients seen in Parkland's ambulatory clinics are unfunded/Medicaid. The target population includes patients seen in the Family Medicine and PCIM clinics and the focus will be on enrolling patients into the medical home. The anticipated number of patients to be enrolled through the campus-based primary care clinics is approximately 5,000 (15% of the total).

Category 1 or 2 Expected Patient Benefits. This project seeks to increase the number of primary care campus-based clinic patients who are managed through the medical home model.

Category 3 Outcomes/Goal. The Family Medicine clinic has established the following FY16 goals:

- IT-1.1: Third next available appointment
  - Goal: Reduce the wait from 28 to 20 days (Family Medicine)
- IT-1.12: Diabetes – retinal eye exams
  - Goal: Increase % of patients with diabetes who receive retinal eye exams from 48% in FY12 (235/483) to 80%.
- IT-1.13: Diabetes – foot exams
  - Goal: Increase % of patients with diabetes receiving foot exams from 21% in FY12 (105/483) to 80%

Project Description

Parkland's campus-based primary care clinics - Family Medicine and Primary Care Internal Medicine (PCIM) clinics will achieve NCQA designation as a Medical Home and enroll eligible patients into a medical home model. In a collaborative effort, UT Southwestern will implement workforce training regarding medical home concepts to improve patient outcomes and better meet future health care challenges for residents in Dallas County.

Parkland is the largest provider of primary care for uninsured and low-income patients in Dallas County. While the Parkland COPC network of primary care clinics provides the lion share of primary care services to Parkland patients, the Family Medicine clinic and PCIM clinic provides approximately 40,000 annual visits. The clinics are campus-based teaching clinics with UTSW faculty attending physicians. In an effort to insure focus is consistent, Parkland will seek NCQA designation as a Patient-Centered Medical Home and UTSW will provide necessary training and education to insure providers are well-versed in the PCMH model, its vision and rationale.

Goals and Relationship to Regional Goals

Regional goals include improved access to care, improved care coordination and management and improved provider performance (quality, clinical and financial outcomes). The medical home model provides the foundation to all of these goals. Patients who have designated medical homes have better access to the care they need through a medical home team who coordinates and manages their care throughout the continuum. The medical home model also establishes the infrastructural elements for improved performance through an established panel of patients and standardized protocols/ polices/ procedures related to diseases and chronic conditions. By seeking NCQA designation, the clinic providers are committed to implementing the patient-centered medical home model in that clinic.

UT Southwestern intends to establish more training and educational opportunities in the campus-based clinics by enhancing the current curriculum to insure the future workforce is prepared to care for patients in a medical home model.

Challenges

The biggest challenge for Parkland is demand for primary care services is 4 times the supply in Dallas County for the low income population (<200% FPL). Per the Community Health Needs Assessment more than 43% of the Dallas County population (2.4 million) has an income below 200% of FPL and Parkland currently provides less than ¼ of the need for primary care. The Family Medicine Clinic is one clinic serving this population in providing 20,000 annual visits in a traditional teaching model. To incorporate the medical home model, a broader medical home team must be put into place and every inch of current clinic space utilized and with current capacity constraints, some innovative ideas are required to add staffing and space without reducing patient volume.

5-Year Expected Outcome for Provider and Patients

The outcome will be more patients enrolled in a medical home model and receiving coordinated and well-managed care. Additionally, with a focus on training the workforce, there is opportunity to insure clinicians will have adequate education/training regarding the medical home concept and as residents move on, they will take that education and training with them thus creating a ripple effect as more providers utilize the medical home concept in their practice across the region, state, nation.

Starting Point/Baseline

In fiscal year 2012 the Family Medicine clinic provided 18,116 completed appointments (19,259 total visits). Specifically, Family Medicine clinic providers treated 483 patients with diabetes in FY12. The current third next available appointment for the campus-based clinic is 28 days out.

Rationale

The Patient-Centered Medical Home (PCMH) model promotes long-term partnerships between physicians and patients as well as a coordinated team approach to primary health care. The care team comprised of a physician, nurse and case manager is assigned to each family and takes a proactive approach to care by addressing all the patient's needs at one appointment. Depending on the patient's needs, support may come from other staff members such as dietitians, financial counselors, mental health providers and language support specialists. The 2011 standards for Patient-Centered Medical Home are as follows[361]:

1. Enhance Access/Continuity
2. Identify/Manage Patient Populations
3. Plan/Manage Care
4. Provide Self-Care Support/Community Resources
5. Track/Coordinate Care
6. Measure/Improve Performance

The Patient-Centered Primary Care Collaborative released a report that concluded there has been an improvement quality of care and patient experience while reducing cost of care on some measures including ED utilization.[362] Other research has shown similar findings as well as reduced use of hospitalization and overall savings.[363] Yet another study evaluated a PCMH project in a group practice and found not only significant improvement in the quality of clinical care and patient experience but also in provider experiences (reduced burnout).[364]

In addition to improved quality outcomes, the medical home model provides a coordinated care approach and as more providers utilize the model to care for patient with specific needs, the care continuum can be more appropriately balanced. Patients within the medical home will be less likely to seek care in inappropriate settings such as the ED. With a more focused set of patients designated for providers, patients who need intermittent care can be directed to other providers based on their availability. The shift to identifying panels must occur to streamline the care by type of patient (in need of medical home, in need of intermittent care, etc.) and develop the care continuum based on patient acuity and need to be seen.

Project Components

Parkland proposes to meet all required project components for this project including:

a) Utilize gap analysis to asses/ measure hospital-affiliated PCPs' NCQA PCMH readiness. *Family Medicine and PCIM physicians meet with COPC physicians and staff and are developing an operational readiness assessment for medical home achievement.*
b) Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status. *The Family Medicine and PCIM clinic leadership will perform a feasibility study in parallel with the operational readiness assessment.*
c) Conduct educational sessions for primary care physician practice offices, hospital boards, medical staff and senior leadership on PCMH (elements, rationale and vision). *Parkland and UTSW will insure training/education provided is appropriately provided within the clinics.* Conduct quality improvement for projects using methods such as rapid cycle improvements. *An opportunity for quality improvement can be the care management of specific patients identified by Family Medicine and PCIM clinic providers. Learning opportunities include face-to-face meetings with other providers in specialty care and the general internal medicine clinics*.

Milestones and Metrics

- P-2: Put in policies and systems to enhance patient access to medical home. Enhanced access to care is available through systems such as open scheduling
    - P-2.1: Performing Provider policies on medical home
- P-4: Develop staffing plan to expand primary care team roles; expand and redefine roles and responsibilities of primary care team members
    - P-4.1: Expanded primary care team member roles
    - P-4.2: Schedule training/educational opportunities for providers and staff on roles
- P-3: Reorganize staff into primary care teams responsible for coordination of patient care
    - P-3.1: Primary care team
- P-5: Determine appropriate panel size for primary care provider teams, potentially based on staff capacity, demographics, and diseases
    - P-5.1: Determine panel size
- P-14: Participate in face-to-face learning twice/year with providers and RHP to promote collaborative learning around shared or similar projects
    - P-13.1: Participate in semi-annual face-to-face meeting/seminar
- I-18: Obtain medical home recognition by nationally recognized agency (NCQA, etc.). Level will depend on practice baseline and accrediting agency.
    - I-18.1: Medical home recognition/ accreditation
- I-12: Based on criteria, improve number of eligible patients assigned to medical home
    - I-12.1: Number or percent of eligible patients assigned to medical homes where "eligible" is defined by Performing Provider
- ~~I~~**Community Need Assessment Identification Number**:

- *CN.4 – Health Care Capacity*
- *CN.9 – Need for care coordination for Chronic Disease*

How the Project significantly enhances an existing delivery system reform initiative

This initiative will provide the opportunity for the campus-based primary care clinics to prepare for and achieve NCQA designation as a PCMH. This will provide the opportunity for patients who may not utilize the COPC network to have a medical home.

Also this project provides an opportunity for Parkland and UT Southwestern to incorporate the medical home model into education/training of the future medical workforce.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-1: Primary Care and Chronic Disease Management

- IT-1.1: Third Next Available Appointment (Non-standalone Measure)
- IT-1.12: Diabetes care: Retinal eye exam – NQF 0055 (Non-standalone Measure)
- IT-1.13: Diabetes care: Foot exam – NQF 0056 (Non-standalone Measure)

Third Next Available Appointment. This measure is the industry standard measure for determining wait times for scheduled appointments.

Diabetes: Retinal Eye Exam. Diabetic retinopathy, one of the leading causes of blindness in adults, can be treated if detected and addressed in the early stages.[365] Medical teams will ensure patients with diabetes receive retinal eye exams as well as access to other services including ADA-certified diabetes self-management classes and services provided by certified diabetes educators/pharmacists.

Diabetes: Foot Exam. The lifetime risk of a person with diabetes developing a foot ulcer can be as high as 25%.[366] The most common set of causes that interact and result in foot ulcerations includes peripheral neuropathy, deformity, and trauma.[367] Identification of patients at risk of foot problems is the first step in preventing such complications and thus is a key measure.

Relationship to other Projects

Parkland is submitting a related project to enhance the medical home model in the COPC primary care system (127295703.2.1).

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Other related projects (Project Option 2.1) are being submitted by performing providers and include the following:

Performing Provider	Unique Project
Children's Medical Center	138910807.2.1
Medical City Dallas (HCA)	020943901.2.4
Methodist Dallas Medical Center	135032405.2.3
Tenet – Doctors Hospital at White Rock	094194002.2.1
Texas Health Presbyterian Dallas	020908201.2.3
UTSW – Faculty Practice Plan	126686802.2.1

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives appropriate to this project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. Parkland will also participate in any Outcome Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable improvement of the program and also provide information to other providers who may see the benefits of the program for ideas to improve their services. The exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 9.0 on a 9.0 scale. Influencing factors included:

- By advancing the medical home model even further, this project will yield the additional value with respect to the 20,000 annual visits in the Family Medicine clinic and 20,000 annual visits in the Primary Care Internal Medicine clinic
- Opportunities for partnership and collaboration with the many RHP 9 performing providers that are pursuing the medical home model
- Opportunities to increase capacity for specialty care services (some patients who would be better served in a medical home are currently utilizing specialty care services)

- Opportunities to decrease ED utilization for those better served in a medical home
- Sustainability in practice for Parkland's patient population
- Training of future workforce regarding medical home model concepts

The PCMH model has demonstrated benefits in terms of both quality and cost. A Geisinger Health System study indicated that the implementation of their advanced patient-centered medical home yielded from 6.7% to 10.8% reduction in PMPM observed cost relative to expected cost at 24 months from implementation.[368] Applying the cost reduction percentages to an average Medicaid PMPM extended by the number of medical home enrollees proposed by this project, the potential cost savings value that could be generated based on the medical home enrollment associated with this project aligns well with the project value.

Waiver Year	Proposed Parkland PCMH Enrollees	Average Medicaid Adult PMPM	Cost Savings Range	Potential Cost Savings
DY4	2,575	$371.60	6.7-10.8%	$ 769,323– $ 1,240,103
DY5	5,200	$371.60	6.7-10.8%	$ 1,553,585– $ 2,504,286
				$ 2,322,908– $ 3,744,389
Category 2 and associated Category 3 Total Project Value				$19,175,310

We realize the Geisinger model is a conservative approach to valuation for this project. A recent study shows 20% of the patients Parkland cared for in FY2012 have 15 or more comorbidities. These patients come through the Parkland Health & Hospital system many times and through many sites (ED, clinics, etc.) – and many search available access points until they find one. They have no connected home base where providers and staff can better coordinate their care. Of 290,000 unique patients, if 20% (58,000) could be targeted for enrollment in a medical home, that would alleviate significant burden to ~~all~~ access points at Parkland including the ED. Focused efforts on enrolling 5,000 who already utilize the campus-based primary care clinics is a strong start in this effort.

Project Option 2.8.4 – Apply Process Improvement Methodology to Improve Quality/ Efficiency – Enhance OPAT Program to reduce readmissions

Unique Project ID: 127295703.2.12

Performing Provider Name/TPI: Parkland Health & Hospital System/127295703

Summary Description

Provider: Dallas County Hospital District d/b/a Parkland Health & Hospital System, "Parkland", is the public hospital and the largest major safety net hospital serving Dallas County and, in accordance with its mandate, furnishes medical aid and hospital care to the indigent and needy persons residing in the hospital district. As presented in the table below, Parkland is a critical provider in the region, particularly for the low income population. Parkland's payer mix includes 48% Charity/Self Pay, 31% Medicaid, 14% Medicare and 7% Commercial Insurance.

Parkland operates a 725-adult bed and 65-neonatal bed acute care hospital, a Level I Trauma Center with the only ACS certified burn center in the region, 95 Specialty Clinics, 12 community health centers and 11 school-based clinics located throughout Dallas County. On an annual basis, the Parkland system provides care to approximately 290,000 individuals through approximately 1,400,000 encounters. Fiscal Year 2012 Statistics include:

Services	FY2012 Volumes	Parkland Share of Dallas County Adults	
		% Market Share	Medicaid/ Self-Pay/ Charity
Discharges	37,515		
- Adult	36,389	17%	42%
- Neonatal	1,126	27%	39%
Emergency Services	195,947	23%	36%
Deliveries	11,348	30%	46%
Ambulatory Visits	1,031,311	n/a	n/a
- Community Centers	446,646		
- Women's Center	239,825		
- Subspecialty	344,840		

Intervention. This project will expand capacity of the Outpatient Parenteral Antimicrobial Therapy (OPAT) program. The OPAT program is a post-discharge program that allows patients receiving antibiotics in the hospital to be discharged in order to self-administer their medications at home, reducing lengths of stay on average 4-6 weeks per patient. Patients eligible for the OPAT program are provided education/training to administer their medications through PICC lines and are monitored by clinicians weekly in a dedicated post-discharge clinic.

Need for Project. At any given time, discharges are delayed for patients because they need medications administered through a PICC line for 4-6 weeks. For the indigent patients eligible to participate in the OPAT program, there is no post-acute alternative so they remain in the hospital to assure they receive medications, which increases costs for those hospital stays and

denies availability of that inpatient bed for other patients with more severe needs. Parkland's ED averages more than 500 patients per day of which many are placed on a wait list until beds open, requiring space and additional staff to hold patients in the ED or another unit until beds become available.

According to Dr. Kavita Bhavan (Clinical lead for the OPAT program) eligible OPAT patients can be trained to self-administer their medications at home can be discharged on average 28 days sooner. Based on the decreased ALOS, the OPAT program has the opportunity to expand to 600-650 patients which could potentially save the hospital $41,259,400 (average cost of $2,267 per day x average days saved 28 x 650 patients).

Target Population. The OPAT program currently provides care to indigent patients only who are eligible for discharge with a PICC line if they are able to self-administer medications at home. This population is targeted because of the lack of post-acute home care services available. In FY2012, 1,582 patients were identified as eligible for OPAT services but with current constraints, only 353 patients were enrolled (those 353 patients are seen once a week in the clinic for 6-8 weeks).

Of the OPAT patient population, more than 68% are diabetic, which is of particular interest. Parkland cares for more than 30,000 people who have been identified as diabetic or at risk for becoming diabetic. This patient population is the focus of several waiver projects with the intention of addressing this population's specific needs and improving their care throughout the health system (from primary to specialty care to inpatient and to post-acute care services).

Category 1 or 2 Expected Patient Benefits. This project seeks to increase program capacity to accept more patients into the program. Benefits include reduced lengths of stay, reduced 30-day readmission rates and improved infection rates at PICC line insertion site.

Category 3 Outcomes/Goal. Parkland defined the following FY16 outcomes:

While there are several improved outcomes including the ALOS per patient being reduced by 4-6 weeks, the outcome for this project is as follows:

- IT-3.12-Other – All Cause Readmission Rate for patients enrolled in OPAT program
  - Goal: Reduce All-Cause 30-day Readmissions Rate for patients enrolled in OPAT from 65% (FY11 baseline) to 20%

Project Description

Parkland Health & Hospital System will expand the OPAT program, which is an innovative and evidence-based intervention leading to significant decreases in lengths of hospital stays as well as improved outcomes for patients.

Parkland will expand the Outpatient Parenteral Antimicrobial Therapy (OPAT) program that provides indigent patients the self-management skills necessary to self-dispense antibiotics at

home through a PICC line. This process improvement project has been successful since its inception in 2009 in decreasing lengths of stay as well as readmissions for OPAT patients (the readmission rate for these patients has already been decreased from 65% to 27%).

Patients are identified as eligible to participate in the OPAT program if they are indigent and the treatment plan is for them to remain in the hospital simply to receive medications. Staff nurses who work with the OPAT team train patients who want to enroll in the OPAT program so they can self-administer their medications. Patients can then be discharged and monitored through the OPAT outpatient clinic on a weekly basis throughout their medication regiment. Clinic visits include the following: 1) Monitoring patient blood levels, 2) Insuring patient is getting the right amount of the antibiotic, 3) Providing fresh, sterile dressings over PICC line, and 4)Insuring there is no infection at PICC insertion site.

The intent of this project is to enhance/expand the Outpatient Parenteral Antimicrobial Therapy (OPAT) program through the following:

1) Increase staff resources (mid-level providers)

2) Continued process improvements such as:
- Development of training/education materials and tools for patients. The program team intends to develop training materials including DVDs developed in Spanish and English for ease of understanding how to self-manage post-discharge recovery and self-administer medications, etc.
- Preventing or slowing antimicrobial resistance through appropriate selection/dosing/route/duration of microbials
- Establish Antimicrobial Stewardship Team to :
    - Develop guidelines, protocols and/or restrictions for safe and appropriate use of antimicrobials
    - Evaluate targeted antimicrobial usage
    - Assure adherence to standards concerning use of antimicrobials
    - Review clinical interventions and adverse drug events secondary to antimicrobials
    - Educate medical staff on appropriate use of antimicrobials
- Enhance clinical decision support to monitor ADT, lab and pharmacy orders continuously and provide daily alerts for “inappropriate antimicrobial utilization”
- Identify possible improvements and efficiencies including cost savings. The program team determined they can also save the hospital as much as $450,000 per patient in drugs switching from Daptomycin (averaging $100 cost per day) to Vancomycin (averaging $10 cost per day).

3) Increase current OPAT clinic space on the main hospital campus

4) Implement innovative ideas such as providing OPAT services at the primary care clinics so patients can stay in their communities for weekly follow up visits

Goals and Relationship to Regional Goals

The goal of this project is to expand/enhance the OPAT program and increase the volume of patients who could be enrolled in the program, which will provide those patients with the skills to self-manage their medications at home and will provide significant reductions in LOS (approximately 4-6 weeks per patient). Since its inception, this program has proven to not only decrease the ALOS for eligible patients, but also decrease readmissions and decrease PICC line infection rates. The outcomes for this project are to further decrease he readmission rate and the average length of stay (ALOS) for enrolled patients.

Regional goals include improved access to care, improved care coordination and management and improved provider performance and outcomes. The OPAT program is a foundational program for all of these goals. It provides access to the more appropriate setting of care for indigent patients who previously remained in the hospital only to receive necessary medications that would not be available to them if they were discharged. Patients attend weekly follow up visits in the OPAT clinic.

Challenges

A key challenge for this indigent population has been lack of access to post-acute services. That has created a backlog for Parkland in discharging patients who still require post-acute services such as home health, to administer medications. This backlog has created a domino effect for Parkland. Because these patients have no post-acute services available, they remain in the hospital (to insure they receive medications) which then constrains availability of inpatient beds for patients held in the ED or observation units, all of which compounds the problem of providing appropriate care to patients in an appropriate setting. While Parkland alone cannot resolve the post-acute system constraints, project 127295703.2.5 has been submitted to review options for post-acute care that may lessen the burden for patients with no current access to such services.

Another key challenge has been that the OPAT program expanded faster than anticipated and is now at capacity with 5 times the demand of current volumes. With expansion of the OPAT program including increasing staff and space, more patients could be enrolled in the program.

5-Year Expected Outcome for Provider and Patients

The five year goals for the project include:

- Increased volume of patients who could be discharged from the hospital sooner
- Reduced average length of stay for those who can be enrolled in the OPAT program

- Reduced number of 30-day readmissions for OPAT patients
- Reduced site of insertion infection rates
- Reduced cost for medications

Starting Point/Baseline

In FY2012, the OPAT clinic monitored 353 patients once a week for 6-8 weeks. The FY2011 baseline for readmissions of OPAT patients was 65%.

Rationale

The OPAT program, specific to Parkland's indigent population is the first program of its kind in the United States. While this intervention has been cited by several studies (in the U.S., Canada, Ireland, etc.), the patient populations served have been insured and/or relatively small in comparison. As Parkland's program continues to expand with improved outcomes, it will set the national standard for this type of program for patients with no financial means and access to care after discharge.

OPAT programs are evolving while research has been done to prove it can be a safe and feasible strategy. Oxford Ratcliffe Hospitals performed a retrospective review of its OPAT program over 13 years. This review of 2,000 patients determined that this program not only can decrease hospital costs and increase patient satisfaction, but is safe and practical when clinical teams supervise eligible patients to self-administer their medications at home.[369]

Prior to Parkland's OPAT clinic's existence, patients discharged on Outpatient Antibiotic Therapy were followed in various settings, and had frequent emergency room (ER) visits and readmissions related to their therapy. This clinic has also decreased the inpatient days anywhere from 21 to 35 days (average of 28 days) accrued from inpatients only needing IV antibiotics. At an average daily cost of $2,267 for a patient at Parkland, this program provides an average cost savings of $63,476 per patient and with the current volume of 353 patients, that's a cost savings of approximately $22,407,028.

Parkland also intends to standardize care throughout the continuum of patient experience from admission, education to patient, to transition of care from inpatient to OPAT clinic and home health care as applicable, which is currently nonexistent. Research validates that patients that come to the OPAT clinic have better outcomes than even those that are contracted through different home health agencies in the community. This can lend itself to sharing of best practices in learning collaboratives with post-acute providers and medical home providers. This project aligns well with other Parkland projects including those of performance and process improvements, care transitions, patient navigation, and implementing a cost system to determine benefits of post-acute alternatives.

[369] Oxford Ratcliffe Hospitals NHS Trust, et al. "Outpatient Parenteral Antimicrobial Therapy (OPAT): Is it Safe for Selected Patients to Self-Administer at Home? A Retrospective Analysis of a Large Cohort over 13 Years." Oxford University Press on behalf of the British Society for Antimicrobial Chemotherarpy. May 17, 2007.

Project Components

There are no required components of Project Option 2.8.4 - Implement an innovative and evidence based intervention that will lead to reductions in 30-day readmissions for providers that have demonstrated need/unsatisfactory performance in this area. However, though not required, we intend to meet several components under Project Option 2.8.1:

- Provide training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture. *Staff education and training are essential to insure patients are appropriately trained to self-manage their medication administration at home. OPAT program leaders are developing educational tools and expanding the training/education for clinicians. Educational tools and materials will also be developed for patients to take home to assist them during their treatment.*
- Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis, and dissemination of performance on these measures (i.e. weekly or monthly dashboard). *Data collection, analysis and dissemination of performance are currently available and safety, quality and efficiency performance measures are reported.*
- Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement. *Process maps, models, protocols are being implemented.*
- Implement software to integrate workflows & provide real-time performance feedback. *Parkland is undertaking many initiatives to improve data systems in the clinics*
- Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the results of key performance indicators. *The impact of the program is regularly monitored and appropriate changes are made as information and results warrant.*

In addition to the above, the continuous quality improvement milestone [P-15] to participate in face-to-face learning twice per year with providers and RHP to promote collaborative learning around shared or similar projects will be implemented. The program leadership has been very receptive to sharing outcomes and program information with other providers.

Milestones and Metrics

- P-3: Compare & analyze clinical/quality data and identify at least one area for improvement
    - P-X: Analysis and identification of areas for improvement
- P-X1: Engage stakeholders, identify resources and potential partnerships and develop intervention plan (including implementation, evaluation and sustainability)
    - P-X1.1: Submission of business plan and related documentation

- P-8: Train/educate providers/ staff in process improvement
    - P-8.1: Number of providers/ staff trained/ educated
    - P-8.2: Number of trainings held
- P-12: Report findings and learnings
    - P-12.1: Final report summary
- P-15: Participate in face-to-face learning twice/year with providers and RHP to promote collaborative learning around shared or similar projects
    - P-13.1: Participate in semi-annual face-to-face meeting/seminar
- I-13: Progress toward target/goal
    - I-Y.1: Number or percent of cases that meet target/goal
- I-16: Improve quality/efficiency using innovative project option
    - I-16.2: Improved 30-day readmissions rate for patients sent home with PICC line

Unique Community Need Identification Numbers the Project Addresses

- *CN.11 – Patient Safety and Quality*
- *CN.12 – ED Utilization and Readmissions*

How the Project significantly enhances an existing delivery system reform initiative

The OPAT program expansion significantly reduces average length of stay, decreases infection rates and decreases readmission rates and ED visits as evidenced by the initial decrease in 2010-2011 and currently trending down. Eligible patients can be discharged weeks earlier and trained to self-administer medications at home with appropriate follow up. Such a substantial reduction in the length of stay (averaging 28 inpatient days per patient) has benefits for the patient as well as for the hospital, which are addressed above.

The project has no related activities funded by U.S. Department of Health & Human Services.

Related Category 3 Outcome Measure(s)

OD-3: Potentially Preventable Readmissions

- IT-3.12: Other – 30-day Readmission Rate: Number of readmissions for patients 18+ years and older for any cause from index admission when discharged with PICC line to self-administer medications

When patients are discharged with a PICC line, the opportunity of improving their outcomes and/or reducing their length of stay is only viable if they are not readmitted due to a health issue related to self-management of their medications.

Relationship to Other Projects

Each project submitted by Parkland addresses a component of the continuum of care and are all aligned to balance the continuum so not to place undue burden on one site of care within the health system. This project addresses improvements in the hospital (decreased LOS) and in the post-acute care setting (discharging to an appropriate level of care).

Specifically, the clinical outcome for this project, 30-day readmission rate, is also being addressed in the following projects:

127295703.1.4	Implement chronic care patient registry*
127295703.1.10	Enhance performance improvement and reporting capacity
127295703.2.4	Expand chronic care model*
127295703.2.7	Implement patient navigation program
127295703.2.9	Implement care transitions program

**More than 68% of OPAT patients are diabetic, and the project for expanding the chronic care management model is targeting diabetic patients.*

Category 4 Related Outcomes

- RD-2: Potentially Preventable Readmissions
- RD-5: Emergency Department

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

There are no related projects being submitted through the RHP 9 plan since this is an innovative program specific to Parkland's patient population as indigent patients with no means for post-discharge care. However, the physician leader for this program is already sharing information and is submitting a paper for publication regarding the program's success.

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV - Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Parkland adopted the RHP 9 global method for project valuation supplemented by comparisons with like projects within and outside the region. Each project was evaluated with respect to its transformational impact, population served, project size and complexity, alignment with the

community needs, cost avoidance impact, sustainability and partnership collaboration. This project had a weighted average score of 8.15 on a 9.0 scale. Influencing factors include:

- Transformational impact for patient care for the indigent population
- Patient education for self-management of care
- Opportunity for increased bed capacity for other patients waiting
- Avoidable costs of delaying discharge for patients who only require medications that could administered post-discharge

According to Dr. Kavita Bhavan (Clinical lead for the OPAT program) eligible OPAT patients can be trained to self-administer their medications at home can be discharged on average 28 days sooner. Based on the decreased ALOS, the OPAT program has the opportunity to expand to 600-650 patients which could potentially save the hospital $41,259,400 (average cost of $2267 per day x average days saved 28 x 650 patients).

Project Option 2.6.2 – Establish Self-Management Programs and Wellness Using Evidenced-Based Designs – Faith Community Health/Nursing Program

Unique Project ID: 020908201.2.2
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Dallas/020908201

Provider: Texas Health Presbyterian Hospital Dallas, part of the Texas Health Resource system, serves a 621.5 square mile area and a population of approximately 2,054,356 people.

Intervention(s): This project will partner with faith communities in the service area to design self-management wellness programs using evidence-based practices.

Need for the project: This program has limited funding and staff. We need more nurses and Faith Community Health Workers to reach a greater number of patients.

Target population: The target population is individuals in the community that may not have access to primary care, are unlikely to seek primary care, and suffer from high blood pressure or diabetes that is unmanaged.

Category 1 expected patient benefits: This project seeks to provide care in a non-traditional setting that will engage the community in taking charge of their healthcare.

Category 3 outcomes: IT-1.7 our goal is to increase the number of people 18-75 years old with controlled high blood pressure by 15%

IT-1.11 our goal is to increase the number of people 18-75 years old with diabetes (type 1 and type 2) with controlled blood pressure by 15%.

Project Description

Our Faith Community Health/Nursing (FCH/N) program will partner with faith communities (congregations) in the Texas Health Presbyterian Hospital of Dallas service area to design self-management wellness programs using evidenced-based practices. The FCH/N program will train nurses (Faith Community Nurses) and lay workers (Faith Community Health Workers) to create supportive environments that encourages congregants to take an active role in managing their chronic conditions.

Currently, there are no hospitals in our region establishing an evidenced-based self-management program that promotes health and wellness. This program is designed to improve the health of the whole person (body, mind and spirit) and is a much needed program for RHP-9 thus affecting access to health care services and chronic condition management needs of this population.

The FCH/N program will consist of a Program Director of Faith Community Health, A Faith Community Nursing Coordinator and Lay Health Educators. Faith Community Nurses and Faith Community Health Workers will be trained to implement culturally and linguistically appropriate evidenced-based self-management programs, health education classes, and support groups within their congregational setting. The International Parish Nurse Resource Center Curriculum will be utilized for training FCNs. A curriculum developed in house will be utilized for training FCHWs. Initially, a congregational health needs assessment will identify the top 5 priorities. The Henry Ford Macomb Hospitals' FCN/Health Ministry Reporting and Documentation Tool will track project progress. This tool demonstrates evidence of the importance of utilizing FCNs and FCHWs in the congregational setting[370] and allows for the reporting of community benefit activities.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

The goal of this project is to develop and implement an innovative self-management FCH/N program with a particular focus on controlling high blood pressure among congregants with and without diabetes. Faith Community Nurses and Faith Community Health workers will help to create a supportive environment for congregants to learn how to self-manage their disease. They may also assist in connecting congregants to resources within the community.

Utilizing the Faith Community Nursing model, our goals are to:

(1) Promote health and wellness,
(2) Create or expand on an environment within the congregational setting to educate, share and discuss health and wellness and
(3) To improve health outcomes of the people in the faith communities living with chronic disease.

A major goal of the region is to reduce chronic disease and emergency department usage and readmissions. Education and controlled self-management of chronic disease will decrease the need to utilize emergency services for primary care.

Challenges

Approximately 33% of the US population and Texas has high blood pressure[371] and approximately 50% of this cohort controls their high blood pressure[372]. One of the Healthy

[370] Brown, AR., Giacona, M., Stockwell MA. Faith community nursing demonstrates good stewardship of community benefit dollars through cost savings and cost avoidance. Family & Community Health. 2009; 32(4): 330-338.
[371] Centers for Disease Control and Prevention (2012). Hypertension. Retrieved from: http://www.cdc.gov/nchs/fastats/hyprtens.htm

People 2020 objectives is to increase the proportion of adults who have their high blood pressure under control[373]. Another goal of Healthy People 2020 is to increase the proportion of the population with diagnosed diabetes whose blood pressure is under control[374]. In Texas, 67% of adults with diabetes have high blood pressure[375] and according to the Health indicators Warehouse approximately 51% of patients with diabetes[376] have controlled high blood pressure. The evidenced-based self-management wellness program will be made available to all members of the congregation; however, it will benefit low-income, Medicaid and uninsured populations. Faith Communities are made up of different races and ethnicities, ages, genders, uninsured, insured, Medicaid and low-income people. A systematic review of published literature suggested that health programs in faith-based organizations were determined to be effective[377]. These culturally and linguistically appropriate programs will be delivered utilizing the FCHW and the FCN within the congregational setting.

5-Year Expected Outcome for Provider and Patients

Our five-year goal is to increase the participation rate from 11 to at least 40 congregations that develop Faith Community Health/Nursing and establish evidenced-based self-management wellness programs.

Starting Point/Baseline

As of 2009, the FCH/N program at THD trained approximately 12 FCNs who served in 7 different faith communities within the service area. Faith Community Nurses implemented programs such as blood pressure screenings, hand hygiene education, CPR training, etc. Unfortunately, due to the lack of resources and support, evidenced-based self-management programs were not able to be implemented. In 2012, a Program Director of Faith Community Health was hired to help launch a pilot program, "Faith Community Health," in collaboration with Faith Community Nursing to improve the health of the people within the congregational setting. This new pilot program was launched in September 2012 and has since trained over 15 Faith Community Health Workers from 7 different Faith Communities. Currently, we are in partnership with 11 congregations that vary in size. In total, these congregations make up approximately 25,000 people. We plan to roll this model out to more congregations in Dallas County.

The FCH/N was selected to enhance access and care delivery infrastructure by extending the continuum of care model. The "Continuum of Care" can best be understood by the stages of care provided to an individual. These stages are pre-acute (i.e., wellness and prevention) acute care (i.e., hospital setting); post-acute care (i.e., manage health improvement). The FCH/N program will expand the delivery of care by engaging physicians, nurses and healthcare professionals to provide health education and health screenings in the faith communities.

Project Components

There are no core requirements

Unique community need identification numbers the project addresses

- CN.8: Chronic Disease
- CN.11: Emergency Department Usage and Readmissions

How the project significantly enhances an existing delivery system reform initiative

As a hospital THD provides patient care services but this initiative will provide health prevention and promotion services within the community. We have not received any federal funding for this program.

Related Category 3 Outcome Measures and Rationale

- IT – 1.7 Controlling High Blood Pressure (stand – alone)
  By the end of the waiver, our goal is to increase the number of people 18 – 75 years old with controlled high blood pressure (<140/90 mm Hg) by 15%. In DY2, we will establish the baseline for this rate.

- IT – 1.11 Diabetes care: BP control (<140/80 mm Hg)
  By the end of the waiver, our goal is increase the number of people 18 – 75 years old with diabetes (type 1 and type 2) with controlled blood pressure (<140/80 mm Hg) by 15%.

Reasons/rationale for selecting the outcome measures:

(This validated, evidence-based rationale is for outcome 1 & 2)
Assuming Texas health status to approximate the national average of people who have high blood pressure, then it can be estimated that 33% of people in Texas have hypertension[378]. More specifically, Dallas county patients who came to the ER with chest pain as a diagnosis,

[378] Centers for Disease Control and Prevention (2012). Hypertension. Retrieved from: http://www.cdc.gov/nchs/fastats/hyprtens.htm

21% to 25% had a comorbidity of diabetes[379]. Lorig and colleagues (1999) showed evidence that chronic disease self-management program can improve health behaviors and health status, while also reducing hospitalizations and days of hospitalization[380].

Relationship to other Projects

This project is related to the Continuing Care Clinic ((020908201.1.1). The goal of the project is to reduce admissions and lower the overall cost of healthcare to the individual and system. These projects will work in tandem with each other to provide access to care unfunded patients.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

Children's Medical Center is also submitting a project related to health promotion programs (138910807.2.2).

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable use to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology: For every participant, $1,200 in cost is saved by the healthcare system[381]. Healthcare costs are calculated by multiplying $1,200 by the total individuals affected.

Rationale/Justification: Outcome improvement targets are dependent on the target population served (e.g. # of participants) and size.

Project Option -2.1.2 Collaborate with an affiliated Patient-Centered Medical Home to integrate care management and coordination for shared, high-risk patients

Unique Project ID: 020908201.2.3 (Pass 2)
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Dallas/020908201

Project Description

Healing Hands Ministries is a grassroots, volunteer-driven community based organization that provides medical and dental care to patients in Dallas County. The clinic is a beacon of hope providing reliable, efficient, low-cost medical and dental care to the needy – in a nurturing, welcoming environment. Texas Health Resources, Texas Health Presbyterian Hospital Dallas (THD), and Texas Health Physician Group fostered a relationship with Healing Hands through Dallas County Medical Society's Project Access Dallas (PAD). Dallas County Medical Society determined in December 2012 to discontinue Project Access Dallas, this project will provide care for those patients previously cared for through PAD who utilized THD's services and patients Healing Hands cares for that were not previously enrolled in PAD.

This project will build upon the existing resources and relationships THD has with Healing Hands and will focus on connecting patients to care by creating a coordinated defined process of referral from THD to Healing Hands. Healing Hands will become the primary care "home" for the referred patients. It is important for these patients to be assigned to a "home" with a health care team who provides services based on a patient's unique health needs, effectively coordinates the patient's care across inpatient and outpatient settings and proactively provides preventive, primary, routine and chronic care. Also, the plan creates financial incentives and opportunities for collaboration between THD and Healing Hands to provide care to a "cohort" of uninsured/underinsured residents in a performing provider service area that would otherwise not have access to quality care and improved health outcomes.

Collaboration

This project is being proposed through a collaboration agreement as set forth below.

Collaborators	DY2	DY3	DY4	DY5	Total
Texas Health Presbyterian Hospital Denton	436,706	502,853	534,560	578,352	2,052,471
Texas Health Presbyterian Hospital Kaufman	314,984	362,694	385,564	417,150	1,480,392
Parkland Memorial Hospital	1,496,906	1,746,438	1,842,667	1,961,679	7,047,690
Total Through Collaboration	**2,248,596**	**2,611,985**	**2,762,791**	**2,957,181**	**10,580,553**

Project / Collaboration	DY2	DY3	DY4	DY5	Total
Category 2 Project Value	2,767,898	2,679,921	2,826,514	2,282,278	10,556,611
Related Category 3 Projects Value	358,198	566,180	605,682	1,448,368	2,978,428
Total Project Value	**3,126,096**	**3,246,101**	**3,432,196**	**3,730,646**	**13,535,039**

The collaboration involves the transfer of Pass 2 allocated dollars from two intra-system hospitals to the Texas Health Presbyterian Dallas Hospital. This funding is supplemented by the transfer of Pass 2 allocation from Parkland Memorial Hospital (public entity) to the performing provider (private entity). The combined project value for this project exceeds the funding provided by the collaborating entities.

Pooling the Pass 2 allocation provided sufficient funds to support this larger project to be performed by Texas Health Presbyterian Hospital Dallas. All parties join together in this collaboration with the belief that the goals of this project are valuable and will contribute to regional transformation.

Goals and Relationship to Regional Goal

A major goal of the region is to provide improved access to coordinated primary and specialty care. This project would contribute to achieving that goal by implementing a collaborative across multiple performing providers committed to identifying eligible uninsured residents' access to a patient centered medical home.

The five year goal of Healing Hands Ministries and Texas Health Dallas are:

- Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients; direct referral process for assured connection to care.
- Evaluate the success of the intervention by decreasing ED and inpatient hospitalization by shared, high-risk patients and use this data in rapid-cycle improvement to improve the intervention.
- Improve data exchange between Texas Health Dallas and Healing Hands Ministries
- Develop actionable health information analytical capability for reporting provider performance, patient risk stratification and population management, leverage the intellectual property of providers in achieving qualitative and quantitative improvement in care the uninsured working poor.

Challenges/Issues:

Providing access to this high risk population has many challenges. This population experiences numerous barriers such as learning literacy issues, language barriers, affording medications, keeping appointment when they are not connected to a medical home. Cultural issues can make changing behaviors difficult. This project aims to expand access to this population by expanding THD's relationship with Healing Hands to increase access to care as a designated medical home to this high risk patient population. This measure creates efficiency and reduces the cost of providing care to this population by implementing strategies to assure this population is connected to care. Options for the uninsured to access coordinated and comprehensive health care are limited. The project aims to provide patients with additional high quality services that are culturally sensitive while proving accountable and measurable outcomes which will propagate an improvement of their health care experience. The major challenge we face is determining the patient's referral source when they present to the Emergency Department or are admitted to the hospital. A formal referral process will be created with a unique patient identifier that will make tracking this vulnerable population easier for Texas Health Presbyterian and Healing Hands.

Starting Baseline

Healing Hands Ministries (HHM) and THD currently care for a population of about 968 patients. THD will work with Healing Hands to care for these patients. THD will provide diagnostic and lab services, outpatient, and inpatient services as needed.

Rationale

As indicated in the Dallas Fort Worth Hospital Council's RHP 9 Community Needs Assessment, there is a strong demand for primary and specialty care services. The demand for hospital, primary care and specialty care services exceeds the supply of available medical physicians in the hospital's service area, thus limiting health care access for low level management or specialized treatment for prevalent health conditions. Many primary care physicians accept a limited number of the Medicaid/Uninsured population due to the lack of coordination of care and access to appropriate ancillary services. Consequently, many residents seek primary care treatment in emergency care settings resulting in increased healthcare costs and higher volumes of preventable and avoidable cases populating emergency department waiting rooms. Thus, improved/continued support to physicians, Healing Hands Ministries and Texas Health Dallas through the exchange of information, coordination of services can have a significant impact on the uninsured ability to access care and improve outcomes.

Project Core Components

A. Improve data exchange between hospitals and affiliated medical home sites.

B. Develop best practices plan to eliminate gaps in the readiness assessment.

C. Hire and train team members to create multidisciplinary teams including social workers, health coaches, care managers, and nurses with a diverse skill set that can meet the needs of the shared, high-risk patients

D. Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients

E. Evaluate the success of the intervention at decreasing ED and inpatient hospitalization by shared, high-risk patients and use this data in rapid-cycle improvement to improve the intervention.

F. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Reason for selecting milestones/metrics

Our milestones measure an increased population receiving care through a direct referral to a medical home model of care: (1) we are establishing and implementing medical home assignment criteria, (2) we are determining the appropriate panel size for primary care provider teams, potentially based on staff capacity, demographics, and diseases. (3) we are increasing the number of eligible patients assigned to a medical home, (4) we are increasing the number of new patients assigned to medical homes that are connected to a medical visit within 60 – 120 days and (5) we are documenting medical home recognition/accreditation of community/charity clinic by a nationally recognized agency (e.g. NCQA). This demonstrates a means to provide quality care while be held to a recognized standard. (6) we are providing access to patients that otherwise would not have the ability to receive care while managing complex high risk health issues with a more coordinated approach utilizing the skills of a multidisciplinary team. These relationships demonstrate the ability to positively impact high risk patient health outcomes.

Community Needs Assessment Identification Number

- CN.3 Healthcare Capacity
- CN.8 Chronic Disease

Describe how the project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is new for Texas Health Dallas and improves the relationship between the hospital and Healing Hands Ministries through a continued agreement to care for uninsured patients and improve access to primary and specialty care.

Related Category 3 Outcome Measures

IT- 11.5 All-Cause Admission Rate for Chronically-Ill patients. This measure will demonstrate the importance of assigning low income uninsured residents to a medical home. By doing so, this will decrease the admission rate for chronically ill (diagnosis of Diabetes, CHF, Hypertension, COPD, or Asthma) Healing Hands patients post enrollment.

Relationship to other Projects

This project is related to the Continuing Care Clinic project (020908201.1.1.2) and the Faith Community Nursing/Health Worker Project (020908201.2.6). Both of these projects goals are to reduce admissions and lower the overall cost of healthcare to the individual and system. These projects will work in tandem with each other to provide access to patients.

Relationship to Other Performing Providers Projects in the Region

This project is not directly related to any other project in the region with a 2.1.2 category.

Project Valuation

Approach/Methodology: For every inpatient readmission avoided, $7,724 in cost is saved by the healthcare system[382]. Healthcare costs are calculated by multiplying $7,724 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

Rationale/Justification: Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g. aging populations will have increased admissions due to higher incidence rates), size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g. keeping lower acuity patients under observation instead of admitting them). Outcome improvement targets are dependent on the target population served (e.g. the number of new enrollees each year).

[382] Based on the average avoided inpatient admission cost for Diabetes, CHF, Hypertension, COPD, or Asthma, and assumes a cost-to-revenue of 30%. Texas Department of State Health Services.

Project Option 2.9.1 - Establish/Expand a Patient Care Navigation Program

Unique Project ID: 020967801.2.1
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Denton/020967801

Provider: Texas Health Presbyterian Hospital Denton is a 255 bed acute care hospital located in Denton, Texas. Our hospital serves the city of Denton and surrounding communities within a 1,173.3 square mile area and a population of approximately 270,898 people.

Intervention(s): This project will establish a patient care navigation program to identify patients who are at a high risk of disconnect from institutionalized health care and provide services to reduce episodic care. Services that may be provided include but not limited to primary care physician referrals or chronic disease management clinics/services, referrals to resources supporting a variety of socioeconomic needs, patient/family education, follow-up on compliance with referrals and health management plans, reassessment of needs, and others.

Need for the project: The volume of patients seen in the emergency department increased by 8.08% from 2010 to 2011 and an estimated increase of 12.8% expected in 2012. 49.61% of those patients currently utilizing our ED are either unfunded or Medicaid funded patients. A sub-set of these patients utilize the ED inappropriately for management of chronic disease states and/or with increased frequency for episodic care. A patient navigator, protocols, and increased access to primary care for patients should support care management in the right setting and improve overall management of health in this identified population.

Target population: The target population is patients, primarily those without funding or are underfunded, who inappropriately visit the Emergency Department for episodic care, are frequent users of the ED, and/or are those with chronic conditions where assistance with coordination of care could avoid the need for ED visits or hospitalizations. By DY3, at least 100 unique patients are targeted for enrollment in navigation services. Over the course of the waiver period, we anticipate being able to intervene with patients identified frequently utilizing the ED for non-emergent or chronic care evidenced by greater than three (3) visits per year or are identified at risk for fragmented care to reduce avoidable ED visits. (DY4: 550 avoided ED visits in identified population; DY5: 1160 avoided ED visits in identified population).

Category 1 expected patient benefits: This project seeks to reduce ED utilization and provide services to patients who may be unaware of resources available to them. ED RN navigator will navigate patients to primary care and other resources supporting improved care management and improved health. Milestones selected initially include identification of specific patients targeted for navigation and the development of the ED RN navigation program to include hiring, training and providing ongoing education for the ED RN navigators. Other milestones include development of processes supporting enrollment, scheduling, resource referrals, patient tracking, reporting on patients enrolled and other key interventions. Tracking outcomes

of the program including primary care physician referrals for patients without a medical home and a reduction in avoidable patient use of the ED would be monitored.

Category 3 outcomes: IT-9.2 our goal is to reduce ED utilization by 18% in identified population by the end of the waiver period (DY4: 550 avoided ED visits; DY5 1160 avoided ED visits).

Project Description

This project will implement an ED-based nurse navigator program to identify patients who are at high risk of disconnect from institutionalized health care including but not limited to the uninsured or underinsured, frequent users of the ED and/or at high risk for use of the ED for episodic care, and those with chronic conditions where assistance with coordination of care could avoid the need for ED visits or hospitalizations and assist them in more effective and appropriate utilization of health care resources. The ED-based nurse navigator will work with patients and a multidisciplinary healthcare team to:

- Navigate patients to obtain necessary community resources to meet identified patient needs
- Connect patients to primary and preventive care by assisting patients to obtain a PCP and/or enrollment in a chronic disease management clinic to more effectively manage their disease on an ongoing basis
- Intervene as necessary to provide education, assist in coordination of care and monitor identified patients post discharge to encourage compliance with follow-up plan for receiving ongoing care/support for their healthcare needs.
- Facilitate arrangements for care, as appropriate, at a lower level, such as a medical home, outpatient clinic or skilled facility to avoid hospital admission and reduce risk of ongoing utilization of ED for non-emergent care needs.
- Conduct quality improvement for project using methods such as PDSA, rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, "lessons learned", opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations.

Goals and Relationship to Regional Goals

The goals for the program include enrollment of 100 unique patients in the patient navigation program and reduction of their ED utilization, participation in two semi-annual face-to-face meetings or seminars organized by the RHP and increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services by 20% by DY4 and 25% by DY5.

Challenges

While ED costs are expected to outpace reimbursement by $6.8 billion by 2019 (Bamezai, Melnick, Nawathe, 2005) the heaviest financial burden will be those with chronic conditions that account for an estimated $0.85 of every dollar spent on healthcare. The case manager must also address the issues of lack of education, chronic disease and poor primary care access for low-income and uninsured residents in Region 9.

5-Year Expected Outcome for Provider and Patients

The five year goal of the project is to demonstrate improved appropriate utilization of the ED and a reduction in ED visits for the following conditions:

- Congestive Heart Failure
- Diabetes
- End Stage Renal Disease
- Cardiovascular Disease/Hypertension
- Behavioral Health/Substance Abuse
- Chronic Obstructive Pulmonary Disease
- Asthma

Starting Point/Baseline

Utilization of the Texas Health Presbyterian Hospital Denton's Emergency Department has been steadily increasing over the last several years with an 8.08% increase in ED patient volume between 2010 (35050 visits) and 2011 (37833 visits). Estimates for 2012 (42734 visits) indicate an additional 12.8% increase in volume will be noted from 2011 to 2012. 49.61% of the patients currently utilizing our ED are unfunded or Medicaid funded patients increasing from 46.89% in 2010, many of whom routinely use the ED for management of their chronic condition or episodic care. Baseline data regarding an active relationship with a PCP for this population is not known at this time. Opportunities are evident that assistance is needed for patients at risk for receiving fragmented care. Frequent users of the ED for episodic care are comprised of a variety of diagnoses aligned with those identified throughout Denton County discussed earlier. DY 2 will identify at risk patients in our setting and determine types of services and resources needed in this population.

Rationale

The utilization of the Texas Health Presbyterian Hospital Denton's emergency department has been steadily increasing over the last several years as demonstrated by a growth in patient visits from 2010 through 2012 estimated at 21.9% with an increasingly growing unfunded and Medicaid population (up 5.5%). A 24.2% overall growth in Denton County population is expected by 2015 with the Hispanic population comprising 24.9% and all other non-Anglo constituents comprising another 10.8%. It is anticipated that this program provides patients utilizing the ED for non-emergent care or repetitive chronic care needs with a culturally competent ED-based nurse navigator to help connect them to appropriate resources and consistent clinical care. Utilization of the emergency department for management of chronic disease or for episodic care results in higher health care costs and less effective management of

chronic health conditions or disease prevention. Through the implementation of this program, the ED nurse navigator can connect the patients without an established PCP to a healthcare provider, assist in coordination of service amongst specialties, connect the patient to appropriate community resources (financial, transportation, child care, medication support, translation/interpretation services, etc.), provide necessary education for improved self-management skills and assist patients in complying with follow-up care to improve their health and prevent utilization of more costly resources (such as the emergency department or hospital)[383]. Additionally, this specific role can learn from others or share lessons learned with others in the learning collaborative related to this state-wide initiative to improve related outcomes.

Project Components

2.9.1 - Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (for example, patients with multiple chronic conditions, cognitive impairments and disabilities, Limited English Proficient patients, recent immigrants, the uninsured, those with low health literacy, frequent visitors to the ED, and others)

Required core project components:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
c) Connect patients to primary and preventive care.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Unique community need identification numbers the project addresses

- CN.1: Demographics
- CN.8: Chronic Disease
- CN.10: Patient Safety and Quality
- CN.11: ED Usage and Readmissions

[383] Romania, M. The Benefits of an Emergency Department Case Management Program, *The Pennsylvania Nurse*. September 2006 15:33.

Related Category 3 Outcome Measures

IT-9.2 ED appropriate utilization (Stand-alone measure)

Reduce Emergency Visits for target conditions:

- Congestive Heart Failure
- Diabetes
- End Stage Renal Disease
- Cardiovascular Disease/Hypertension
- Behavioral Health/Substance Abuse
- Chronic Obstructive Pulmonary Disease
- Asthma

Implementation of this project should assist in getting the patient the care they require in the right setting for that care, avoiding unnecessary emergency department visits and reduce admissions through improved outpatient management of chronic conditions Studies have demonstrated the effectiveness of establishment with a PCP and case management/navigation program to improve management of patient health and reduce risk of avoidable readmissions.[384]Nurse Navigators assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health to achieve these goals. Providing key information, support and follow-up for self-management strategies actively engages the patient in driving his/her health outcomes.

Relationship to Other Projects

This project is related to 020967801.2.2.1 Expand Chronic Care Management Models. The ED RN navigator/case manager will utilize the chronic care models as a resource to refer patients needing assistance with management of their chronic conditions.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaboratives

Texas Health Kaufman proposed related projects and would be invited to participate in a learning collaborative. Members of the team involved in leading the project would participate in the RHP-wide learning collaborative at least twice a year. Through participation in the collaborative, it is hoped that we would learn how to make our program more effective and to develop partnerships within the collaborative to improve efficiencies and patient outcomes.

In addition, several other performing providers in RHP9 have related projects for expanding or establishing patient care navigation programs (2.9.1):

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable use to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology: For every ED visit avoided, $421 in cost is saved by the healthcare system.[385] The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

Rationale/Justification: ED visit outcome improvement targets are dependent on the target population served (e.g. the number of frequent flyers, patients with greater than three visits in a year), size (e.g. if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

Community benefits were calculated using the following factors: lost productivity (net of lost wages), lost in payroll taxes, and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

[385] Based on 2011 historical ED visits data for Texas Health Presbyterian Denton

Project Option 2.2.1 – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases

Unique Project ID: 020967801.2.2
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Denton/020967801

Provider: Texas Health Presbyterian Hospital Denton serves a 1,173.3 square mile area and a population of approximately 270,898 people.

Intervention(s): This project will provide the under serviced who suffer from chronic diabetes and provide them with education and management tools to help them understand their daily regimen and need for monitoring their disease process. In turn, this will reduce the number of 30-day readmissions.

Need for the project: A model to coordinate and prescribe care. A Certified Diabetes Educator, pharmacist, physicians, care navigator, nurses, nutritionist, and a case manager to help coach and patients using the Wagner Chronic Care Model.

Target population: The target population is chronic diabetes patients in need of education and disease management services with A1C>9, history of DKA, > one admission in the last 12 months as criteria. More specifically, DY 2 will begin hiring staff (certified diabetes educator) and providing training on the Wagner Chronic Care Model; DY3 will include formalizing multi-disciplinary teams, pursuant to the Chronic Care Model and identify as well as screen/test 260 patients; DY 4 will include a 10 percent increase of the patients identified/screened to a total of 286; and DY 5 will include a five (5) percent increase of patients identified/screened to a grand total of 300 patients. Again, THDN will focus on the Wagner Chronic Care Model to educate them and help those patients establish self-management goals.

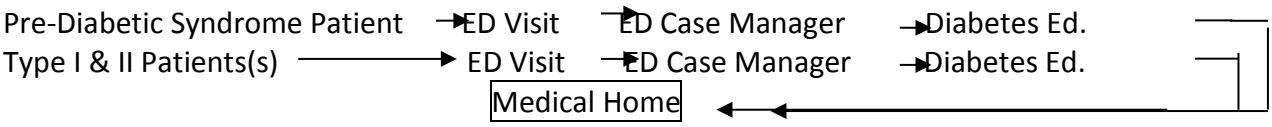
Category 1 expected patient benefits: This project seeks to assist the under served who are need of education, self management tools for managing chronically ill diabetes patients and reduce the number of 30-day readmissions.

Category 3 outcomes: IT-1.10 our goal is to decrease the number of diabetic clinic patients whose HbA1C is >9.0% by 15% to a total of 300 patients by DY5.

Project Description
There is not a consistent method for identifying diabetes patients at THDN, which has resulted in a variability of care for the underserved. Some of these patients have not been effectively educated on how to manage their diabetes and/or understand their daily regimen and the need for monitoring their disease process. The gap has created a lack of understanding for their long-term goals, which impact their quality of life.

Our proposed intervention will help individuals who are traditionally underserved and give them access to the diabetes care they need. This proposed program is designed to provide chronic diabetes patients with education and management to help them understand their daily regimen and need for monitoring their disease process. It will also create care models and coordinate prescribed care. The program staff will consist of non-physician health professionals such as a certified diabetes educator, registered dietitians, pharmacists, nurses, care navigator, case management/social workers. Physicians will be a key part of the team to provide clinical care and medication adjustments and prescriptions. Patients will be identified by: first, partnering with primary care clinicians to utilize protocols: A1C>9, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education. Second, the ED case management and inpatient diabetes educator will identify patients with the same criteria as above, help identify a patient centered medical home for diabetics that have not received diabetes education ever or within the last five years, and provide education for others as needed and within the community. This program will not only help provide better care to the underserved through medical management skills, but it will also reduce the number of number 30-day Readmission Rate.

ED Algorithm



Goals and Relationship to Regional Goals:

The goal is to have a multi-disciplinary care team tailored to provide continuing medical care and ongoing patient self-management education. This concept will support the prevention of acute complications and reduce the risk of long-term (complications) associated with diabetes.

Diabetes care is complex. There are many issues beyond glycemic control that need to be addressed when supporting a diabetic care regimen. Standards of care are needed for patients diagnosed with diabetes. In turn, diabetics will use multidisciplinary protocols developed by our team of experts. Patients will receive diabetes care, general treatment goals, and tools to evaluate their disease process.

Our proposed intervention will help individuals who are traditionally under served and give them access to diabetes education and self management skills, so they can better manage their diabetes. Our proposed delivery system includes the use of navigation services; hiring staff; and training staff in DY 2. The lead clinician will be a Certified Diabetes Educator that will work pharmacists, physicians, nurses, patient navigator, physicians, nutritionists and a case manager/social work to help assist with education, management services and navigate to a medical home. The physicians will be a key part of the team to provide clinical care, medication adjustments and prescriptions.

A major goal throughout the North Texas region is provide education on access, prevention and management to the underserved who suffer from diabetes. This project would contribute toward achieving that goal by improving the level of education for chronic care diabetes patients in Denton County who are underserved that are in need of diabetes education, training, and clinical interventions. This program will not only help provide better care to the underserved through medical management skills, but it will also reduce the number of number 30-day Readmission Rate.

Challenges

Denton County is one of the fastest-growing counties in the U.S. As of the 2010 census, its population was 662,614, which is a 41.4% increase in population between the years 2000-2007. The demographics of the county was 75% White, 8.4% Black or African American, 0.7% Native American, 6.6% Asian, 0.1% Pacific Islander, and 2.9% from two or more races. 18.2% of the population was of Hispanic or Latino origin.

According to the US Department of Health and Human Services 2007 Report the Denton County population consists of 4.6% diabetics, 23.3% obese, 17.3% high blood pressure, 16.2% use tobacco, 22.2% do not exercise and 80.1% consume few fruits and vegetables. The THDN ED has experienced significant growth over the last three years.

YTD as of 9/2012 ER Visits = 32,132		
Medicaid & Mg'ed Medicaid	6,935	21.6%
Self Pay	9,173	28.6%
2011 – ER Visits = 37,883		
Medicaid & Mg'ed Medicaid	8,412	22.2%
Self Pay	9,625	25.4%
2010 – ER Visits – 35,050		
Medicaid & Mg'ed Medicaid	7,465	21.3%
Self Pay	8,970	25.6%

5-Year Expected Outcome for Provider and Patients

We anticipate a decrease in ED usage as a clinic; a decrease of readmissions for chronic diabetes patients; and it will enable us to identify new diabetics and track their progress. First, the outcome is to reduce readmissions through the ED for diabetic patients by 15% from our baseline. Second, the outcome is to track and provide medical assistance for 300 diabetic patients.

Starting Point/Baseline

The starting point includes hiring a Certified Diabetes Educator to develop a delivery model to reach those in need of diabetes support. The Educator will identify medical homes by engaging stakeholders from local agencies, physician offices and nutritionists. As a whole they work collectively to develop and use care models and protocol for helping uninsured patients manage their diabetes. In conjunction, the Educator will identify needed resources; determine timelines; develop implementation plans and establish baseline rates. During the first phase the Educator will work with IT to develop and test data systems for tracking the patients over time as a method of monitoring their progress.

At the conclusion of the waiver period the expectation is to decrease ED usage and reduce readmissions of chronic diabetes patients by 10 percent.

Rationale

Currently our ED provides an exemplary level of care to a diverse medical population. In order to prevent diabetes complications, patients need an alternative toward using the ED for primary care. We have selected this project to reduce complications associated with diabetes, reduce ED visits and readmissions, improve quality of life for this diverse populous, and eventually help them experience a better quality of life. This project addresses the gaps in care for the diabetic population and improves their knowledge of the disease process. Our milestones and metrics will guide us during the development of our diabetes program. In doing so, our team will use the Wagner Chronic Care Model to guide diabetes management plans. Our process includes: (1) Establishing a multidisciplinary team including Physicians, Nurse Practitioners, Care Navigator, Diabetes Educators, Registered Dietitians, Clinical Social Workers, Registered Nurses, Pharmacists, and support staff. (2) Develop relationships with local agencies and physician offices to collectively develop and use care models for helping uninsured patients manage their diabetes. (3) Develop policies, procedures, and data collection tools to effectively run the coordinated program and monitor effectiveness, reducing fragmented care.

Project Components

The following core project components are included in this project: A) Design and implement a protocol that includes a multi-disciplinary team to help patients navigate the health care system. B) Ensure patients can access care teams by person, email or phone. C) Increase patient engagement through education, group visits, self-management support, improved patient-provider communication techniques, and coordination of community resources. D) Implement projects to empower patients to stay healthy and self-manage their diabetes. E) Conduct quality improvement for the project using methods such as rapid cycle improvement.

Unique community need identification numbers the project addresses

This project relates to project 020967801.2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who

might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Program for management of their disease.

- CN.1: Demographics Texas Health Presbyterian Hospital Denton/020967801.2.2
- CN.8: Chronic Disease Texas Health Presbyterian Hospital Denton/020967801.2.2
  Texas Health Presbyterian Hospital Denton/020967801.3.2
- CN.11: Emergency Department Usage and Readmissions Texas Health Presbyterian Denton/020967801.3.3

How the project represents a new initiative

This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures and Rationale

Stand Alone Measure: 1.10 Diabetes care: HbA1c poor control (>9.0%)

a. Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or 2) who had hemoglobin Ac (HbA1c) control> 9.0%

b. Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and 2)

Relationship to other Projects

This project relates to project 020967801.2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Program for management of their disease.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

The safety net performing providers within RHP 9 have related projects to expand their chronic care management models and incorporate interventions for specific chronic disease or implement a disease registry. The following projects were identified:

Performing Provider	Unique Project ID	Project Option
Baylor University Medical Center	139485012.2.2	Expand Chronic Care Management Model
Baylor Medical Center at Garland	121790303.2.2	Expand Chronic Care Management Model
Baylor Medical Center at Irving	121776204.2.2	Expand Chronic Care Management Model
Trinity Medical Center (Baylor-Carrollton)	195018001.2.1	Expand Chronic Care Management Model
Children's Medical Center	138910807.1.3	Implement pediatric disease registry
Denton County HHS	13660803.2.1	Implement disease registry – diabetes
Methodist Charlton Medical Center	126679303.2.1	Expand Chronic Care Management Model
Methodist Dallas Medical Center	135032405.2.1	Expand Chronic Care Management Model
Methodist Richardson Medical Center	209345201.2.1	Expand Chronic Care Model
UTSW – Faculty Practice Plan	126686802.2.2	Expand Chronic Care Management Model

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable use to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology: For every inpatient readmission avoided, $8297 in cost is saved by the healthcare system. Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

For every inpatient admission avoided, $8297 in cost is saved by the healthcare system.[386] Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

Rationale/Justification: Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g. aging populations will have increased admissions due to higher incidence rates), size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g. keeping lower acuity patients under observation instead of admitting them).

Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g. keeping lower acuity patients under observation instead of admitting them).

Community benefits were calculated using the following factors: lost productivity (net of lost wages), work absenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

[386] Based on 2011 historical inpatient diabetes admissions data for Texas Health Arlington Memorial

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program

Unique Project ID: 09410302.2.1
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Kaufman/09410302

Provider: Texas Health Presbyterian Hospital Kaufman serves an 800.9 square mile area and a population of approximately 107,250 people.

Intervention(s): This project will establish a patient care navigation program to identify patients who are at a high risk of disconnect from institutionalized health care and provide services to reduce episodic care.

Need for the project: A patient navigator, protocols, and increased access to primary care for patients.

Target population: The target population is patients that visit the Emergency Department for episodic care, frequent users of the ED, and those with chronic conditions where assistance with coordination of care could avoid the need for ED visits or hospitalizations.

Category 1 expected patient benefits: This project seeks to reduce ED utilization as a primary care resource and provide more appropriate services to patients who may be unaware of resources available to them. Over the course of the waiver, we anticipate being able to intervene with a minimum of 1000 patients (DY2: 100 patients; DY3: 150 patients; DY3: 200 patients; DY4: 250 patients; DY5: 300 patients)

Category 3 outcomes: IT-9.2 our goal is to reduce ED utilization of the target populations by 18%.

Project Description
This project will implement an ED-based nurse navigator program to identify patients who are at high risk of disconnect from institutionalized health care including but not limited to the uninsured or underinsured, frequent users of the ED and/or at high risk for use of the ED for episodic care, and those with chronic conditions where assistance with coordination of care could avoid the need for ED visits or hospitalizations and assist them in more effective and appropriate utilization of health care resources. The ED-based nurse navigator will work with patients and a multidisciplinary healthcare team to:

- Navigate patients to obtain necessary community resources to meet identified patient needs
- Connect patients to primary and preventive care by assisting patients to obtain a PCP and/or enrollment in a chronic disease management clinic to more effectively manage their disease on an ongoing basis

- Intervene as necessary to provide education, assist in coordination of care and monitor identified patients post discharge to encourage compliance with follow-up plan for receiving ongoing care/support for their healthcare needs.
- Facilitate arrangements for care, as appropriate, at a lower level, such as a medical home, outpatient clinic or skilled facility to avoid hospital admission and reduce risk of ongoing utilization of ED for non-emergent care needs.
- Conduct quality improvement for project using methods such as PDSA, rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, "lessons learned", opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations

Goals and Relationship to Regional Goals

The goals for the program include enrollment of 100 unique patients in the patient navigation program and reduction of their ED utilization, participation in two semi-annual face-to-face meetings or seminars organized by the RHP and increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services by 20%.

Challenges

While ED costs are expected to outpace reimbursement by $6.8 billion by 2019 (Bamezai, Melnick, Nawathe, 2005) the heaviest financial burden will be those with chronic conditions that account for an estimated $0.85 of every dollar spent on healthcare. The case manager must also address the issues of lack of education, chronic disease and poor primary care access for low-income and uninsured residents in Region 9.

5-Year Expected Outcome for Provider and Patients

The five year goal of the project is to demonstrate improved appropriate utilization of the ED and a reduction in ED visits for the following conditions:

- Congestive Heart Failure
- Diabetes
- End Stage Renal Disease
- Cardiovascular Disease/Hypertension
- Behavioral Health/Substance Abuse
- Chronic Obstructive Pulmonary Disease
- Asthma

Starting Point/Baseline

Utilization of the Texas Health Presbyterian Hospital Kaufman's Emergency Department has been steadily increasing over the last several years with an 8.77% increase in ED patient volume between 2010 (21,821 visits) and 2011 (23,918visits). Estimates for 2012 (26,391 visits) indicate

an additional 9.37% increase in volume will be noted from 2011 to 2012. 60.04% of the patients currently utilizing our ED are unfunded or Medicaid funded patients increasing from 59.02% in 2010, many of whom routinely use the ED for management of their chronic condition or episodic care. Baseline data regarding an active relationship with a PCP for this population is not known at this time. Opportunities are evident that assistance is needed for patients at risk for receiving fragmented care. Frequent users of the ED for episodic care are comprised of a variety of diagnoses aligned with those identified throughout Kaufman County. DY 2 we will identify at risk patients in our setting and determine types of services and resources needed in this population

Rationale

It is anticipated that this program patients utilizing the ED for non-emergent care or repetitive chronic care needs with a culturally competent ED-based nurse navigator to help connect them to appropriate resources and consistent clinical care. Utilization of the emergency department for management of chronic disease or for episodic care results in higher health care costs and less effective management of chronic health conditions or disease prevention. Through the implementation of this program, the ED nurse navigator can connect the patients without an established PCP to a healthcare provider, assist in coordination of service amongst specialties, connect the patient to appropriate community resources (financial, transportation, child care, medication support, translation/interpretation services, etc.), provide necessary education for improved self-management skills and assist patients in complying with follow-up care to improve their health and prevent utilization of more costly resources (such as the emergency department or hospital). Additionally, this specific role can learn from others or share lessons learned with others in the learning collaborative related to this state-wide initiative to improve related outcomes

Project components

2.9.1 Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (for example, patients with multiple chronic conditions, cognitive impairments and disabilities, Limited English Proficient patients, recent immigrants, the uninsured, those with low health literacy, frequent visitors to the ED, and others)

Required core project components:

a) identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
c) Connect patients to primary and preventive care.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.

e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations

Unique community need identification numbers the project addresses

- CN.1: Demographics
- CN.8: Chronic Disease
- CN.10: Patient Safety and Quality
- CN.11: ED Usage and Readmissions

Related Category 3 Outcome Measures

IT-9.2 ED appropriate utilization (Stand-alone measure)

Reduce Emergency Visits for target conditions:

- Congestive Heart Failure
- Diabetes
- End Stage Renal Disease
- Cardiovascular Disease/Hypertension
- Behavioral Health/Substance Abuse
- Chronic Obstructive Pulmonary Disease
- Asthma

Implementation of this project should assist in getting the patient the care they require in the right setting for that care, avoiding unnecessary emergency department visits and reduce admissions through improved outpatient management of chronic conditions Studies have demonstrated the effectiveness of establishment with a PCP and case management/navigation program to improve management of patient health and reduce risk of avoidable readmissions.[387]Nurse Navigators assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health to achieve these goals. Providing key information, support and follow-up for self-management strategies actively engages the patient in driving his/her health outcomes.

Project Option 2.2.1 – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases

Unique Project ID: 09410302.2.2
Performing Provider Name/TPI: Texas Health Presbyterian Hospital Kaufman/09410302

Provider: Texas Health Presbyterian Hospital Kaufman serves an 800.9 square mile area and a population of approximately 107,250 people.

Intervention(s): This project will provide chronic diabetes patients education and management to help them understand their daily regimen and need for monitoring their disease process. Need for the project: A model to coordinate and prescribe care. A Certified Diabetes Educator, pharmacist, physicians, nurses, nutritionist, and a case manager will help coach and navigate patients.

Target population: The target population is patients with A1C>9, history of DKA, > one admission in the last 12 months as criteria.

Category 1 expected patient benefits: This project seeks to manage chronically ill patients diagnosed with diabetes.

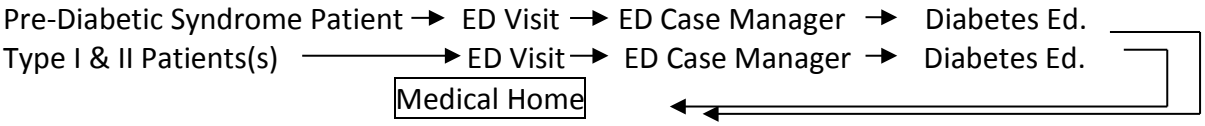
Category 3 outcomes: IT-1.10 our goal is to decrease the number of diabetic clinic patients whose HbA1C is >9.0% by 15%

Project Description

There is not a consistent method for identifying diabetes patients at THK, which has resulted in a variability of care for the underserved. Some of these patients have not been effectively educated on how to manage their diabetes and/or understand their daily regimen and the need for monitoring their disease process. The gap has created a lack of understanding for their long-term goals, which impact their quality of life.

This proposed program is designed to help those in need of education on diabetes management. It will also create care models and coordinate prescribed care. Patients will be identified by: first, partnering with primary care clinicians to utilize protocols: A1C>9, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education. Second, the ED case manager and inpatient diabetes educator will identify patients with the same criteria as above, help identify a patient centered medical home for diabetics that have not received diabetes education ever or within the last five years, and provide education for others as needed and within the community.

ED Algorithm



Goals and Relationship to Regional Goals

The goal is to have a multi-disciplinary care team tailored to provide continuing medical care and ongoing patient self-management education. This concept will support the prevention of acute complications and reduce the risk of long-term (complications) associated with diabetes.

Diabetes care is complex. There are many issues beyond glycemic control that need to be addressed when supporting a diabetic care regimen. Standards of care are needed for patients diagnosed with diabetes. In turn, diabetics will use multidisciplinary protocols developed by our team of experts. Patients will receive diabetes care, general treatment goals, and tools to evaluate their disease process.

Our proposed delivery system includes the use of a Certified Diabetes Educator, pharmacists, physicians, nurses, nutritionists and a case manager to help coach and navigate patients as needed for diabetic care.

A major goal throughout the North Texas region is provide education on access, prevention and management to the underserved who suffer from diabetes. This project would contribute toward achieving that goal by improving the level of education for chronic care diabetes patients in Kaufman County who are underserved that are in need of diabetes education, training, and clinical interventions.

Challenges

31% of people in Texas Health Kaufman's service area are uninsured, underinsured or insured by Medicaid. The number of patients in our ED and hospital with a primary diagnosis of diabetes is a small percentage of our diabetes management program. Rather, diabetes is a comorbidity for a greater number of our patients who have multiple chronic conditions. Therefore there needs to be a link from the ED and inpatient areas to outpatient resources and education to assist this population. A decrease in morbidity of diabetes will decrease the morbidity of other chronic conditions affected by diabetes including but not limited to CAD, PVD, stroke and renal disease.

The ED currently does not utilize a case manager or a diabetes educator to provide screening, care and/or directing diabetic patients toward a medical home. As patients are seen in the ED, there is also a lack of systems that address the secondary diagnosis's consistently. In turn, this inconsistency creates a variability of care. The proposed project addresses those challenges and provides a better standard of care.

5-Year Expected Outcome for Provider and Patients

We anticipate a decrease in ED usage as a clinic; a decrease of readmissions for chronic diabetes patients; and it will enable us to identify new diabetics and track their progress.

Starting Point/Baseline

The starting point includes hiring a Certified Diabetes Educator to develop a delivery model to reach those in need of diabetes support. The Educator will identify medical homes by engaging stakeholders from local agencies, physician offices and nutritionists. As a whole they work collectively to develop and use care models and protocol for helping uninsured patients manage their diabetes. In conjunction, the Educator will identify needed resources; determine timelines; develop implementation plans and establish baseline rates. During the first phase the Educator will work with IT to develop and test data systems for tracking the patients over time as a method of monitoring their progress.

At the conclusion of the waiver period the expectation is to decrease ED usage and reduce readmissions of chronic diabetes patients by 10 percent.

Rationale

Currently our ED provides an exemplary level of care to a diverse medical population. In order to prevent diabetes complications, patients need an alternative toward using the ED for primary care. We have selected this project to reduce complications associated with diabetes, reduce ED visits and readmissions, improve quality of life for this diverse populous, and eventually help them experience a better quality of life. This project addresses the gaps in care for the diabetic population and improves their knowledge of the disease process. Our milestones and metrics will guide us during the development of our diabetes program. In doing so, our team will use the Wagner Chronic Care Model to guide diabetes management plans. Our process includes: (1) Establishing a multidisciplinary team including Physicians, Nurse Practitioners, Diabetes Educators, Registered Dietitians, Clinical Social Workers, Registered Nurses, Pharmacists, and support staff. (2) Develop relationships with local agencies and physician offices to collectively develop and use care models for helping uninsured patients manage their diabetes. (3) Develop policies, procedures, and data collection tools to effectively run the coordinated program and monitor effectiveness, reducing fragmented care.

Project Components

The following core project components are included in this project: A) Design and implement a protocol that includes a multi-disciplinary team to help patients navigate the health care system. B) Ensure patients can access care teams by person, email or phone. C) Increase patient engagement through education, group visits, self-management support, improved patient-provider communication techniques, and coordination of community resources. D) Implement projects to empower patients to stay healthy and self-manage their diabetes. E) Conduct quality improvement for the project using methods such as rapid cycle improvement.

Unique community need identification numbers the project addresses:

- CN.1: Demographics
- CN.8: Chronic Disease
- CN.11: Emergency Department Usage and Readmissions

How the project represents a new initiative

This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures and Rationale:

IT-1.10: 1.10 Diabetes care: HbA1c poor control (>9.0%)

a. Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or 2) who had hemoglobin Ac (HbA1c) control> 9.0%
b. Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and 2)

IT-3.3: Diabetes 30 day readmission rate

a. Numerator: number of readmissions (for patients 18 years and older), for any cause, within 300 days of discharge from the index diabetes admission. If an index admission has more than 1 readmission, only first is counted as a readmission.
b. Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of diabetes and with a complete claims history for the 12 months prior to admission.

Relationship to other Projects

This project relates to project 09410302.2.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Program for management of their disease.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

The safety net performing providers within RHP 9 have related projects to expand their chronic care management models and incorporate interventions for specific chronic disease or implement a disease registry. The following projects were identified:

Performing Provider	Unique Project ID	Project Option
Baylor University Medical Center	139485012.2.2	Expand Chronic Care Management Model
Baylor Medical Center at Garland	121790303.2.2	Expand Chronic Care Management Model

Baylor Medical Center at Irving	121776204.2.2	Expand Chronic Care Management Model
Trinity Medical Center (Baylor-Carrollton)	195018001.2.1	Expand Chronic Care Management Model
Children's Medical Center	138910807.1.3	Implement pediatric disease registry
Denton County HHS	13660803.2.1	Implement disease registry – diabetes
Methodist Charlton Medical Center	126679303.2.1	Expand Chronic Care Management Model
Methodist Dallas Medical Center	135032405.2.1	Expand Chronic Care Management Model
Methodist Richardson Medical Center	209345201.2.1	Expand Chronic Care Model
UTSW – Faculty Practice Plan	126686802.2.2	Expand Chronic Care Management Model

Texas Health Denton will also participate in this project and will be invited to participate in a learning collaborative. Members of the teams involved in leading similar chronic disease management projects would participate in the RHP-wide learning collaborative at least twice a year. Through participation in the collaborative, it is hoped that we would learn how to make our program more effective and to develop partnerships within the collaborative to improve efficiencies and patient outcomes.

We plan to play an active role in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Approach/Methodology: For every inpatient admission avoided, $8297 in cost is saved by the healthcare system.[389] Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs.

For every inpatient admission avoided, $8297 in cost is saved by the healthcare system.[390] Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

Rationale/Justification: Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that

[389] Based on 2011 historical inpatient diabetes admissions data for Texas Health Arlington Memorial
[390] Based on 2011 historical inpatient diabetes admissions data for Texas Health Arlington Memorial

already prevent avoidable inpatient admissions (e.g. keeping lower acuity patients under observation instead of admitting them).

Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g. keeping lower acuity patients under observation instead of admitting them).

Community benefits were calculated using the following factors: lost productivity (net of lost wages), work preseentism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using the following factors: lost wages, caretaker expense and extension of life (if applicable).

Project Option 2.1.1 – Expanding the Medical Home Model in the UTSCAP Primary Care Network

Unique Project ID*:* 126686802.2.1
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center Faculty Practice Plan/126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, 24% of UTSW patient charges were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will expand the medical home model in the UTSCAP Network to enhance the delivery of primary care to our patients.

Need for the Project: The expansion of the UTSCAP Network to community physicians must also incorporate changes in how we care for patients. In order to improve the health of our Region and decompress the pressures on our Region's safety-net hospitals, we must implement a model of care that best serves our patients' primary care and preventive care needs.

Target Population: The target population for this project is all the UTSCAP Network patients (our patients) using primary care services. Approximately 3% of our patients are either Medicaid eligible or indigent, so we expect 3% of our medical home enrollees to be Medicaid eligible or indigent.

Category 1 or 2 Expected Patient Benefits: By DY5, the project aims to have increased the number of UTSCAP Network clinics using the medical home model by 10% and the number of medical home patients contacted for preventive services identified as necessary by 15% from the determined baseline. To benefit RHP 9 patients, UTSW intends to expand access to primary care resources and improve practice operations through this medical home initiative. Educating ER patients about the importance of primary care and empaneling patients with a PCMH inspired primary care provider can have a significant impact to RHP 9 patients. Thus, our expectation is that this program will have a substantial impact on a wide variety of patients in RHP 9. UTSW anticipates adding 126 primary care physicians to the Network. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could benefit from this PCMH project. By implementing PCMH principles, these practices will directly impact the population for improved access, quality, and lower costs.

Category 3 Outcome Measures:

- IT-12.1 Breast Cancer Screening—Our goal is to increase the number of women aged 40 to 69 that have received an annual mammogram by X% (TBD) above the DY2 baseline.

- IT-12.3 Colorectal Cancer Screening—Out goal is to increase the number of adults aged 50 to 75 that have received colorectal cancer screening by X% (TBD) above the DY2 baseline.

- IT-12.4 Pneumonia Vaccination Status of Older Adults, age 65 and older—Out goal is to increase the number of patients who are older adults receiving a pneumonia vaccination by X% (TBD) over the DY2 baseline.

Project Description

UT Southwestern proposes to enhance the delivery of care provided through the Patient-Centered Medical Home (PCMH) model in the UTSCAP Primary Care Network.

This project, *Expanding the Medical Home Model in the UTSCAP Primary Care Network*, will provide support, resources and expertise in the patient centered medical home ("PCMH") model for affiliated community-based primary care physicians and practices to implement this model in their private practice. One of the key characteristics of the PCMH model is the rigorous measurement and ongoing quality analysis required to prove that appropriate care is being provided, thus reducing avoidable costs and improving patient outcomes.

The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term goals for the Network include:

- Expanding, strengthening and implementing a clinically integrated network;
- Developing an infrastructure for effective care coordination of Network patients;
- Enhancing and continually developing a clinically integrated organizational structure in preparation of health care reform and value-based reimbursement; and
- Advancing the use of technology to improve health care and reduce medical errors.

As the Network grows through the membership of community-based primary care physicians, this project will develop, implement and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

- Use evidence-based training materials for medical homes based upon model change concepts;
- Train medical home personnel on PCMH change concepts;
- Implement the medical home model in the Network's primary care clinics; and
- Provide population health management by identifying and reaching out to Network patients who need to be brought in for preventive service and ongoing coordinated care.

A major goal of the region is to provide improved access to coordinated primary and specialty care. This project would contribute to achieving that goal by implementing the principles of the PCMH model in an integrated primary care Network—the UTSCAP Network. In addition, emergency department utilization is high in RHP 9 and by providing more patients with the coordinated care they need, when they need it, this project helps achieve the a regional goal to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges

The implementation of the PCMH model represents a substantial evolution for physicians and patients. It requires significant investment in process redesign, systems implementation, provider education, software integration, communication, and patient research to ensure understanding and engagement toward the goals. Community-based primary care practices have limited resources to enable them to redesign their practice around the PCMH model. This project will allow affiliated, community-based primary care practices (i.e. UTSCAP Network clinics) with tight budgets the education, tools and resources to implement the difficult changes required of their practice necessary to realize the value of this care model. These transitions will be a significant challenge that can be met through this focused, planned invention for success. UT Southwestern will deploy resources to newly affiliated practices to assess the practices current processes, perform a gap analysis of where they are relative to PCMH standards, and provide an action plan of how to progress towards implementing PCMH principles.

5-Year Expected Outcome for Provider and Patients

The 5-year expected outcome for Network patients is improvement in increased incidence of preventative services actually delivered to patients and an improvement in quality metrics. The 5-year expected outcome for UT Southwestern is a clinically integrated network of affiliated

physicians successfully practicing under the PCMH model for the delivery of quality, efficient care, in preparation for healthcare reform.

In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addtion, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to expand access to primary care resources and improve practice operations through this medical home initiative. Educating ER patients about the importance of primary care and empaneling patients with a PCMH inspired primary care provider can have a significant impact to RHP 9 patients. Thus, our expectation is that this program will have a substantial impact on a wide variety of patients in RHP 9. UTSW anticipates adding 126 primary care physicians to the Network. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could benefit from this PCMH project. By implementing PCMH principles, these practices will directly impact the population for improved access, quality, and lower costs.

Starting Point/Baseline

The starting point for this initiative is the level of PCMH clinic participation and implementation of the milestones and metrics described herein during the baseline period of October 1, 2010 – September 31, 2011. Currently, the UTSCAP Network contains one (1) primary care clinic that earned Level 3 recognition from the National Council for Quality Assurance (NCQA) PCMH Program in April 2011. This clinic is comprised of 32 primary care physicians. Thus, the baseline for this project is one (1) UTSCAP Network primary care clinic implementing the PCMH model of care delivery. Through the means described herein, UT Southwestern intends to expand implementation of PCMH in primary care practices materially over the baseline period.

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inadequate access to efficient, quality primary care services for the patients in RHP 9.

This expansion of a clinically integrated network of community primary care physicians and clinics and the faculty physician practice at UT Southwestern must also incorporate changes in how care is delivered to patients. The Patient Centered Medical Home ("PCMH") is viewed as a foundation for delivering care that results in improvements in patient outcomes and better

cost-effectiveness. This project significantly enhances UT Southwestern's PCMH initiative by working with affiliated, community-based primary care clinics to expand the implementation of this model in the Network and our Region. Finally, the ultimate, predicted outcomes of this project are improved health of our Region's patients and decompression on the Region's safety-net hospitals.

Project Components

UT Southwestern's goal to create an affiliation of primary care clinics utilizing the PCMH model for the delivery of preventive services, such as colon cancer and pneumonia vaccinations, will ultimately result in a healthier community and a reduction in community resources spent on avoidable healthcare costs. While that is the ultimate goal, one of the first steps towards that goal is the expansion of the PCMH model across the Network. Through this project, we propose to meet all the required core elements: (1) utilizing a gap analysis to assess the UTSCAP Network's primary care physicians' NCQA PCMH readiness, (2) conducting feasibility studies to determine necessary steps to achieve NCQA PCMH status, (3) conducting educational sessions for UTSCAP Network primary care physicians', primary care practice offices, the UTSW University Hospital medical staff and leadership on the elements of PCMH, its rationale and vision; and (4) conducting quality improvement for the project using the method of rapid cycle improvement to identify the project impacts, "lessons learned", and identifying key challenges associated with expansion and sustainability of the PCMH model in the UTSCAP Network.

Unique community need identification number the project addresses

As indicated in the RHP 9 Community Needs Assessment, the demand for primary and specialty care services exceeds that of available medical physicians, thus limiting access to healthcare services for chronic disease management or preventive services. The specific and unique community need identification numbers that this project addresses include the following:

- CN.2-Regional Healthcare Infrastructure and Patient Migration Patterns
- CN.3- Healthcare Capacity
- CN.4-Primary Care and Pediatrics
- CN.12-ED Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative

The project represents a significant enhancement to the delivery of care through the PCMH model. Currently, the UTSCAP Network contains only one (1) primary care clinic that earned Level 3 recognition from the National Council for Quality Assurance (NCQA) PCMH Program in April 2011. With the growth of the UTSCAP Primary Care Network, UT Southwestern will engage community-based primary care physicians to deliver care under the PCMH principles of care; and thus, expand these principles throughout our Region.

Related Category 3 Outcome Measures

OD-12 Primary Care and Primary Prevention Outcomes:

- IT-12.1 Breast Cancer Screening (HEDIS 2012)
- IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
- IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Reasons/rationale for selecting the outcome measures:

Our expansion of the PCMH model and principles in the UTSCAP Network is aimed at connecting patients to their health care team that can proactively provide preventive, primary, routine and chronic care. We selected the above outcomes because implementing the principles of the PCMH should result in the increased incidence of preventative services actually delivered to patients. We subscribe to the theory that screening programs should lead to a cost-effective reduction in disease burden. UT Southwestern will focus on this outcome for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects

The PCMH is the centerpiece for several planned UT Southwestern DSRIP projects. The PCMH is foundational to reaching our patient population in a low-cost setting while ensuring high quality, evidence-based care is delivered. The success of this initiative is highly dependent on the implementation of the following other projects proposed by UT Southwestern:

- ***126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics:*** This project improves access to primary care services by creating a robust Network of efficient, quality primary care physicians for RHP 9 patients. As community-based primary care physicians join the Network, they will no longer be practicing in "isolation".

- ***126686802.1.3—Implement a Quality Incentive Program for Network Primary Care Providers:*** UTSCAP Primary Care Network clinics will be able to participate in a quality incentive program. However, their ability to participate in this quality incentive program will be dependent upon their enrollment and participation in the Medicaid program, creating an environment whereby primary care physicians see all populations as a viable part of a broader patient population management program.

- ***126686802.1.4—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network

patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.4—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

Relationship to Other Performing Providers' Projects in the RHP: N/A

Plan for Learning Collaborative:

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

   This project's score for this criteria: 3.65 X 2 = **7.3**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

   This project's score for this criteria: 3.5 X 2 = **7**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 3.5 X 2 = **7**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 3.5 X 2 = **7**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 2.5 X 2 = **5**

Total Valuation Score for this project: **7**

These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option 2.8.1 – Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement
Project Title: Expand an existing, successful advanced training program in quality improvement methodology

Unique Project ID: 126686802.2.2
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center Faculty Practice Plan/126686802

Summary Information
Provider: The UT Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy Hospitals, and 40 clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 inpatients and oversee nearly 2 million outpatient visits/year. UTSW physicians provide a majority of at Parkland Hospital and Children's Medical Center. As a result, the UTSW Faculty Practice Plan is one of the largest Medicaid providers for in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UTSW outpatient practices.

Intervention(s): This project will expand an existing, successful advanced quality/process improvement training program in quality improvement methodology.

Need for the Project: The expansion of our advanced training program will allow healthcare providers from outside of UT Southwestern, students/trainees of UT Southwestern, and UT Southwestern affiliated institutions to participate in these training program, which will produce PI Events/Projects that will product significant cost savings and/or cost avoidance.

Target Population: The target population includes the clinical staff at 3 Performing Providers, including UT Southwestern Medical Center, Parkland Hospital, and Children's Medical Center, who treat patients (including our patients). By improving the quality improvement skills of the target population, they can in turn improve the care provided and the outcomes that come from the improvements.

Category 1 or 2 Expected Patient Benefits: Increase the number of physicians and clinical staff trained each year from 100 to 150. By DY5, the project seeks to have increased the number of Process Improvement Champions from 5/year to 20/Year. Increase the number of PI Projects conducted each year by 10% over the baseline established in DY2, increasing the potential for cost savings and cost avoidance each year. Create a method to measure cost savings from PI Events/Projects to reinforce the value of the training and PI project outcomes. It is estimated that the value of PI projects will be at least $4 -$8 million per year by DY5. PI Champions are defined as graduates from the program involved in future projects as facilitators. The patients affected by this project will be all patients seen at the 3 institutions. Any quality improvement

project done by any of the participants in this course including the Category 3 projects will affect patients in multiple areas, improving outcomes and lowering costs.

Category 3 Outcome Measures:

- IT-1.10 Diabetes Care: HbA1C—Our goal is to decrease the number of patients with diabetes who had a HbA1c greater than 9.0% by X% (TBD) over the DY2 baseline.

- IT-3.1 All cause 30 day readmission rate—Our goal is to reduce the 30 day potentially preventable all-cause readmission rate by X% (TBD) over the DY2 baseline.

Project Description

UT Southwestern proposes to expand an existing, successful advanced training program in quality improvement methodology.

UT Southwestern currently has a program that provides advanced training in this methodology to physicians and staff of its University Hospitals and Clinics, Parkland Health and Hospital System and Children's Medical Center at Dallas, i.e. the Southwestern Medical District.

This project will have two parts. First, UT Southwestern will expand the capacity of its current **Clinical Safety & Effectiveness Course** to provide advanced training in the methodology of Continuous Quality Improvement (CQI). The eligibility to take this Course will be expanded to include providers outside UT Southwestern and within the UTSCAP Network, medical and allied health students, and residents/fellows of training programs from UT Southwestern Affiliated Institutions. Second, a methodology to accurately evaluate the effectiveness and outcomes of this type of advanced training will be developed. Currently, the effectiveness of this program is measured by the number of projects completed by participants, the estimated avoidable costs savings by each project and the number of participants. A more advanced methodology of tracking and evaluating the quality of projects done by participants during the program course and after graduation is needed and will be developed.

The curriculum of the training program is comprehensive and includes the following areas:

(1) After completing the course, each participant will understand and be able to discuss:

- Case for continuous quality improvement
- Definition of clinical quality and who defines it?
- Voice of the Customer (VOC) and quality lessons from industry
- Current state of medical quality in the United States and UT Southwestern
- Use of PDCA and DMAIC as process improvement tools
- Team composition, management and dynamics
- Aim statement, project charter, scope and timeline
- Critical to quality tree, prioritization matrices and Kano's model
- Paradigm Shifts, Change Management, and Change Acceleration Process
- Equitable medical care and public health policy
- Process mapping and SIPOC
- Lean management tools
- Root cause analysis
- Data types and collection
- The use of HIT to evaluate and improve clinical care

(2) After completing the course, each participant will understand and be able to use the following quality improvement tools:

- Check list

- Histogram
- Pareto chart
- Fishbone diagram
- Root Cause Analysis
- Scatter plot
- Run chart
- SPC or control chart
- FMEA

(3) After completing the course, each participant will understand the following concepts:

- Central tendency, standard deviation, process capability
- Confidence and probability
- Common and special cause variation
- Distribution and sampling
- Correlation and causation

(4) After completing the course, each participant will be able to develop, perform and report a quality improvement project using the PDCA Cycle.

The project will have other components that meet the project requirements. Participating hospitals and systems will work with the project leaders to be sure the following elements are part of their performance improvement programs:

a) Develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.
b) Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis and dissemination of performance on these measures (i.e. weekly or monthly dashboard).
c) Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement.
d) Implement software to integrate workflows and provide real-time performance feedback.
e) Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the result of key performance indicators.

The target patient population is the population of patients cared for by the 3 Health Systems of the UT Southwestern Campus. This includes UT Southwestern University Hospitals, Parkland

Health and Hospital System and Children's Medical Center. The Course will be offered to the faculty of UT Southwestern which provides care at all of these hospitals and the staff of all of the participating hospitals. Currently the Course is offered to these institutions and the expansion of the project will include all three institutions and systems. The patients affected by this project will be all patients seen at these institutions since the faculty provide care there. The faculty provided care to 274,489 charity and Medicaid visits from December 2010 and November 2011 and the entire population should benefit from this course.
The project will not be funded through a collaboration agreement.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals
The long-term, primary goal of this project is to train and education clinical and administrative staff on process improvement strategies, methodologies, and culture so that clinical outcomes and efficiencies will improve. The project goals are as follows:

- Expand the capacity of its current **Clinical Safety & Effectiveness Course** to provide advanced training in the methodology of Continuous Quality Improvement (CQI);

- Develop a methodology to accurately evaluate the effectiveness and outcomes of this type of advanced training

A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments and reduce unnecessary readmission rates. This project will contribute to that goal by providing RHP 9 providers with the tools needed to provide quality care that is safe and efficient.

Challenges
Expanding the current system poses several immediate challenges. First, the cost of training providers is significant. Each participant in the training program completes 7 full days of didactic and participation sessions spread over 5 month period and a quality improvement project that is presented on the 8th day of the course. In addition, each participant receives 8 quality improvement textbooks. Finally several nation speakers who are experts in quality improvement methodology and leadership present to each class. Second, the time commitment by each participant is much more than the 8 days of didactic work. Each has to complete an outside quality improvement project that is relevant to their area of expertise. Finally, expanding the program to include providers outside of the UT system will present special challenges such as data sharing and marketing of the program.

To address these challenges and create a successfully expanded program, UT Southwestern will create a marketing strategy to attract participants from the rest of Region 9, targeting Parkland

Health and Hospital District, Children's Medical Center and Texas health Resources. We will continue to furnish current materials to these participants and the same curriculum and faculty

5-Year Expected Outcome for Provider and Patients

Increase the number of physicians and clinical staff trained each year from 100 to 150. By DY5, the project seeks to have increased the number of Process Improvement Champions from 5/year to 20/Year. Increase the number of PI Projects conducted each year by 10% over the baseline established in DY2, increasing the potential for cost savings and cost avoidance each year. Create a method to measure cost savings from PI Events/Projects to reinforce the value of the training and PI project outcomes. It is estimated that the value of PI projects will be at least $4 -$8 million per year by DY5. PI Champions are defined as graduates from the program involved in future projects as facilitators. The patients affected by this project will be all patients seen at the 3 institutions. Any quality improvement project done by any of the participants in this course including the Category 3 projects will affect patients in multiple areas, improving outcomes and lowering costs.

Starting Point/Baseline

The current program trains about 100 participants per year. This program was started 2.5 years ago and to date has trained over 250 faculty and staff, including more than 50 physicians. These trainees have done more than 50 quality improvement projects with several million dollars of estimated avoidable costs due to providing safer and more efficient care. These savings could be multiplied if this program were expanded to reach more providers and staff both inside and outside the UT Southwestern campus.

Rationale

Healthcare in the United States is expensive and the quality of the care delivered is in need of re-engineering to become a safer and more efficient system. One method of improving the quality of care delivered by providers is to educate members of the health care team in the methodology of process improvement. UT Southwestern has a long history in the education of future care providers; thus, this project of training providers in the methods and culture of quality improvement directly supports our mission of teaching.

Project Components

This project is related to the regional goals of the RHP in that quality improvement is considered a critical component of most of the projects in the regional plan. This project will provide advanced training in the methodology of quality improvement, including PDCA, and rapid cycle improvement. This project is scalable to provide education to all members of the regional plan who desire advance training in the methodology of Quality Improvement.

Specify the unique community need identification number the project addresses:

- CN.11 Patient Safety and Quality
- CN.12 Emergency Department Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative:

This project, although not new to UT Southwestern, significantly enhances the UT Southwestern's and RHP 9's ability to create a cultural change within the region towards quality improvement.

Related Category 3 Outcome Measures:

Patients in multiple systems with any diseases affected by projects of graduates for this program will benefit. However, we have chosen the below conditions due to their high risk and prevalence and high cost impact on the health care system as illustrations of the benefits seen by patients from the graduates of this program.

OD-1 Primary Care and Chronic Disease Management:

- IT-1.10 Diabetes care: HbA1c poor control (>9.0%)

OD-3 Potentially preventable Re-Admissions- 30 day Readmission Rates

- IT-3.1 All cause 30 day readmission rate

Reasons/rationale for selecting the outcome measures

We selected a standalone measure from the domain of potentially preventable re-admission rates, because this is one of the clinical outcomes measures that should be impacted by the refinement and expansion our project resulting in improved lives of our patients and reducing unnecessary health care costs. In addition, we selected a standalone measure to access the control of diabetes in our patients. Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. Thus, we selected diabetes care as an additional outcome measure because of the prevalence of diabetes in our region.

UT Southwestern will be focusing on these outcomes for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference towards transforming the delivery of care in our region and make a difference in the lives of individuals in our community and in RHP 9 at all income levels.

Relationship to other Projects

Quality improvement is a fundamental component of UT Southwestern's DSRIP projects and knowledge of the methodology of quality improvement is critical to the success of all of these projects:

- ***126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics & Affiliated, Community Primary Care Clinics:***

This project improves access to primary care services by creating a Network of primary care physicians. As community-based primary care physicians join the Network, they will no longer be practicing in "isolation". Through clinical integration with UT Southwestern, these community-based physicians will engage in the continual development and implementation of clinical "best practice" protocols.

- ***126686802.1.3—Implement a Quality Incentive Program for Network Primary Care Providers:*** UTSCAP Primary Care Network clinics will be able to participate in a quality incentive program. However, their ability to participate in this quality incentive program will be dependent upon their enrollment and participation in the Medicaid program.

- ***126686802.1.4—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.2.4—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

Relationship to Other Performing Providers' Projects and the Plan for Learning Collaborative

Parkland Health & Hospital System: 127295703.2.6
Denton Regional Medical Center: 111905902.2.1
Medical Center of Lewisville: 094192402.2.2
Medical City Dallas Hospital: 020943901.2.3

We plan to play active leadership and participant roles in the development and ongoing conduct of Project Learning Collaboratives, appropriate to our project, as organized by RHP 9 and described in Section IV – Stakeholder Engagement. We will also participate in any Outcomes Learning Collaborative that is associated with the outcomes of this project to obtain additional perspectives that may enable us to improve this project. We believe that the exchange of best practices and shared learning contributes significantly to continuous quality improvement and will advance the success of this project.

Project Valuation

Because the faculty of UT Southwestern provides care to patients in the UT Southwestern, Parkland Health and Hospital System and Children's Medical Center and all of the employees of

these systems are eligible to take this course, all of the patients in these systems, including the Medicaid and charity, will benefit. This includes 274,489 Medicaid and charity patient visits from Dec 2010 through November 2011 at these three institutions.

In addition, significant cost avoidance has already been demonstrated by graduates of this program. Since its beginning in 2010, over 50 quality improvement projects have been completed. Three of these projects alone accounted for more than $1.5M in cost avoidance at the UT Southwestern University Hospitals.

The Anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using those criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criteria: 4.5 X 2 = 9.0

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. This project's score for this criteria: 4.5 X 2 = 9.0

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. This project's score for this criteria: 4.5 X 2 = 9.0

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. This project's score for this criteria: 4.5 X 2 = 9.0

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. This project's score for this criteria: 4.5 X 2 = 9.0

6. Partnership collaboration (Weight 5%): 4.5 X 2 = 9.0

Total Valuation Score for this project: **9.0**

Project Option 2.5.1 - UT Southwestern Ambulatory Practice: Redesigning for cost containment

Unique Project ID: 126686802.2.3
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/ TPI 126686802

Summary Information
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s): This project will implement a cost accounting system that will provide reasonable, consistent and accepted costing of services in order to measure cost improvement or containment for the health care services we provide.

Need for the Project: In our ambulatory (faculty practice), we currently do not have a cost accounting system that allows us to address the real costs and their allocation for analysis.

Target Population: The target population for this project is all our patients. Approximately 3% of our patient clinic visits are either Medicaid eligible or indigent. Approximately 12,663 ED encounters are Medicaid and indigent, accounting for 45.9% of those encounters overall. Approximately 16,175 Medicaid patients visits were seen in UTSW outpatient clinics.

Category 1 or 2 Expected Patient Benefits: By DY5, we will have implemented a cost accounting system for our faculty practice, conducted a cost analysis and measured cost containment by re-measuring the healthcare costs of an intervention and comparing to the baseline in order to gauge improvements in cost.

Category 3 Outcome Measures:

OD-5 Redesign for Cost Containment
IT-5.1 Develop an integrated care model with outcome-based payments.

Project Description:

UT Southwestern proposes to implement a cost accounting system that will provide reasonable, consistent and accepted costing of services in order to measure cost improvement or containment for the health care services we provide.

The UT Southwestern Medical Service Research & Development Plan (UTSW-MSRDP) has struggled with cost accounting for years. Extremely limited resources and our continuing patient growth have required that we focus resources away from administrative areas to support clinical functions. Thus, UTSW-MSRDP has had to rely on basic cost to charge ratios that may work at a global (departmental) level but can provide very inaccurate or inconsistent results at a specific service or provider level due to variations in individual cost to charge comparisons. Consequently, providers, department managers and executives within the institution do not understand where the numbers come from and therefore place little faith in the resultant calculations. Finance and Planning staff have to make many assumptions and calculations in an attempt to address the real costs and their allocation for each analysis, creating inefficiencies and long turn-around times.

Studies have shown that access to primary care and chronic care management help reduce the need for high cost emergency care and hospitalizations (Starfield B, Shi L, Macinko J. Contribution of primary care to health systems and health. *Milbank Q.* 2005;83(3):457-502). Innovations that improve quality and integration add to cost management. We need the ability to accurately measure and monitor this improvement, and educate our providers of the cost impacts of the decisions they make. This requires investing in a system that will allow us to measure and monitor the impacts of our initiatives on the cost of healthcare.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationships to Regional Goals:

The project goals are as follows:

- Determine the best cost-accounting methodology to quantify the financial impact of quality and efficiency improvement interventions.
- Provide our finance staff with the necessary training to implement the selected cost-accounting methodology.
- Implement the cost-accounting methodology and related systems to measure intervention impacts.
- Engage in quality improvement activities for the project to ensure that the best possible project outcomes are achieved.
- Conduct a cost analysis for the majority of services we provide.

- Measure cost containment by re-measuring healthcare costs of an intervention and compare to baseline to gauge improvements in cost.

This project also meets the following regional goals:

Our region has a significant issue with capacity and access to primary care, specialty care and chronic disease management. One way of increasing these capacities to create efficiencies in the cost of care provided. As the system is more efficient in delivering care, the more care the system can deliver. A goal of RHP 9 is to provide quality, efficient, cost effective healthcare services to patients of RHP 9 at the right time, the right place and the right setting.

Challenges:

Analysis of physician outcome data, treatment data and cost data can inform the assessment of quality and efficiency for health episodes of care, which reflect all of the visits, procedures, testing and drugs used to treat a health "episode". UTSW anticipates spending a significant amount of time working with the selected Cost Accounting System vendor to try and accurately assign costs of care across all aspects of the health "episode". Given the complexity and variable nature of the provision of health care services, this process will be extremely challenging and will require significant effort and time investment by various departments across the UTSW organization.

5-Year expected outcomes for providers and patients:

The target population for this project is all our patients. Approximately 3% of our patient clinic visits are either Medicaid eligible or indigent. Approximately 12,663 ED encounters are Medicaid and indigent, accounting for 45.9% of those encounters overall. Approximately 16,175 Medicaid patients visits were seen in UTSW outpatient clinics. The ability for UT Southwestern to appropriately allocate resources to improve care resources and availability will greatly enhance access and results of the care provided at UT Southwestern facilities. Accurately tracking and assigning costs to specific service lines/clinics will allow us a greater understanding of the true underlying costs of care.

Starting Point/Baseline:

UTSW-MSRDP has had to rely on basic cost to charge ratios that may work at a global (departmental) level but can provide very inaccurate or inconsistent results at a specific service or provider level due to variations in individual cost to charge comparisons. Thus, the baseline for the activities required to complete this project are zero (0).

Rationale:

Pressures continue to be put on all our revenue sources from private payers, Medicaid, Medicare and State budgets, all of which negatively impact the resources available to meet patient demand. At the same time, the need for access to care continues to grow. The only way for institutions like UT Southwestern to meet these demands is to continue to become more efficient and effective at managing our finite resources. UTSW-MSRDP's mission is to build the necessary infrastructure and redesign to provide improved access, care management,

integration and quality. There is also an expectation that UTSW-MSRDP will also contain costs. To this end, we need to develop systems to measure and monitor our initiatives impact on costs. Therefore, the goal is to develop the capability to measure cost containment and apply that to projects or efforts so that the ability to measure the efficacy of initiatives is in place.

Project Components:

Through the Health Care Navigation Program, we propose to meet all the required project components:

(a) Implement a cost-accounting system to measure intervention impacts,

(b) Establish a method to measure cost containment,

(c) Establish a baseline for cost, and

(d) Measure cost containment.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

While hospitals are generally accustomed to having robust cost accounting systems, such systems have been lacking on the Physician Practice side. Consequently, we do not have a good understanding of the true cost of providing care. This effort to implement a new cost accounting system is to correct that situation by providing us a system specifically designed to provide accurate information about the true costs of providing care through a large Faculty based practice.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.3-Healthcare Capacity
- CN.4-Primary Care and Pediatrics
- CN.8- Specialty Care
- CN.9-Chronic Disease
- CN.11-Patient Safety and Quality

Related Category 3 Outcome Measure(s):

OD-5 Redesign for Cost Containment

IT-5.1 Develop an integrated care model with outcome-based payments.

Relationship to other Projects:
Accurately tracking and assigning costs to specific service lines/clinics will allow UT Southwestern to appropriately allocate resources to improve care resources and availability. Having a greater understanding of the true underlying costs of care will also allow us to more accurately assess the success of other expansion projects currently being proposed under Waiver proposal.

- 126686802.2.2.2—Applying process improvement methodology to improve quality and efficiency by training in the methodology of quality improvement
- 126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinic
- 126686802.2.1.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network
- 86802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development
- 126686802.2.9.1—Implement/Expand Care Coordination Programs
- 126686802.2.12.1—Expanding Care Transition Programs

Relationship to Other Performing Providers' Projects in the RHP: Parkland Health & Hospital System is the only other Performing Provider that has elected to conduct a Category 2.5 project. They have chosen Ouome Measure 2.5.2.

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region. UT Southwestern will participate in the Collaboratives as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:
The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following

exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

   This project's score for this criteria: 2 X 2 = **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

   This project's score for this criteria: 2 X 2 = **4**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

   This project's score for this criteria: 1.7 X 2 = **3.4**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

   This project's score for this criteria: 1.75 X 2 = **3.5**

6. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

   This project's score for this criteria: 3 X 2 = 6

Total Valuation Score for this project: **3.9**

Project Option 2.9.1 – Implement/Expand Care Coordination Programs

RHP Project Identification Number: 126686802.2.4
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center/TPI 126686802

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s):. This project will establish a health care navigation program in the UTSCAP Network comprised of care coordinators that provide support to patient populations who are most at risk of receiving disconnected and fragmented care.

Need for the Project: As we build the UTSCAP Network and actively recruit community-based primary care physicians and their practices into the Network, we must be to target those patients who are moderate to high risk patients, ensuring that these patients receive coordinated, timely and site-appropriate services. This is necessary to reduce our Region's high emergency department utilization and readmission rates.

Target Population: The target population is our UTSCAP Network patients (our patients) identified during DY2 as needing care coordination management services. Approximately 3% of our patients are either Mediciad eligible or indigent, so we expect at least 3% of our targeted patients receiving care coordination services to be Medicaid eligible or indigent patients.

Category 1 or 2 Expected Patient Benefits: In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addtion, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to implement a roubust care coordination program. By monitoring patient care gaps and intervening on a timely basis before they seek facility care, UTSW expects to have a significant impact to RHP 9 patients. UTSW anticipates adding 126 primary care physicians to the Network. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could benefit from this care coordination project each year. This program will generate a substantially amount of care coorindator patient contacts that will occur outside a typical care setting. We anticipate 1,100,000 overall and 177,000 Medicaid/low income primary care patient contacts per year in

DY5. Over the course of this project we expect this enhanced care coordination will reduce unnecessary utilization and redirect care that would otherwise be provided in higher cost settings.

The project seeks to increase the increase the number of new patients referred for services from the navigator program that are seen in a primary care setting and empanelled to a medical home by 10% in DY 5.

Category 3 Outcome Measures:

- IT-1.10 Diabetes Care: HgbA1C.

- IT-3.1 All cause 30 day readmission rate

Project Description

UT Southwestern proposes to establish a health care navigation program in the UTSCAP Network comprised of care coordinators that provide support to patient populations who are most at risk of receiving disconnected and fragmented care.

This Health Care Navigation Program will be implemented in the UTSCAP Network. The UTSCAP Primary Care Network (the "Network") is designed to integrate community-based primary care physicians and the faculty physicians of UT Southwestern Medical Center ("UT Southwestern"). The Network is in an early stage of development and growth and is actively recruiting community-based primary care physicians and their practices to join UT Southwestern faculty physicians. The ultimate goal of the Network is delivering patient care at the highest level of quality by the most cost-effective means, achieved through the clinical integration of Network physicians. Such outcomes are good for patients, payors, physicians and the community. The specific short and long-term objectives for the Network include:

- Expanding, strengthening and implementing a clinically integrated network;
- Developing an infrastructure for effective care coordination of Network patients;
- Enhancing and continually developing a clinically integrated organizational structure in preparation of health care reform and value-based reimbursement; and
- Advancing the use of technology to improve health care and reduce medical errors.

The care coordination program will consist of a teams of individuals. The program goals and scope of activities will be set by a physician medical director. The teams will interact directly within the program parameters with each primary care physician office. Each team will be lead by a nurse such as a RN or LVN with clinical experience in direct patient care. Additional members of the care coordination program will include medical assistants, social worker, clerical staff and community health workers. Each team will be assigned to help a number of primary care physician offices in geographic proximity. The nurse leading each team will meet regularly with the primary care physician and/or his office staff to ensure that the care coordination efforts are not being duplicated by the office staff and that the efforts are meshing well together and meeting the needs of network patients and the primary care physicians.

The care coordinator program from this Health Care Navigation Program will target Network patients who are moderate to high risk patients, ensuring that these patients receive coordinated, timely and site-appropriate health care services. The moderate and high risk patients will be identified by a variety of mechanisms. Some will be identified by the primary care physicians office as patients known to have high risk diseases, medical care compliance problems, or social barriers to care compliance. Other high risk patients will be identified by analysis of electronic health record data and payor claims data. The care coordinator program will assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations. In

addition, UT Southwestern will provide necessary training for all members of the care coordinator team so that these these team members will be able to guide patients in a culturally sensitive and linguistically appropriate manner through the Network. The goal of this Health Care Navigation Program is to address both chronic care management and the critical transition care components of a population management program focused on moderate to high risk Network patients.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationships to Regional Goals

The goal of this project is to utilize care coordinator teams as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of health care services.

- Create a Health Care Navigation Program of high quality, efficient, and cost effective care coordination resources;
- Identify and manage intensive and high-risk patients in close coordination with primary care offices;
- Use information technology resources to collect utilization and quality data on care coordinator assigned patient panels; and
- Leverage and extend physicians and other providers through the use of care coordinators that use data and expertise to assure patients are engaged the most cost effective, high quality care delivered to patients in the right place, at the right time, by the right provider.

A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments and reduce unnecessary readmission rates. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting.

Challenges

Historically, patients at UT Southwestern have been managed through appointment and follow-up medicine initiated by a material health event or complaint. Referral patterns would likely apply and the PCP would effectively turn over control of the patient periodically, sometimes to return and other times not. The patient would move as directed by the physician in charge at

the time and important integration and efficiency mechanisms would not be apply. In addition payors would not incentivize a centralization of responsibility or coordination of care.

UT Southwestern plans to overcome these challenges by complimenting the ACO/PCMH infrastructure of the UTSCAP Network with coordinate care activities to minimize duplicated services, provide steady assistance to Network patients throughout the care continuum, and eventual return the patient to their primary care physician. The care coordinators will directly connect with physicians and patients to ensure all parties are informed of and engaged in the patient's care plan and opportunities to avoid negative impacts to the patient's health status, including ED visits and relapse/readmission. This care coordination process will also focus on removing some of the unnecessary cost variability in patient care.

5-Year expected outcomes for providers and patients

The 5-year expected outcome for UT Southwestern and its Network is improved patient engagement through a "PCP hub" as well as improved cost and quality outcomes relative to the traditional model. Patients will be actively supported by a broader array of healthcare professionals and have a better understanding of their care plan. In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addtion, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to implement a roubust care coordination program. By monitoring patient care gaps and intervening on a timely basis before they seek facility care, UTSW expects to have a significant impact to RHP 9 patients. UTSW anticipates adding 126 primary care physicians to the Network. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could benefit from this care coordination project each year. This program will generate a substantially amount of care coordinator patient contacts that will occur outside a typical care setting. We anticipate 1,100,000 overall and 177,000 Medicaid/low income primary care patient contacts per year in DY5. Over the course of this project we expect this enhanced care coordination will reduce unnecessary utilization and redirect care that would otherwise be provided in higher cost settings. The expected outcomes for the Patient Navigation Program are to have:

- Identified frequent ED users and use of navigators as part of preventable ED reduction program.
- Trained health care navigators in cultural competency.
- Deployed innovative health care personnel such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connected patients to primary and preventative care.

- Increased access to care management and/or chronic care management, including education in chronic disease self-management.

- Decrease hospital readmission rates.

Starting Point/Baseline

During DY2 frequent ED users and other high risk Network patients will be identified based on a needs assessment to identify the patient population for which the program will be targeted. Patient navigation and care management will be provided to these patients. DY2 will serve as the baseline period for the project. Based on the number of patients served by the project, the number of providers trained to support the program will be identified and implemented

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes and wasted resources created by the fragmented, uncoordinated delivery of care.

Emergency Department utilization in North Texas exceeds national utilization rates resulting in higher costs for providing care to the region. The Community Health Needs Assessment points to a lack of accessing primary care sites and the inability to redirect patients to a more appropriate care setting. The patient navigator project will provide resources to help patients and their families better locate and navigate appropriate care locations.

UT Southwestern is looking to efficiently coordinate care throughout the Network and thereby, managing the many care and quality activities necessary to make meaningful progress in clinical outcomes and delivering care in the right setting at the right time. UT Southwestern will further its goal towards a highly-integrated model of care delivery by linking active care coordination capabilities to the UT Southwestern ACO/PCMH initiative. Direct interaction and engagement of all parties (care coordinators, community health workers, physicians, and patients) supports active management of health conditions and reduction in unnecessary hospital readmissions. This project is a highly effective way to help promote the continuity of care for all patients, including Medicaid patients.

Project components

Through the care coordination program, we propose to meet all the required project components.

a. *Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.*

   We will identify network patients using the emergency department for primary care services, patients without a designated PCP or medical home, and offer navigation services. Patient navigators or care coordinators will create social services notes in the EHR that will be associated with the patients' medical record by medical record number. These notes will include sections on reason for services, assessment, subsequent referrals and follow-up activities.

b. *Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.* Currently community health workers do not exist in our health care system. We propose creating and training such workers as part of our care coordination team. Candidates to be community health care workers will be individuals who live in a specific geographic region and have a good understanding of the neighborhood and the health care barriers that may be unique to that neighborhood. Candidates to be community health care workers could be students, retirees, and stay at home moms or dads. These workers would probably best work on a part time basis and would be trained by the nurse team leader or medical assistants to help with specific targeted areas of concern, medical management, or health care goal.

c. *Connect patients to primary and preventive care,*

   We will have regular contact with Network primary care physicians for care management services, preventive care, and other educational and social services. Network primary care physicians are automatically "enrolled" in the care coordination program. Network patients identified as benefiting from care coordination will be contacted with an introduction to our services. Care coordinators will be available to meet with providers to answer any specific questions. Due to our healthcare system's relative lack of primary care physicians, the care management program will be an important bridge until the patient can get established with a new primary care physician. The program can help expedite the establishment of a physician patient relationship with the primary care physician based upon medical priority. The nurses team leader can also assist in arranging age appropriate medical care that would fall within the scope of a nurse's abilities acting under standing orders established by the care coordination program medical director while patients are awaiting initial appointments with their new primary care physician.

d. *Increase access to care management and/or chronic care management, including education in chronic disease self-management, and*

e. *Conduct quality improvement for project using methods such as rapid cycle improvement.*

We will design a reporting template for the care coordinator notes that will include standardized fields where possible. We will create a data registry for enrolled patients to facilitate follow-up and effectiveness analysis. Reports will be run regularly and shared with ED staff and participating primary care providers. In addition, the UT Southwestern Quality Assurance Committee will review this data at its regular meetings and review for opportunities for program improvement and expansion.

Reasons/rationale for selecting the outcome measures

We selected a standalone measure from the domain of potentially preventable re-admission rates, because this is one of the clinical outcomes measures where we believe the impact of our project will be measureable and with improvement in the measure resulting in improved lives of our patients and reducing unnecessary health care costs. In addition, we selected a standalone measure to access the control of diabetes in our patients. Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. RHP 9 has similar opportunity to benefit from improvements in identifying and managing patients with this condition. While our goal of this project is to utilize a care coordinator program as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients, we selected diabetes care as our outcome measure because of the prevalence of diabetes in our region.

We subscribe to the theory that if you don't measure things you can't manage them. UT Southwestern will be focusing on these outcomes for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Specify the unique community need identification number the project addresses:

- CN.2- Regional Healthcare Infrastructure and Patient Migration Patterns
- CN.3-Healthcare Capacity
- CN.8-Specialty Care
- CN.9-Chronic Disease
- CN.11-Patient Safety and Quality
- CN13- Emergency Department Usage and Readmissions

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative

This project is a new initiative because the UTSCAP Network does not provide patient navigation services for Network patients.

Related Category 3 Outcome Measures:

OD-1 Primary Care and Chronic Disease Management:

- IT-1.110 Diabetes care: HbA1c poor control (>9.0%)

OD-3 Potentially preventable Re-Admissions- 30 day Readmission Rates

- IT-3.1 All cause 30 day readmission rate

Relationship to other Projects

The success of this initiative is highly dependent on the implementation of a number of other initiatives within UTSW contributions to the RHP9 plan. Likewise, developing this foundation will be critical to the success of most of the other projects included in the UTSW RHP program. This project is tightly linked to the following RHP projects:

- ***126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics:***

- ***126686802.2.1—Expanding the Medical Home Model in the UTSCAP Primary Care Network:***

- ***126686802.1.3—Implement a Quality Incentive Program for Network Primary Care Providers:***

- ***126686802.1.4—Implement UT Southwestern Population Management Infrastructure: UTSCAP Pri***mary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

    - ***126686802.2.5—Expanding Care Transition Programs: The development, implementation and e***valuation under standardized protocols and evidence-based care delivery model through a network of post-acute care providers to improve the care delivered to people during transitions ***o***f care will rely heavily on robust population management infrastructure.

Relationship to Other Performing Providers' Projects in the RHP: N/A

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks

to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the criteria listed below as being most significant to differentiate between projects. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 4 X 2 = **8**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 4 X 2 = **8**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 4.3 X 2 = **8.6**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 3 X 2 = **6**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 3.5 X 2 = **7**

Total Valuation Score for this project: **7.7**

Project Option 2.12.1 – Implement/Expand Care Transition Programs

RHP Project Identification Number: 126686802.2.5
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center Faculty Practice Plan/TPI 126686802

Summary Information

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices.

Intervention(s): This project will develop, implement and evaluate standardized protocols and evidence-based care delivery model through a network of post-acute care providers and community organizations to improve care delivered to people during transitions of care.

Need for the Project: The UTSCAP Network does not have a patient stratification system or care transitions protocols to ensure the efficient transition of care for our patients, resulting in diminished efficiency and quality of care.

Target Population: The target population is our UTSCAP Network patients (our patients) requiring transitions in care. Approximately 3% of our patients are either Mediciad eligible or indigent, so we expect at least 3% patients requiring transitions in care to be Medicaid eligible or indigent patients benefiting from this care.

Category 1 or 2 Expected Patient Benefits: The project seeks to (1) create a patient identification system using a validated risk assessment tool, (2) implement a case management related registry, (3) increase the number of care tranistions protocols by 5% in DY3, (4) increase the number of patients in the case management related registry by 5% in DY4, and (5) increase the number of times patients in our target population receive standardized care according to the approved clinical protocols and care transitions policies by 5% in DY5.

In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addtion, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to implement a roubust care transition program. By carefully managing transitions amongst providers and settings, UTSW expects to have a significant impact to RHP 9 patients. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income

patients, could be covered under this care transition program each year. This program will generate a substantial amount of transition care planning. Over the course of this project we expect this enhanced care transition activity will reduce unnecessary utilization and redirect care that would otherwise be provided in higher cost settings.

Category 3 Outcome Measures:

- IT-1.10 Diabetes Care: HgbA1C, IT-3.1 All cause 30 day readmission rate

Project Description

UT Southwestern proposes to develop, implement and evaluate standardized protocols and evidence-based care delivery model through a network of post-acute care providers and community organizations to improve care delivered to people during transitions of care.

Through this project, UT Southwestern will develop criteria and protocols around various discharge conditions, while identifying post-acute providers who can and will adhere to evidence-based practices. UT Southwestern will also identify "at risk" patients through data and risk stratification methodologies, engage PCPs, expand non-physician practitioner access, and introduce Care Coordinators to ensure proper post-discharge follow-up care in order to support improvement of baseline quality, cost, and other metrics. UT Southwestern will develop and implement post-discharge care management protocols targeted toward patients who are at higher risk for readmission, and ensure that patients receive post-discharge outreach according to the established protocols. The outreach protocol should at a minimum include discussion of the patient's symptoms/disease process, medication review, inquiry regarding living environment, and confirmation of clinician appointments.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals

The stated goal of our project is to implement improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. Ensuring hospital discharges are accomplished appropriately and that care transitions occur effectively and safely will be important to meeting the objectives of RHP9 patient populations. Care transitions refer to the movement of patients from one health care provider or setting to another. Transitions from hospital to home or nursing home have been shown to be problematic and costly. Safe, effective, and efficient care transitions and reduced risk of potentially preventable readmissions require cooperation among providers of medical services, social services, and support services in the community and in long-term care facilities. The lack of coordination that exists today has led to avoidable hospital readmission.

UT Southwestern's goal will be to develop care coordination teams, information resources, a network of high quality, efficient, and cost effective post-acute providers and community organizations in order to coordinate these care transitions with providers outside UT Southwestern's own delivery system so that post-acute patients will receive optimal care. UT Southwestern plans to work with existing nationally-recognized performance standards as well as develop proprietary standards to conduct engaged follow-up care by post-acute providers along with UT Southwestern's Faculty and affiliated physicians.

A major goal of the region is to improve the delivery of coordinated care and reduce likelihood of readmissions. This project would contribute to achieving that goal by developing care coordination teams, information resources, developing and implementing post-discharge care management protocols targeted toward patients who are at higher risk for readmission, and ensure that patients receive post-discharge outreach according to the established protocols. In addition, emergency department utilization is high in RHP 9 and by providing more patients with the coordinated care they need, when they need it, this project helps achieve the regional goal to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges

Historically, at all health care systems, including UT Southwestern, patients have been discharged from the acute inpatient setting without understanding all the care that was actually provided during the admission and what risks required continued management following discharge. Patients discharged back into the community without a pre-scheduled follow-up appointment and uncertain of how to care for themselves or what complications to look for, suffer an increase risk of relapse and readmission. In addition to creating unnecessary patient confusion and suffering, providers have not coordinated these transitions effectively amongst themselves.

Another challenge associated with inefficient care transitions is the resulting economic costs. Although post-acute care spending in RHP 9 is substantially higher than the national average, we aren't seeing the expected outcomes, i.e. improved health, from those investments. We must develop strategies to improve care transition programs while limiting spending growth to the health system overall. UT Southwestern's ownership of home health services provides an opportunity to substantially improve patient and/or caretaker understanding of treatment regimen and illness prevention education, while allowing the patient to return to a familiar setting for post-acute medical care sooner.

5-Year expected outcome for Provider and Patients

The 5-year expected outcome for UT Southwestern is primary care physician engagement, improved post-discharge processes and protocols, increased utilization of care coordinators and high quality/ highly educated non-physician practitioners, enhanced interpretation services, culturally educated providers, and coordinated care management. RHP 9 patients will enter the new primary care physician/patient-centric care continuum seamlessly and with highly engaged, quality providers. With timely post-discharge follow-up, problems with the patient's understanding and identification of possible complications can be quickly identified and addressed. Improved metrics will reflect the efforts through reduced cost, readmission rates, and improved quality outcomes. Finally, identifying and working with high quality network of post-acute providers that are committed to providing evidence based care will improve quality and cost efficiency.

Between December 2010 and November 2011, UTSW physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. In 2012, UT Southwestern Hospital – St. Paul had a total of 34,293 ER cases, of those cases 40% where provided to Medicaid/Charity/low income patients. Patients admitted through the ER had a substantially higher readmit rate than non-ER patients. In addtion, the percent of low income patients actually needing hospitalization was disproportionately low to all other patients who sought care in the ER. To benefit these and all RHP 9 patients, UTSW intends to implement a roubust care transition program. By carefully managing transitions amongst providers and settings, UTSW expects to have a significant impact to RHP 9 patients. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could be covered under this care transition program each year. This program will generate a substantial amount of transition care planning. Over the course of this project we expect this enhanced care transition activity will reduce unnecessary utilization and redirect care that would otherwise be provided in higher cost settings.

Patients will be actively supported by a broader array of healthcare professionals and processes to increase connections and checkpoints to confirm and stabilize and potentially improve their recovery. This program should improve the patient's understanding of care delivered, minimize unnecessary stress, and strengthen their role in recovery, creating a shared ownership of an improved health outlook. That engagement could also improve connections to lower cost channels and reduce ED intake.

Starting Point/Baseline

UT Southwestern has a robust electronic medical record system in both its inpatient and outpatient facilities. However, UT Southwestern via the UTSCAP Network has not developed and implemented a patient stratification system or care transition protocols. Thus, the starting point for this initiative, prior to December 1, 2011, is zero (0).

Rationale

UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, UT Southwestern's faculty physician practice is one of the largest providers of physician services to the Medicaid program in Texas. For example, between December 2010 and November 2011, UT Southwestern physicians provided care to Charity and Medicaid patients during 274,498 visits, of which 16,175 visits were specifically at UT Southwestern outpatient practices. Thus, UT Southwestern physician services are directly impacted by the negative outcomes created by inadequate transitions of care for the patients of RHP 9.

When a patient's transition is less than optimal, the repercussions can be far-reaching — hospital readmission, an adverse medical event, and even mortality. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs; patients cannot fully participate in their care during and after hospital stays. Additionally, poorly

designed discharge processes create unnecessary stress for medical staff causing failed communications, rework, and frustrations. A comprehensive and reliable discharge plan, along with post-discharge support, can reduce readmission rates, improve health outcomes, and ensure quality transitions. Patient transition is a multidimensional concept and may include transfer from the hospital to home, or nursing home, or from facility to home and community-based services, etc.

Development of a seamless transition from an inpatient environment to an outpatient setting, possibly with the use of home health or palliative care services, or if appropriate a strategically selected alternative institutional setting, such as a high quality and cost effective LTAC or SNF is important for optimizing quality and efficiency. In addition to implementing primary care physician-centric information and care management models, we must ensure adequate metrics are identified and implemented to document and improve results for all constituencies, resulting in a decrease of readmissions and costly medical interventions.

Project components

To accomplish UT Southwestern's ultimate goal of implementing improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings, UT Southwestern's project includes the following core elements:

a. Review best practices from a range of models (e.g. RED, BOOST, STAAR, INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc.),

b. Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool (e.g. the Institute for Healthcare Improvement's (IHI) State Action on Avoidable Re-hospitalizations (STAAR) tool) and patient Interviews,

c. Integrate information systems so that continuity of care for patients is enabled,

d. Develop a system to identify patients being discharged potentially at risk of needing acute care services within 30-60 days,

e. Implement discharge planning program and post discharge support program,

f. Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, and home care providers,

g. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

To progress towards this objective, UT Southwestern has selected a number of milestones and metrics that are relevant to the community needs and priorities of RHP 9. These milestones and metrics are more fully described in the table below.

Unique community need identification number the project addresses:

- CN.3-Healthcare Capacity
- CN.8-Specialty Care
- CN.9-Chronic Disease
- CN.11-Patient Safety and Quality
- CN.12-Emergency Department Usage and Readmissions

How the project represents a new or significantly enhances an existing delivery system reform initiative

As described herein, the current environment in RHP 9 and UT Southwestern for these important care transitions is not optimally coordinated. UT Southwestern still must rely on the manual transmission of data when transferring care outside of UT Southwestern. This has lead to less than optimal quality results, higher ER utilization, patient dissatisfaction, and avoidable readmissions. By materially enhancing the coordination of these transitions amongst providers and the tools to accomplish this coordination, the UTSCAP Network will be able to address the issue of uncoordinated transitions of care within our region.

Related Category 3 Outcome Measures:

OD-1 Primary Care and Chronic Disease Management:

- IT-1.10 Diabetes care: HbA1c poor control (>9.0%)

OD-3 Potentially preventable Re-Admissions- 30 day Readmission Rates

- IT-3.1 All cause 30 day readmission rate

With post-acute care spending in RHP 9 being substantially higher than the national average, we selected a standalone measure from the domain of potentially preventable re-admission rates. This is where we believe the impact of our project will be measureable. In addition, we selected a standalone measure to access the control of diabetes in our patients. Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after

diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars. RHP 9 has similar opportunity to benefit from improvements in identifying and managing patients with this condition. While UT Southwestern's ultimate goal is implementing improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings, UT Southwestern's selected diabetes care as our outcome measure because of the prevalence of diabetes in our region.

We subscribe to the theory that if you don't measure things you can't manage them. UT Southwestern will focus on these outcomes for all our attributed patients, irrespective of their socioeconomic status. As a result, we believe focusing on these outcomes will make a measurable difference for individuals in RHP 9 at all income levels.

Relationship to other Projects

The success of this initiative is highly dependent on the implementation of a number of other initiatives within UT Southwestern contributions to the RHP9 plan. Likewise, developing this foundation will be critical to the success of most of the other projects included in the UT Southwestern RHP program. This project is tightly linked to the following RHP projects: 2.1.1, 1.1.2, 1.4.2, 1.10.2, 1.7.1, 2.11.2, and 2.9.1.

- ***126686802.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics:*** This project improves access to primary care services by creating a robust Network of efficient, quality primary care physicians for RHP 9 patients.

- ***126686802.1.3—Implement a Quality Incentive Program for Network Primary Care Providers:*** UTSCAP Primary Care Network clinics will be able to participate in a quality incentive program. However, their ability to participate in this quality incentive program will be dependent upon their enrollment and participation in the Medicaid program, creating an environment whereby primary care physicians see all populations as a viable part of a broader patient population management program.

- ***126686802.1.4—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.2.5—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the

Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the criteria listed below as being most significant to differentiate between projects. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criteria: 5 X 2 = **10**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. This project's score for this criteria: 4.5 X 2 = **9**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. This project's score for this criteria: 4.75 X 2 = **9.5**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. This project's score for this criteria: 4.5 X 2 = **9**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.This project's score for this criteria: 4.5 X 2 = **9**

Total Valuation Score for this project: **9.4**

Project Option 2.11.2: Conduct Medication Management

RHP Project Identification Number: 126686802.2.6
Performing Provider Name/TPI: The University of Texas Southwestern Medical Center ("UT Southwestern" or "UTSW") Faculty Practice Plan/ TPI 126686802

Summary Information:
Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, 24% of UTSW patient charges were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will implement an enhanced patient medication management program that should lead to improved health outcomes for UT Southwestern patients of RHP 9.

Need for the Project: An untold number of readmissions and other healthcare resource consumption can be linked to poor medication management. Our Region has a high rate of readmissions and ED usage. As an academic medical center, UT Southwestern is routinely the referral destination for many of the RHP 9's most complex patients. Complex patients are more likely to have a larger number of medications, which can increase the odds of higher hospital readmission rates. UT Southwestern believes improvements in medication management will lead to improved quality and reduce unnecessary utilization.

Target Population: The target population is all patients seen by UT Southwestern. At this point it's difficult to precisely predict the impact of this initiative on various segments of our target population, but we expect the benefits of the Medication Management project to impact Medicaid and/or indigent patients proportionally to their percentage of the target population.

Category 1 or 2 Expected Patient Benefits: We expect improved PCP prescribing practices (particularly for physician outliers), which would represent more consistent and outcome-based prescribing actions. We also expect benefits associated with patients being more engaged in their own care as well as being able to avoid the inconvenience of unnecessary readmissions, ED visits, and doctor visits. UTSW intends to implement a robust medication management program. By carefully managing patient medications, UTSW expects to have a significant impact to RHP 9 patients. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could be impacted by this medication program each year. This program will generate a substantial amount of medication management. Over the course of this project, we expect this enhanced medication management activity will reduce unnecessary utilization and cost that would otherwise be born by the system.

Category 3 Outcome Measures: IT-3.12 Other - readmission rate - medications readmissions

Project Description:

UT Southwestern proposes to implement an enhanced patient medication management program that should lead to improved health outcomes for patients of RHP 9.

Using analytic tools leveraging EMR, claims, and other data, staff will identify patients at high risk for developing complications and co-morbidities. Related patient information in the EMR will be used to review the complete medication regimen. Patients will then receive counseling and education about the medications, and an action plan will be developed that includes patient education, goal setting and potential adjustments in the medication regimen. Patient response will then be monitored and adjustments made accordingly. Analytic tools will be used to alert staff when patients have not refilled their medications according to the protocol. Root cause analysis will be used to identify potential medication errors and quality improvement processes will be used to address the causes.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

Develop a capability to conduct Medication Management for the population to tightly manage patient pharmaceuticals and avoid adverse events associated with medical misuse. The project goals are as follows:

- Develop patient medication tracking for all prescriptions inside and outside health system
- Conduct evaluations of the particular risks based on medication, dosage, counter-indications, co-morbidities, and episodic factors
- Address instructive measures for patients and providers knowing medication alternatives and responsibilities associated with the regimen
- Assist patients in compliance in the regimen with lists, pill cases, and reminders through various means flexible to the patient's preferred technology and media

Establish linkages to other parts of integration, including vital monitoring, telemedicine, and others that enhance the patient experience and outcomes.

This project also meets the following regional goals:

A major goal of the region is to provide improved access to coordinated primary and specialty care. This project would contribute to achieving that goal by establishing systems to improve medication management. An untold number of readmissions and other healthcare resource consumption can be linked to poor medication management. Attempting to increase the

utilization of generic drug use when appropriate also reduces cost, which is also a regional issue.

Challenges:
Historically, medications have been managed depending on the personal expertise and communication style of the physician. In addition, patients have had various levels of interest in education and optimization based on the trust of that provider. Overcoming the challenges of moving from a 1:1 approach to something global and comprehensive in nature will require multiple flexible solutions to meet provider and patient needs. This will help improve all parties understanding of options, patient engagement opportunities, and expected outcomes.

UTSW would overcome these challenges by leveraging technology to assess the information and efficiently deliver information to providers and patients to support an optimized regimen. Key relationships would be developed to extend technology and support distributing information flexibly.

5-Year Expected Outcome for Provider and Patients:
The 5-year expected outcome for Providers is improved PCP prescribing practices (particularly for outliers), which would represent more consistent and outcome-based prescribing actions. We also expect benefits associated with patients being more engaged in their own care as well as being able to avoid the inconvenience of unnecessary readmissions, ED visits, and doctor visits.

UTSW physicians provided care to Charity and Medicaid patients during 16,175 visits which were specifically at UT Southwestern outpatient practices. UTSW intends to implement a robust medication management program. By carefully managing patient medications, UTSW expects to have a significant impact to RHP 9 patients. UTSW expects that by DY5 approximately 277,000 patients, including 44,000 Medicaid/low income patients, could be impacted by this medication program each year. This program will generate a substantial amount of medication management. Over the course of this project, we expect this enhanced medication management activity will reduce unnecessary utilization and cost that would otherwise be born by the system.

Starting Point/Baseline:
Region patients currently experience little organized support in this very important aspect of maintaining health under maintenance medications. Understanding their medications and options is limited to what information was provided potentially some time ago. Identifying related cohorts and assessing risks and opportunities will help to avoid adverse events.

Key baseline statistics would be patients under Medication Management as well as establishing the ability to track individual issues that can educate a provider or improve patient outcomes (e.g., mis-prescribed antibiotics). UTSW will initiate this project in DY2.

Rationale:
More than 3.5 billion prescriptions are written annually in the United States (Sommers JP. Prescription drug expenditures in the10 largest states for persons under age 65, 2005.2008. Agency for Healthcare Research and Quality. Available at: http://meps.ahrq.gov/mepsweb/data_files/publications /st196/stat196.pdf. Accessed 10/11/12). Medications are involved in 80 percent of all treatments and impact every aspect of a patient's life. According to the World Health Organization, adherence to therapy for chronic diseases in developed countries averages 50%, and the major consequences of poor adherence to therapies are poor health outcomes and increased health care costs (WHO. 2003. Adherence to long-term therapies: Evidence for action. Available at: http://whqlibdoc.who.int/ publications/2003/9241545992.pdf. Accessed 10/11/12). Drug-related morbidity and mortality costs exceed $200 billion annually in the U.S., exceeding the amount spent on the medications themselves (Johnson J, Bootman JL. Drug-related morbidity and mortality. Arch Intern Med. 1995; 155(18):1949-1956; Johnson JA, Bootman JL. Drug-related morbidity and mortality. Am J Health Syst Pharm. 1997; 54(5):554-558; Ernst, FR, Grizzle AJ. Drug related morbidity and mortality: Updating the cost-of-illness model. J Am Pharm Assoc. 2001; 41(2):192-199)).

Patients with chronic diseases and multiple chronic conditions are likely to be on multiple medications for long periods of time thereby increasing the risk of medication errors. Considering the high rates of chronic diseases in our region, this projects would potentially lead to improved outcomes and cost savings for the health system.

Project Components:

Evidence-based interventions that put in place the teams, technology and processes to avoid medication errors. This project option could include one or more of the following components:

a) Develop criteria and identify targeted patient populations; e.g. chronic disease patient populations that are at high risk for developing complications, co-morbidities, and/or utilizing acute and emergency care services.
b) Develop tools to provide education and support to those patients at highest risk of an adverse drug event or medication error.
c) Conduct root cause analysis of potential medication errors or adverse drug events and develop/implement processes to address those causes
d) Conduct quality improvement for project using methods such as rapid cycle improvement.

How the project represents a new or significantly enhances an existing delivery system reform initiative:

Community Needs Addressed:
As indicated in the RHP 9 Community Needs Assessment, the demand for primary and specialty care services exceeds that of available medical physicians, thus limiting access to healthcare

services for chronic disease management or preventive services. The specific and unique community need identification numbers that this project addresses include the following:

- CN.4-Primary Care and Pediatrics
- CN.8- Chronic Disease Management
- CN.11-Patient Safety and Quality
- CN.12-ED Usage and Readmissions

Related Category 3 Outcome Measure(s):

IT-3.12 Other - readmission rate - complications of medications readmissions

Reasons/rationale for selecting the outcome measures:
The relationship between hospital readmission rates and quality of care is well-documented. Some readmissions are caused from medication complications from the index admissions or from circumstances surrounding the initial hospital stay. Patients who take a large number of medications in particular have high hospital readmission rates and high rates are considered by some as an indication of weakness in the overall care of patients with a particular condition. Only readmissions to the same facility will be included as part of each hospital's rates.

Relationship to other Projects:
Medication management is an important component of our planned delivery system reform and is related to other planned UT Southwestern DSRIP projects. This is an important component to reaching our patient population right where they have needs related to their medications in a low-cost setting while ensuring high quality, evidence-based care is delivered. The success of this initiative is highly dependent on the implementation of the following other projects proposed by UT Southwestern:

- ***126686802.1.1.2—Expanding Existing Primary Care Capacity in the UTSCAP Network: Via UT Southwestern Ambulatory Clinics and Affiliated, Community Primary Care Clinics:*** This project improves access to primary care services by creating a robust Network of efficient, quality primary care physicians for RHP 9 patients. As community-based primary care physicians join the Network, they will no longer be practicing in "isolation". Through clinical integration with UT Southwestern faculty physicians, these community-based primary care physicians will engage in the continual development and implementation of clinical "best practice" protocols for the diseases treated by all Network physicians that are also responsible for the largest percentage of medical costs.

- ***126686802.1.1.4—Implement a Quality Incentive Program for Network Primary Care Providers:*** UTSCAP Primary Care Network clinics will be able to participate in a quality incentive program. However, their ability to participate in this quality incentive program will be dependent upon their enrollment and participation in the Medicaid program, creating an environment whereby primary care physicians see all populations as a viable part of a broader patient population management program.

- ***126686802.1.10.2—Implement UT Southwestern Population Management Infrastructure Development:*** UTSCAP Primary Care Network clinics will provide services to Network patients via a Network-wide population management infrastructure to improve quality and efficiency in the care they deliver.

- ***126686802.2.9.1—Implement/Expand Care Coordination Programs:*** UTSCAP Primary Care Network clinics will provide services to Network patients via access to the Network's care coordinators, ensuring that all Network patients receive coordinated, timely, and site-appropriate health care services.

Relationship to Other Performing Providers' Projects in the RHP: N/A

Plan for Learning Collaborative:
The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:
The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 2.5 X 2 = **5**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 2.5 X 2 = **5**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 2.5 X 2 = **5**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 3.175 X 2 = **6.35**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 3 X 2 = **6**

Total Valuation Score for this project: **5.10**

These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option: 2.9.1
Title of Project: Implementation of an emergency department patient navigation system

Unique Project ID: 175287501.2.1 (Pass 2)
Performing Provider Name/TPI: The University of Texas Southwestern University Hospitals/ TPI 175287501

Project Summary

Provider: The University of Texas Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds 452-beds in the St. Paul and Zale Lipshy buildings and 40 hospital-based and ambulatory-based clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within RHP 9 safety-net hospitals, specifically Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. For example, between December 2010 and November 2011, an average of 24% of UTSW patient visits were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will establish an emergency department navigator system for patients without a known primary care physician. At first this project will cover 5 days per week but expand hours according to target population needs.

Need for the project: Currently, 30% of patients seen in our ED do not have a documented Primary Care Physician (PCP) for follow up/urgent care and primary care (using third quarter UTSW 2012 data).

Target population: The target population will be all patients presenting at the UTSW University Hospitals ED without a documented primary care physician. Our hospital attributes 11% of its days serving Medicaid (i.e. based on weighted patient days), while our faculty clinical practice population is comprised of approximately 3% Medicaid and indigent patients. Thus, we expect at least 11% of the navigator services to benefit Medicaid and/or indigent patients. The most recent data we have regarding the number of Medicaid and charity patients seen in our ED shows 12,663 cases in FY12.

Category 1 or 2 expected patient benefits: This project is expected to reduce potentially preventable hospitalizations for ambulatory care sensitive conditions. We project that 25% of patients without a primary care physician will receive a referral during DY4 and 50% will receive such a referral during DY5. By end of project, 5,250 patients per year will receive referral to a primary care physician from our ED including 1000 Medicaid patients who do not have an identified primary care physician.

Category 3 outcomes:

- IT-2.12 Prevention Quality Indicators (PQI) Composite Measure Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions.

Project Description:

This project will utilize project option 2.9.1. Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care. The project will implement a patient navigator system in the UT Southwestern University Hospitals Emergency Department (ED) to assist patients with special needs and patients without a primary care provider in connecting with the necessary provider. The goal will be to decrease the number of patients seen in the ED who do not have a primary care physician identified in the UT Southwestern electronic record.

Many patients are seen in the ED who do not have an identified primary care physician and consequently receive inadequate follow up for ED visits and inadequate primary preventive care. The 5 year outcome for this project will be to reduce the percent of patients seen in our ED who do not have an identified primary care physician in our electronic health record (EHR). Currently, the ED at UT Southwestern University hospitals sees 33-35,000 visits per year. Of these patients, 30% do not have an identified Primary Care Physician (PCP) using third quarter 2012 data. The target population will be the 9,900 – 10,500 patients seen in the Emergency Department without a primary care physician. We estimate that 1080 – 1150 of these patients will have Medicaid or be indigent based on the above numbers and percentages. The cost avoidance realized in this project will be measured by reduced preventable admissions. During the baseline determination, the project will determine the number of preventable admissions then reduce those admissions by 5% during DY4 and DY5 each. According to the RHP 9 Needs Assessment, each of the avoided admissions will save Medicaid patients $47,500. The most recent data we have regarding the number of Medicaid and charity patients seen in our ED can be seen in this table.

Payor Group	Total Charge	Cases	ENR
Medicaid Total	**$6,687,830**	**4,375**	**$1,145,553**
	11.3%	15.9%	5.0%
Self Pay	**$12,673,790**	**8,288**	**$6,780,261**
	21.5%	30.0%	29.6%
Total Medicaid/Charity/Self Pay	**$19,361,620**	**12,663**	**$7,925,814**
	32.8%	45.9%	34.6%

During the baseline determination, the project will determine the number of preventable admissions then reduce those admissions by 5% during DY4 and DY5 each. Since the average

cost of a Medicaid admission costs $47,000 we predict that the approximately 100 admissions that would be prevented in Medicaid patients will result in about $4.7M saved by cost avoidance.

Collaboration

This project is one of two projects being proposed through a collaboration agreement. The specific collaboration arrangement specific to this project is set forth below.

Collaborators	DY2	DY3	DY4	DY5	Total
Parkland Memorial Hospital	751,352	1,325,241	1,447,902	1,617,111	5,141,606
Project / Collaboration	**DY2**	**DY3**	**DY4**	**DY5**	**Total**
Category 2 Project Value	1,242,668	1,270,954	1,268,783	1,024,645	4,807,050
Related Category 3 Projects Value	146,196	169,461	271,925	650,255	1,237,837
Total Project Value	**1,388,864**	**1,440,415**	**1,540,708**	**1,674,900**	**6,044,887**

The collaboration involves the transfer of Pass 2 allocated dollars from Parkland Memorial Hospital (public entity) to the performing provider (public entity). The combined project value for this project exceeds the funding provided by the collaborating entity.

The collaborating parties have joined together in this collaboration with the belief that the goals of this project are valuable and will contribute to regional transformation.

Goals and Relationship to Regional Goals:

The goals of this project are aimed at reducing unnecessary ED visits and hospitalization by patients who do not have an identified primary care physician. Our goals are related to the Regional goals of reducing unnecessary ED utilization and improving the burden of chronic diseases by increasing access to primary care.

Challenges: At UTSW we are challenged with a problem of ED patients not having a primary care physician they can see for follow up or for urgent care. Consequently, these patients return for urgent care to the emergency department or have inadequate follow up for visits to the emergency department. This project will seek to decrease that problem.

5-Year Expected Outcome for Provider and Patients: Over the span of this project we plan to decrease the number of patients seen in our ED who do not have adequate follow up for chronic conditions and thereby reduce the number of potentially preventable admissions to the hospital. Over the span of this project, we estimate approximately 2000 Medicaid patients who do not have a primary care provider will be referred to such a provider.

Starting Point/Baseline:
Currently, the ED at UT Southwestern University hospitals sees 33-35,000 visits per year. Of these patients, approximately 8% are unfunded and 30% do not have an identified Primary Care Physician (PCP) using third quarter 2012 data.

Rationale:
Patients who have no primary care physician are frequently seen for episodic care in the ED. Providing these patients with a primary care option for routine and urgent care is a viable method to decrease ED utilization for non-emergencies.

The following core components will be part of this project implementation and documented as such:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
c) Connect patients to primary and preventive care.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Milestones

DY2 - P-1 Conduct a needs assessment to identify the patient population(s) to be targeted with the patient navigator program.
DY3 – P-2 Establish/expand a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigator education.
DY4 I-6.3 Percent of patients without a primary care provider who were referred to a primary care provider in the ED
DY5 I-6.3 Percent of patients without a primary care provider who were referred to a primary care provider in the ED

Unique community need identification numbers the project addresses:

- CN.9 Chronic Disease
- CN.3 Healthcare Capacity
- CN.12 Emergency Department Usage and Readmissions

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: currently we do not have any means of directly referring patients to a specific primary care provider. This project will establish such a service.

Related Category 3 Outcome Measure(s):

One effect of poor primary care access is the need for hospitalization for conditions that can be treated as an outpatient with appropriate follow up with a primary care physician. To measure the effectiveness of this program we have chosen the following Category 3 outcome measure to see if the program is having the desired effect on unnecessary hospitalizations:

OD-2 Primary Care and Chronic Disease Management

- IT-2.12 Prevention Quality Indicators (PQI) Composite Measure Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions.
-

Reasons/rationale for selecting the outcome measure:

Hypertension is a frequent cause of ED visits and minority and low income populations are particularly vulnerable. This project, by identifying patients with hypertension who do not have a primary care provider should improve the control of blood pressure in this population.

Relationship to other Projects:

This project supports many other UTSW projects, including the following:

- 126686802.1—Establishing a New Primary Care Community Outreach Center
- 126686802.2—Expanding the Medical Home Model in the UTSCAP Primary Care Network
- 126686802.4—Implement/Expand Care Coordination Programs
- 126686802.1—Implement UT Southwestern Population Management Infrastructure Development

Plan for Learning Collaborative:

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied

towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 2 X 2 = 4

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 1.8 X 2 = 3.6

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 1.75 X 2 = 3.5

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 2 X 2 = 4

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 2 X 2 = 4

Total Valuation Score for this project: 8.80

Project Option: 2.10.1 - Implement a Palliative Care Program to address patients with end-of-life decisions and care needs
Title of Project: Expanding Palliative Care at UT Southwestern Medical Center

Unique Project ID: 175287501.2.2 (Pass 2)
Performing Provider Name/TPI: UT Southwestern University Hospital/ 175287501

Summary Information

Provider: UT Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds St. Paul and Zale Lipshy Hospitals, and 40 clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. UT Southwestern physicians provide a majority of the physician services within Parkland Memorial Hospital and Children's Medical Center at Dallas. In addition, the UTSW Faculty Practice Plan is one of the largest medical providers of physician services to Medicaid in Texas. Between December 2010 and November 2011, an average of 24% of UTSW patient visits were attributed to Medicaid patients across Parkland, Children's and UT Southwestern.

Intervention(s): This project will expand the palliative care service to provide comprehensive palliative care services to all patients of the UT Southwestern Health System.

Need for the project*:* As identified in the Community Needs Assessment for RHP 9, the lack of specialized palliative care services in our Region is a major concern. UT Southwestern seeks to address this gap in care by increasing palliative care services.

Target population: The target population will be all patients of the UT Southwestern Health System in need of palliative care services. Our hospital attributes 11% of its days serving Medicaid patients (based on weighted patient days), while our Faculty Practice population is comprised of approximately 3% Medicaid and indigent patients. It is expected that this new service will care for 900 inpatients consultations of which 100 will be Medicaid patients, and account for 3,000 outpatient visits over the span of the project of which 90 will be Medicaid patients in need of palliative care services.

Category 1 or 2 expected patient benefits: We expect that 200 new patient palliative consultations will be performed in DY3, 350 in DY4, and 500 in DY5. By DY5, 90% of patients will have chart documentation about preferences for life support options. Outpatient palliative care services will be provided for all patients identified in both the inpatient and outpatient setting. Patients will also realize improved quality of consultation through Category 3 projects.

Category 3 outcomes:

- IT-13.1 Pain assessment
- IT-13.2 Treatment Preferences

- IT-13.5 Percentage of patients with documentation in the clinical record of a discussion of spiritual/religions concerns or documentation that the patient/caregiver did not want to discuss

Project Description:

The project utilizes project option 2.10.1 and will entail identifying patients who are in need of palliative care from the inpatient and oupatient services at UTSW. Patients identified will be those who are considered to have a high risk of dying with 6 months of identification. Patients will be screened based on meeting one or more of the following criteria: severe life-threatening illness, progressive terminal illness, significant exacerbation of chronic debilitating illness, or declining quality of life and independent functioning in the past 6 months. These patients will receive a palliative care consultation in collaboration with their primary care team. The goals of care which may include transitioning the patients from acute hospital care into home care, hospice or a skilled nursing facility. Patient/family experience surveys regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care will also be implemented.

This project will require the recruitment of physicians trained in palliative care and other team staff to expand the existing palliative care program. UTSW currently has an active palliative care program at Parkland Health and Hospital System which cannot cover the expanded need outside of Parkland. This project will exand this program to the UTSW faculty practice to fill this void.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goal and Relationship to Regional Goals:

Patients receive dignified and culturally appropriate end-of-life care, which is provided for patients with terminal illnesses in a manner that prioritizes pain control, social and spiritual care, and patient/family preferences.

Challenges:

Need: Patients experiencing one of the conditions above need education and information about the dying process and the various options for care and help fullfilling those wishes in the existing health care environement.

Implementation: Staff recruitment and retention. The project will facillitate appropriate palliative care b providing increased numbers of providers who are trained in providing that care

5-Year Expected Outcome for Provider and Patients:

Increased uptake of palliative care services, greater involvement of patients and/or their families in end-of-life decisions, and increased satisfaction with end-of-life care. We expect at least 11% of these expanded services to benefit Medicaid and/or indigent patients. It is expected that this new service at the University Hospitals and Clinics will care for 900 new inpatients consultations of which 100 will be Medicaid patients and account for 3000 outpatient visits over the span of the project of which 90 will be Medicaid patients in need of palliative care services.

Starting Point/Baseline:

Currently, our Palliative Care Program takes care of patients at Parkland Health and Hospital System without a formal component at UT Southwestern Medical Center. Some palliative care is provided by individual services at UTSW but there is no formal program. The aim of this project will be to expand the formal program at PHHS to UT Southwestern. The baseline of services provided currently without the program at UTSW will be determined during DY3.

Rationale:

Providers provide end of life care for many more conditions than just end stage cancer. The use of palliative care in these patients can greatly improve the quality of life experienced by these patients and improve the chances of the health care system acting in accordance with patients wiishes. The goal of palliative medicine is to improve or maintain quality of life in patients with life-limiting or life-threatening diseases. Palliative medicine is a recognized medical subspecialty of both the American Board of Medical Specialties and American Osteopathic Association. Palliative medicine involves the control of symptoms associated with chronic disease such as nausea, pain and shortness of breath for example, as well as management of the symptoms that are part of the dying process.

Palliative care programs have been shown to provide cost savings while improving patients experience with dying (Archives of Internal Medicine, 2008).

Project Components:

Through the Expanding Palliative Care Project, we will meet the required project components listed below.

a) Develop a business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program

b) Transition palliative care patients from acute hospital care into home care, hospice or a skilled nursing facility

c) Implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care and improve scores over time

d) Conduct quality improvement for project using methods such as rapid cycle improvement.

Milestones and Metrics

Process Milestones and Metrics:

Milestone 1 [P-1.]: Develop a hospital-specific business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program
Metric 1 [P-1.1.]: Business case
Milestone 2 [P-5.]: Implement a palliative care program
Metric 2 [P-5.1.]: Implement comprehensive palliative care program

Improvement Milestones and Metrics:

Milestone 3 [P-6.]: Increase the number of palliative care consults
Metric 3 [P-6.1.]: Palliative care consults meet targets established by the program
Milestone 4 [I-9.]: Palliative care patients transitioned from acute hospital care into hospice. Home care, or skilled nursing facility (SNF) with and without hospice services
Metric 4 [I-9.1.]: Number of palliative care discharges to home care, hospice, or SNF/Total number of palliative care discharges
Milestone 5 [I-11.]: Establish the comfort of dying for patients with terminal illness within their
end-of-life stage of care
Metric 5 [I-11.5.]: Percentage of patients with chart documentation of preferences for life sustaining treatments.
Milestone 6 (P-6) Increase the number of palliative care consults

Unique community need identification numbers the project addresses:

- CN.12 Emergency Department Usage and Readmissions
- CN.13 Palliative Care

Related Category 3 Outcome Measure(s):

The related Category 3 outcome measures were chosen because they significantly affect the quality of life of patients who are in need of palliative care services and the satisfaction with palliative care services provided. Lack of documentation of these measures has been identified as a deficiency in the care of many palliative care patients.

OD-13 Palliative Care

- IT-13.1 Pain assessment—Increase the number of patients enrolled in hospice OR receiving palliative care who received a comprehensive clinical assessment to determine the severity, etiology and impact of their pain within 24 hours of screening positive for pain on the admission evaluation / initial encounter.
- IT-13.2 Treatment Preferences—Percentage of seriously ill patients enrolled in hospice OR receiving specialty palliative care in an acute hospital setting with chart documentation of preferences for life sustaining treatments.

- IT-13.5 Percentage of patients receiving hospice or palliative care services with documentation in the clinical record of a discussion of spiritual/religions concerns or documentation that the patient/caregiver did not want to discuss. (NQF 1647 modified) (Non-standalone measure). Increase the number of patients discharged from hospice or palliative care with clinical record documentation of spiritual/religious concerns or documentation that the patient/family did not want to discuss during the reporting period.

Reasons/rationale for selecting the outcome measures:

The outcome measure chosen are standard measurement of the effectiveness of palliative care programs. These measures were chosen because this project involves the creation of a formal palliative care service where none currently exists.

Relationship to other Projects

175287501.2.3 Transitional Care Services for Cancer Patients
126686802.1.11 Oncology Urgent Care Services

Relationship to Other Performing Providers' Projects in the RHP:

Currently a formal Palliative Care Service is functioning at the Anchor, Parkland Health and Hospital System. This project will expand this program to include UT Southwestern Medical Center's University Hospitals and Clinics which are not currently being served by the service at the Anchor.

Plan for Learning Collaborative:

The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:

The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-

point scale for each criteria rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using that criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)).

This project's score for this criteria: 3 X 2 = 6

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population.

This project's score for this criteria: 2.5 X 2 = 5

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues.

This project's score for this criteria: 3.5 X 2 = 7

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person.

This project's score for this criteria: 2.45 X 2 = 4.90

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability.

This project's score for this criteria: 3 X 2 = 6

Total Valuation Score for this project: **5.49**

These values are provided for in the table below and are allocated equally amongst the milestones.

Project Option: 2.12.2 Implement 1 or more pilot interventions in care transitions
Title of Project: Expand Transitional Care Program for Cancer Surgery Patients

RHP Project Identification Number: 175287501.2.3 (Pass 2)
Performing Provider Name/TPI: UT Southwestern– St. Paul University Hospital /TPI 175287501

Summary Information

Summary Description: UT Southwestern proposes to expand its Transitional Care Program for Cancer Surgery Patients that it started over one year ago. We currently provide transitional care services only for Hematology-Oncology and Gynecologic Oncology patients. With additional resources from this project, the program will be expanded to include Surgical Oncology, Thoracic Surgery, Neuro-Surgery and Breast Surgery patients. The transitional care team includes physicians, mid-level providers, nurses, social workers, pharmacists, psychologists, and financial counselors.

Provider: The UT Southwestern Medical Center ("UTSW" or "UT Southwestern") operates 452 inpatient beds in the St. Paul and Zale Lipshy Hospitals and clinics on its Dallas campus. Faculty and Residents provide care to more than 100,000 hospitalized patients and oversee nearly 2 million outpatient visits a year. The Harold C. Simmons Cancer Center has National Cancer Institute (NCI) designation. The Simmons Cancer Center is the only medical center in North Texas to attain this prestigious "gold standard" status, which the NCI bestows upon the nation's top cancer centers in recognition of innovative research and excellence in patient care. The expertise of the physicians extends to every cancer, from breast, urologic, gynecologic, lung, gastrointestinal, head and neck, brain, and skin to lymphomas, leukemia, and bone marrow transplantation.

Intervention(s): Cancer surgery patients are one of many inpatient diagnostic categories that have very complex needs during the hospital stay and during their navigation of post-discharge continuum of care. The Transitional Care Services program greatly enhances collaboration and communicaton between inpatient care givers and the myriad outpatient, post-acute care, home and physician office providers. The process improves patient satisfaction, assures a tighter continuum of care for better overall outcomes, reduces the chance of re-admissions because fewer missteps are taken with nutrition, medication management, adherence to discharge instructions, physician office visit scheduling, and the patients ability to cope with everything going on with their care.

Need for Project: The RHP 9 Community Needs Assessment indicates a substantial need to improve transitional care support services. Cancer patients represent most of the highest cost ED encounters for all payors. In addition, potential preventable admissions of cancer patients are among the most expensive admissions for all payors sources. Cancer-related Medicaid and Uninsured inpatient encounter costs totaled $23,089,618 compared to the total cost for all payors of $86,421,715.

Target Population: All cancer patients treated at St. Paul University Hospital will benefit from the program. At present, between 3% and 4% of cancer patients are Medicaid or low-income patients. In FY2012, there were 2,009 cancer patient discharges, with 1,214 being hematology/oncology patients discharged from St. Paul Hospital.

Category 2 Expected Patient Benefits: By the end of DY5, it is projected that approximately 9,000 cancer patients (DY2: ~2100, DY3: ~2200, DY4: ~2300, DY 5: ~2400) will be discharged from UTSW University Hospital. Approximately 360 of those patients will be Medicaid (DY2: ~40, DY3: ~70, DY4: ~110, DY5: ~140. Cost savings for each Medicaid avoidable readmissions range from $30,000 to $164,000.

Category 3 Outcomes:

OD-3 Potentially preventable Re-Admissions- 30 day Readmission Rates
IT-3.1 All cause 30 day readmission rate

Project Description:

UT Southwestern proposes to expand its Transitional Care Program for Cancer Patients that it started over one year ago. We currently provide the transitional care services for Hematology-Oncology and Gynecologic Oncology patients. With additional resources from this project, the program will be expanded to include Surgical Oncology, Thoracic Surgery, Neuro-Surgery and Breast Surgery patients. The beneficiaries of the program have a more seamless continuum of care. The transitional care team includes physicians, mid-level providers, nurses, social workers, pharmacists, psychologists, and financial counselors.

UT Southwestern will continue to develop and improve the criteria and protocols around various discharge conditions, while identifying post-acute providers who can and will adhere to evidence-based practices. UT Southwestern will continue to identify "at risk" patients through data and risk stratification methodologies, and expand the number of Transitional Care Team members to ensure seamless post-discharge follow-up care in order to support improvement of baseline quality, cost, and other metrics. UT Southwestern will develop and implement post-discharge care management protocols targeted toward patients who are at higher risk for readmission, and ensure that patients receive post-discharge outreach according to the established protocols. The outreach protocol should at a minimum include discussion of the patient's symptoms/disease process, nutrition needs, psychological needs, medication review, inquiry regarding living environment, and confirmation of follow-up clinician appointments.

Collaboration

This project is **not** being proposed through a collaboration agreement.

Goals and Relationship to Regional Goals:

The stated goal of our project is to implement improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. Transitions from hospital to home or nursing home have been shown to be problematic and costly. Safe, effective, and efficient care transitions and reduced risk of potentially preventable readmissions require cooperation among providers of medical services, social services, and support services in the community and in long-term care facilities. The lack of coordination that exists today has lead to avoidable hospital readmission.

Project Goals:
The project plans to expand the types of patients who receive comprehensive transitional care services. By DY5, the services will be available to all cancer patients regardless of subspecialty.

This project also meets the following regional goals:
A major goal of the region is to improve the delivery of coordinated care. This project would contribute to achieving that goal by developing and implementing post-discharge care management protocols targeted toward patients who are at higher risk for readmission, and ensure that patients receive post-discharge outreach according to the established protocols. In addition, emergency department utilization is high in RHP 9 and by providing more patients with the coordinated care they need, when they need it, this project helps achieve the a regional goal to keep patients from unnecessarily using the emergency departments and urgent care centers as a means to receive basic care.

Challenges:
Historically, at all health care systems, including UT Southwestern, patients have been discharged from the acute inpatient setting without understanding all the care that was actually provided during the admission and what risks required continued management following discharge. Patients discharged back into the community without a pre-scheduled follow-up appointment and uncertain of how to care for themselves or what complications to look for, suffer an increase risk of relapse and readmission. In addition to creating unnecessary patient confusion and suffering, providers have not coordinated these transitions effectively amongst themselves.

Another challenge associated with inefficient care transitions is the resulting economic costs. Although post-acute care spending in RHP 9 is substantially higher than the national average, we aren't seeing the expected outcomes, i.e. improved health, from those investments. We must develop strategies to improve care transition programs while limiting spending growth to the health system overall. UT Southwestern's ownership of home health services provides an opportunity to substantially improve patient and/or caretaker understanding of treatment regimen and illness prevention education, while allowing the patient to return to a familiar setting for post-acute medical care sooner.

5-Year expected outcome for Provider and Patients:

At present, between 3% and 4% of cancer patients are Medicaid or low-income patients. In FY2012, there were 2,009 cancer patient discharges, with 1,214 being hematology/oncology patients discharged from St. Paul Hospital. By the end of DY5, it is projected that approximately 9,000 cancer patients (DY2: ~2100, DY3: ~2200, DY4: ~2300, DY 5: ~2400) will be discharged from UTSW University Hospital. Approximately 360 of those patients will be Medicaid (DY2: ~40, DY3: ~70, DY4: ~110, DY5: ~140. Cost savings for each Medicaid avoidable readmissions range from $30,000 to $164,000.

In general, the 5-year expected outcome for UT Southwestern is primary care physician engagement, improved post-discharge processes and protocols, increased utilization of care coordinators and high quality/ highly educated non-physician practitioners, enhanced interpretation services, culturally educated providers, and coordinated care management. RHP 9 patients will enter the new primary care physician/patient-centric care continuum more seamlessly and with highly engaged providers. With timely post-discharge follow-up, problems with the patient's understanding and identification of possible complications can be quickly identified and addressed. Improved metrics will reflect the efforts through reduced cost, readmission rates, and improved quality outcomes. Finally, identifying and working with high quality network of post-acute providers that are committed to providing evidence-based care will improve quality and cost efficiency.

Patients will be actively supported by a broader array of healthcare professionals and processes to increase connections and checkpoints to confirm and stabilize and potentially improve their recovery. This program should improve the patient's understanding of care delivered, minimize unnecessary stress, and strengthen their role in recovery, creating a shared ownership of an improved health outlook. That engagement could also improve connections to lower cost channels and reduce ED intake.

Starting Point/Baseline:

Patients who have participated in the Transitional Care Services for Cancer Patients during the October 1, 2011 through September 30, 2012 timeframe (DY1) will be the baseline for the project. Data will be collected on their patient satisfaction scores, readmission rates, ED utilization.

Rationale:

There is evidence that care coordination and transitional care can reduce unplanned hospital readmissions, which are an indicator of quality of care and a source of significant wasted hospital resources and expenditures. Care coordination is defined by the Agency for Healthcare Research and Quality (AHRQ) as the "deliberate organization of patient care activities between two or more participants (including the patients) involved in a patient's care to facilitate the appropriate delivery of health care services Transitional care, which is complementary to care coordination, is "a broad range of time-limited services designed to ensure health care continuity, avoid preventable poor outcomes among at-risk populations, and promote the safe and timely transfer of patients from one level of care to another or from one type of setting to

another." Successful care coordination and transitional care programs have traditionally been implemented for medical rather than surgical patients and in settings where patients have ready access to primary care providers. Cancer care and outcomes are worst among racial/ethnic minorities and uninsured patients and at safetynet hospitals serving a disproportionate percentage of these patients. Cancer surgery at safety-net hospitals has been associated with delays, or failures, in receiving treatment (both surgical and adjuvant) and an increased risk of death. In addition, major postoperative complications and readmissions occur commonly among cancer surgery patients, both of which are associated with increased risk of death; readmission rates after complex surgery have been reported to be as high as 59% in one year. Transitions to home after cancer surgery can be difficult because of pain, decreased function and mobility, and surgery-related symptoms or complications. These transitions may be even more difficult among patients with limited social support, reduced health literacy, and unclear expectations regarding post-operative recovery.

Development of a seamless transition from an inpatient environment to an outpatient setting, possibly with the use of home health or palliative care services, or if appropriate a strategically selected alternative institutional setting, such as a high quality and cost effective LTAC or SNF is important for optimizing quality and efficiency. In addition to implementing primary care physician-centric information and care management models, we must ensure adequate metrics are identified and implemented to document and improve results for all constituencies, resulting in a decrease of readmissions and costly medical interventions.

ED visits from complications of cancer treatment are among the top 5 most expensive diagnostic categories for all payor sources, but tend to be higher for Medicaid and Uninsured populations according the RHP9 Community Needs Assessment. Potentially Preventable Readmissions for cancer patients are also among the most expense based on the same DFW Hospital Council analysis. Thus, there is good rationale and evidence to suggest that a comprehensive transitional care program would reduce readmissions and emergency room visits without increasing costs in high-risk surgical patients. The program could have other potential benefits such as: decreased patient anxiety and increased patient satisfaction; improved quality of care (and care coordination); improved access to specialty care; and reduced disparities in surgical and cancer-specific outcomes. If successful for cancer surgery patients, the program could be implemented for other high-risk surgical groups such as diabetic patients receiving lower extremity amputations.

<u>Project components:</u>

To accomplish UT Southwestern's of expanding improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings, UT Southwestern's project will meet all required project components listed below.

a) Use of discharge checklists,
b) Develop post-discharge medication planning,
c) Arrange post-op clinic visit before discharge,
d) Develop "Hand off" communication plans between providers,

e) Provide patient and family post-operative recovery education and wellness education, and

f) Conduct follow-up contact using automated flags and reminders.

For the Comprehensive Transitional Care Program for Cancer Surgery Patients Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines will be determined using DY1 data.

To progress towards this objective, UT Southwestern has selected a number of milestones and metrics that are relevant to the community needs and priorities of RHP 9.

How the project represents a new or significantly enhances an existing delivery system reform initiative:

The Transitional Care Services for Cancer Patients is a very small program when considering the entire range of patients and specialties within St. Paul University Hospital. The challenge will be to expand the program across all cancer patients, and eventually to incorporate it into the standard of care throughout the entire organization. This will require a significant amount of planning, physician and staff collaboration, additional staffing support, and the appropriate tools to track and measure progress.

Community Needs Addressed:

The specific and unique community need identification numbers that this project addresses include the following:

- CN.3: Healthcare Capacity
- CN.8: Chronic Disease
- CN.9: Specialty Care
- CN.11: Patient Safety and Quality
- CN.12: Emergency Department Usage and Readmissions
- CN-13: Palliative Care

Related Category 3 Outcome Measure(s):

OD-3 Potentially preventable Re-Admissions- 30 day Readmission Rates

IT-3.1 All cause 30 day readmission rate

Reasons/rationale for selecting the outcome measures:

With post-acute care spending in RHP 9 being substantially higher than the national average, we selected a standalone measure from the domain of potentially preventable re-admission rates. This is where we believe the impact of our project will be most measureable. Avoidable ED visits and readmissions for patients undergoing cancer care treatment are among top 5 most expensive encounter and admissions in RHP9. By reducing readmissions, the greatest impact on lowering the cost of care and raising the quality of outcomes will be measured.

Relationship to other Projects:
This project is influenced by or influences the following related projects:

- 126686802.1.7: Increase training of primary care workforce – provide CME courses to primary care providers and specialists in patient-centered medical home and chronic disease management. – this will help support the care patient receive before and after discharge.

- 126686802.1.8: Increase training of primary care workforce – train Family Medicine residents in patient centered medical home and disease management. – this will help support the care patient receive before and after discharge.

- 126686802.1.11: Expand specialty care services. – this program will help prevent avoidable ED visits by triaging and providing immediate interventions before and after hospital discharges.

- 126686802.1.12: Enhance performance improvement and reporting capacity – develop a quality improvement center. - this project support the training of staff and their efforts to improve the services they provide to patients.

- 175287501.2.1: Establish a patient care navigation program. – Establish an ED patient navigation program. – this project support better care transitions when cancer patients have an ED encounter.

- 175287501.2.2: Use of Palliative Care Programs. – supports an eliminate of transitional care.

Relationship to Other Performing Providers' Projects in the RHP: We have not seen the list of projects for Pass 2, but during Pass 1, there were two other Category 2.12 projects:

- 2.12.1 Parkland Memorial Hospital
- 2.12.2 Children's Medical Center of Dallas

Plan for Learning Collaborative: The Anchor plans to develop and facilitate Learning Collaboratives in the Region with DFW Hospital Council. UT Southwestern will participate in the Collaborative(s) as appropriate. Collaboration will be particularly important as the region seeks to document the success of primary care and primary care prevention projects across the entire population. UT Southwestern will work with Parkland and the DFW Hospital Council to document the overall impact of these initiatives.

Project Valuation:
The anchor, Parkland Health System, established six (6) criteria, to be rated based on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total

score (value weight) per project. The total score per project was divided by the percent of total DSRIP funds available for that year, arriving at a dollar value multiplier to be applied towards each project's total score (value weight). This method apportioned available funds towards those projects valued highest. UT Southwestern used this approach, with the following exceptions. First, we selected the following criteria as being most significant to differentiate between projects: (i) Transformational Impact, (ii) Population Serviced/Project Size, (iii) Aligned with Community Needs, (iv) Cost Avoidance, and (v) Sustainability. Second, we began with a 5-point scale for each criterion rated, and then doubled the score to put it on a 10-point scale. Following are the criteria, the way points were awarded for projects using the criteria:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria. Score – 1 point for each of the following: improves access; improves quality; improves costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). **This project's score for this criterion: 6.00**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected. Score - Four points for the whole population, 3 points for a relatively large population, 2 points for a moderate-sized population, and 1 point for a relatively small population. **This project's score for this criterion: 5.00**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. Score A - CNA indication: 2 points for strong support (bottom 25%), 1 point for moderate support. Score B - Severity: 3 points for issues judged to have significant impact on population health, healthcare access, and quality; 2 points for moderate severity issues. **This project's score for this criterion: 5.23**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. Score – 5 points for very low cost per person, 4 points for low cost per person, 3 points for moderate cost per person, 2 points for high cost per person, 1 point for very high cost per person. **This project's score for this criterion: 6.00**

5. Sustainability (Weight = 15%): Points were awarded based on judgment of project's sustainability relative to other projects. Score – 5 points for very sustainable, 4 points for high sustainability, 3 points for moderate sustainability, 2 points for somewhat sustainable, 1 point for low sustainability. **This project's score for this criterion: 5.35**

Total Valuation Score for this project: **5.20**

E. Category 3: Quality Improvements

Title of Outcome Measure: (Improvement Target): IT-1.7 **-** Controlling High Blood Pressure (NCQA-HEDIS, 2012, NQF 0018) (Standalone)

Unique RHP Outcome Identification Number: 195018001.3.1

Performing Provider Name: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-1.7: Controlling high blood pressure *(Standalone measure)*

- Numerator: The number of patients in the denominator whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year
- Denominator: Patients 18 to 85 years of age as of December 31 of the measurement year with a diagnosis of hypertension

As one of our primary care metrics we chose blood pressure. As high blood pressure is a prerequisite to many other chronic illnesses and serious medical conditions, getting BP under control with proper PCP supervision, medications and regular visits can help patients' quality of life and overall health.

We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes.

By the end of the waiver, our goal is to have > 50.4% (or minimum of 2.4% total improvement over baseline) of patients who are Baylor Clinic at Baylor Medical Center at Carrollton have good blood pressure control (< 140/80 mmHg). However, the actual improvement and impact that we will have on this population will be dependent on the illness severity and quantity of patients we receive in our clinic. All improvements are listed as an absolute improvement (estimated on historical performance) and relative improvement that we expect regardless of baseline. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity of Carrollton patients.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans

- DY3:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-3: Develop and Test Data Systems
    - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
  - IT-1.7: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (< 140/80 mmHg) to 47.8% (or a minimum of 1.2% improvement over baseline)
- DY5:
  - IT-1.7: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (< 140/80 mmHg) to 50.4% (or 2.4% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Our metrics and milestones are designed to increase improvement in BP control for the target population and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational.

Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED visits.[391] A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population, who make up 22.5% of the RHP 9 population[392] and 9% of the Denton County population.[393] Blood pressure is a standard metric that all Baylor Clinics monitor and regulate. Patients who are uncontrolled will receive the attention they need to get their hypertension under control.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until be realized until after DY5.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (Standalone measure)

1) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times

Unique RHP Outcome Identification Number: 195018001.3.2

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; ***(Standalone measure)***

(2) how well their doctors communicate; *(Standalone measure)*

(3) patient's rating of doctor access to specialist; *(Standalone measure)*

(4) patient's involvement in shared decision making, and *(Standalone measure)*

(5) patient's overall health status/functional status. *(Standalone measure)*

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring is to improve the satisfaction scores in regards to clinic wait times.

Establishing high patient satisfaction scores will be important at the Baylor Clinic on the Baylor Medical Center at Carrollton campus in order to ensure patients come and continue to come to the clinic to receive the care they need. We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes. All improvements are listed as an absolute improvement (estimated on historical performance) and relative improvement that we expect regardless of baseline. Improvement targets may look low. This is due to: 1)

establishment of a new clinic with no historical data and 2) uncertainty around disease severity/dissatisfaction of primary care services of Carrollton patients.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor Medical Center at Carrollton obtain a patient satisfaction score of 82.0% (or 2% improvement over established baseline) on the survey question related to wait time to appointment satisfaction. This falls under metric (1)- patients are getting timely care, appointments and information of 3.6.1, option (1).

Process Milestones:

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans
- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, setting up data collection processes, etc.

Improvement Milestones:

- DY4:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to wait times to 81.0% (or <u>minimum</u> of 1% improvement over baseline)
- DY5:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to wait times to 82.0% (or <u>minimum</u> of 2% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

The new Baylor Clinic at the Baylor Medical Center at Carrollton will not have any baseline data until patients are seen in DY4. In DY2 and DY3 we will be establishing the physical space, securing staff, resources and operations for the clinic. Until we start seeing patients in DY4, we will not know what our baseline for patient satisfaction will be. Thus we included relative improvements over baseline to account for actual improvement that will occur

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[394]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic primary care model.

1) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around improving clinic wait times for patients

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was

[394] Drain, M., & Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome, involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

2) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls

Unique RHP Outcome Identification Number: 195018001.3.3

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; *(Standalone measure)*

(2) how well their doctors communicate; ***(Standalone measure)***

(3) patient's rating of doctor access to specialist; *(Standalone measure)*

(4) patient's involvement in shared decision making, and *(Standalone measure)*

(5) patient's overall health status/functional status. *(Standalone measure)*

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring improvement in the responsiveness to patient phone calls in a timely manner.

Establishing high patient satisfaction scores will be important at the Baylor Clinic on the Baylor Medical Center at Carrollton campus in order to ensure patients come and continue to come to the clinic to receive the care they need. We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes. All improvements are listed as an absolute improvement (estimated on historical performance) and relative improvement that we expect regardless of baseline. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity/dissatisfaction of primary care services of Carrollton patients.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor Medical Center at Carrollton obtain a patient satisfaction score of 86.5% (or minimum 1.7% total improvement over established baseline) on the survey question related to patient phone calls being returned in a timely fashion. This falls under metric (2) Patients are getting timely care, appointments and information of 3.6.1, option (2).

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans.
- DY3:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-3: Develop and test data systems
    - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 85.8% (or minimum 1% improvement over established baseline)
- DY5:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 86.5% (or minimum 1.7% total improvement over established baseline)

<u>Rationale</u>

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an

ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

The new Baylor Clinic at the Baylor Medical Center at Carrollton will not have any baseline data until patients are seen in DY4. In DY2 and DY3 we will be establishing the physical space, securing staff, resources and operations for the clinic. Until we start seeing patients in DY4, we will not know what our baseline for patient satisfaction will be.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[395]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. Title of Outcome Measure (Improvement Target): IT-12.1 Breast Cancer Screening (Non-Standalone)

Unique RHP Outcome Identification Number: 195018001.3.4

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-12.1: Breast Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.
- Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded

Breast Cancer screening is a preventive measure that is part of the standard protocols and procedures for Baylor Clinic patients. Ensuring that the age appropriate and necessary screenings are completed in a timely manner help keep patients healthy. By the end of the waiver, our goal is to have > 41.3% (or a minimum of 3% total improvement over established baseline) of women ages 40-69 who are patients of the Baylor Clinic at Baylor Medical Center at Carrollton to have a breast cancer screening. We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes. All improvements are listed as an absolute improvement (estimated on historical performance) and relative improvement that we expect regardless of baseline. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity/lack of primary care services of Carrollton patients.

Process Milestones:

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans

- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
    - IT-12.1: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)
        - Our goal is increase the % of patients have had a breast cancer screen to at least 38.3% (or minimum 1.5% improvement over established baseline)
- DY5:
    - IT-12.1: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)
        - Our goal is increase the % of patients have had a breast cancer screen to at least 41.3% (or a minimum of 3% improvement over established baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

The new Baylor Clinic at the Baylor Medical Center at Carrollton will not have any baseline data until patients are seen in DY4. In DY2 and DY3 we will be establishing the physical space, securing staff, resources and operations for the clinic. Until we start seeing patients in DY4, we will not know what our baseline for breast cancer screening will be.

In Denton County, the incidence rate of breast cancer is 126.6 cases/100,000 females, much higher than the Dallas County rate of 23.7/100,000. This statistic is considered to be way higher

than the national average. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.[396]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-12.5 Other USPSTF-endorsed screening outcome measures (Non-Standalone): Influenza Vaccination Rate

Unique RHP Outcome Identification Number: 195018001.3.5

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-12.5: Other USPSTF-endorsed screening outcome measures

As part of primary care, the influenza vaccine is a simple, cost effective way for patients to protect themselves from the flu and other potential clinical exacerbations. We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses to shape our outcomes. All improvements are listed as an absolute improvement (estimated on historical performance) and relative improvement that we expect regardless of baseline. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity/lack of primary care services of Carrollton patients.

By the end of the waiver, our goal is to have > 63.9% (or minimum of 1.9% total improvement over baseline) of Baylor Clinic patients over the age of 18 receive an influenza vaccination.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans
- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 62.0% (or minimum of 1% improvement over established baseline)
- DY5:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 63.9% (or minimum of 1.9% total improvement over established baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

The new Baylor Clinic at the Baylor Medical Center at Carrollton will not have any baseline data until patients are seen in DY4. In DY2 and DY3 we will be establishing the physical space, securing staff, resources and operations for the clinic. Until we start seeing patients in DY4, we will not know what our baseline for influenza vaccinations.

In Denton County, there are 32.6 deaths/100,000 people due to influenza and pneumonia. This rate is much higher than the national average of 19.6.[397] The rate of African American age adjusted death rate due to influenza/pneumonia is 70.8 deaths/ 100,000, two times greater than the Caucasian rate in Denton County.[398] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

[397] RHP 9 Community Health Needs Assessment
[398] Healthy North Texas: www.healthyntexas.org

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 195018001.3.6

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-12.2: Cervical Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.
- Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

As part of preventive care and screenings, cervical cancer screening is a standard practice that Baylor primary care clinics provide for their patients. Education and regular exams can be the difference between early detection and death.

We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses in their preliminary years of operations to shape our outcomes.

By the end of the waiver, our goal is to have > 54.9% (or minimum improvement of 2.4% over baseline) of patients who are Baylor Clinic at Baylor Medical Center at Carrollton be screened for Cervical Cancer. However, the actual improvement and impact that we will have on this population will be dependent on the illness severity and quantity of patients we receive in our clinic.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans

- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 52.5% (or a minimum of 1.2% improvement over baseline)
- DY5:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 54.9% (or a minimum of 2.4% improvement over baseline)

As we establish the Baylor Clinic on the Baylor Medical Center at Carrollton campus, we will aim to work with both primary care and specialty care physicians to become integrated parts of the care team. We hope in DY4 and DY5 these physicians will work together in order to meet these improvement targets around cervical cancer screening, prevention and education. We feel that OB/GYNs should handle more complex cases but also use this opportunity to help educate underserved women about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

Our metrics and milestones are designed to increase improvement in Cervical Cancer screenings for the target population in Carrollton and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational.

In Region 9, the incidence rate of cervical cancer is higher than the national average. In Denton County, the incidence rate of cervical cancer is 5.9 cases per 100,000 people.[399] According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women.[400] There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a primary care setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-12.3 - Colorectal Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 195018001.3.7

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Description

IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)

- Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
- Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

As part of preventive care and screenings, colorectal cancer screening is a standard practice that Baylor primary care clinics provide for their patients. Education and regular exams can be the difference between early detection and death.

We will be monitoring these metrics closely and evaluate improvements that may need to be made. We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses in their preliminary years of operations to shape our outcomes.

By the end of the waiver, our goal is to have > 27.8% (or a minimum of 3.8% improvement over baseline) of patients who are Baylor Clinic patients at Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton be screened for Colorectal Cancer.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans
- DY3:

- P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- P-3: Develop and Test Data Systems
  - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Improvement Milestones

- DY4:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 24.0% (or minimum of 1.9% improvement over baseline)
- DY5:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 27.8% (or minimum improvement of 3.8% total over baseline)

As we establish the Baylor Clinic on the Baylor Medical Center at Carrollton campus, we will aim to work with both primary care and specialty care physicians to become integrated parts of the care team. We hope in DY4 and DY5 these physicians will work together in order to meet these improvement targets around colorectal screening, prevention and education. We feel that Gastroenterologists should handle more complex cases but also use this opportunity to help educate underserved women about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

Our metrics and milestones are designed to increase improvement in Colorectal Cancer screenings for the target population in Carrollton and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational.

In Denton County the incidence rate of colorectal cancer is 40.0 cases per 100,000. It is the second leading cause of cancer related deaths in the US and as many as 60% of the deaths from

colorectal cancer could be avoided with regular screening tests.[401] There is a definite need for these services in Denton County and the Baylor Clinic plans to provide these screenings to a greater number of people. There is greater need for patients to receive (appropriate) sigmoidoscopies/ colonoscopies in the region as a preventive measure. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.[402] There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Denton County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): Diabetes Care: HbA1c poor control (> 9.0%)- NQF 0059 (Standalone measure)

Unique RHP Outcome Identification Number: 195018001.3.8

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center of Carrollton/195018001

Outcome Measure Description

IT-1.10 Diabetes care: *HbA1c poor control (>9.0%) (Standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

The Baylor Clinic on the Baylor Medical Center at Carrollton is planned to be operational by DY4. While we expect some clinical improvement in patients who will enroll in the chronic disease management program, we will not know the potential of this until patients are seen in the clinic and enrolled in the program for at least 6 months. We have based our HbA1c projections on a similar Baylor Clinic on another campus. We may need to modify these metrics and outcomes once the clinic is operational in DY4.

By the end of the waiver, our goal is to have < 22.6% (or minimum of 1.2% improvement over established baseline) of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. The additional qualifiers for this metric are the following: 1) a patient has been engaged in chronic care management for at least 6 months, 2) Two HbA1c measures will be taken per patient and the most recent HbA1c score will be used for reporting. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity of Carrollton patients.

One of the outcome measures we have chosen for our chronic care management program is HbA1c performance, as determined by a reduction in poor control, defined as the percent of the population with HbA1c > 9.0%.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans
- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Outcome Improvement Targets for each year

- DY4:
    - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
        - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 23.8% (or minimum improvement of 0.6% over established baseline)
- DY5:
    - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
        - Our end goal is to the HbA1c > 9.0% rate to ≤ 22.6% (or minimum improvement of 1.2% over established baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Our metrics and milestones are designed to increase improvement in chronic disease management participation for the target population in Carrollton and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational.

In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes.[403] This equates to 78,000 people in Denton County.[404] Traditionally, the underserved population does not have access to the necessary medications and supplies to manage their diabetes thus many patients go undiagnosed or have poor glucose control. Lack of proper education coupled with a lack of primary care attention often leads to more severe complications and poor health outcomes for those with diabetes. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions.

Bodenheimer, et. al, found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients.[405] A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[406]. Focusing efforts on improving glycemic control should result in reduced co-morbid conditions and improved complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-1.11 Diabetes Care: BP control (<140/80 mmHg) NQF 0061 (Standalone measure)

Unique RHP Outcome Identification Number: 195018001.3.9

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center of Carrollton/195018001

Outcome Measure Description

IT-1.11 Diabetes care: *BP control (<140/80mm Hg)- (Standalone measure)*

- Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

The Baylor Clinic on the Baylor Medical Center at Carrollton is planned to be operational by DY4. While we expect some clinical improvement in patients who will enroll in the chronic disease management program, we will not know the potential of this until patients are seen in the clinic and enrolled in the program for at least 6 months. We have based our BP control projections on a similar Baylor Clinic on another campus. We may need to modify these metrics and outcomes once the clinic is operational in DY4.

By the end of the waiver, our goal is to have > 55.7% (or minimum of 2.3% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) under BP control (< 140/80 mmHg). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program for at least 6 months. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity of Carrollton patients.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans

- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Outcome Improvement Targets for each year

- DY4:
    - Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 53.4% (or minimum of 1.2% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program
- DY5:
    - Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 55.7% (or minimum of 2.3% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Our metrics and milestones are designed to increase improvement in chronic disease management participation for the target population in Carrollton and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational. We have historically tracked BP control as < 130/80 mmHg and will modify this as we build the data tracking systems for Baylor Carrollton.

As part of the standard of care for diabetes management, optimal blood pressure control is an included component of this protocol. At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic

patients[407]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-1.13 - Diabetes Care: Diabetes care: Foot exam- NQF 0056

Unique RHP Outcome Identification Number: 195018001.3.10

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center of Carrollton/195018001

Outcome Measure Description

IT-1.13 Diabetes care *Foot exam- (Non- standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).
-

The Baylor Clinic on the Baylor Medical Center at Carrollton is planned to be operational by DY4. While we expect some clinical improvement in patients who will enroll in the chronic disease management program, we will not know the potential of this until patients are seen in the clinic and enrolled in the program for at least 6 months. We have based our foot examination projections on a similar Baylor Clinic on another campus. We may need to modify these metrics and outcomes once the clinic is operational in DY4.

By the end of the waiver, our goal is to have > 96.8% (or a minimum of 1.8% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) receive a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year(s). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. Improvement targets may look low. This is due to: 1) establishment of a new clinic with no historical data and 2) uncertainty around disease severity of Carrollton patients.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans

- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Outcome Improvement Targets for each year

- DY4
    - IT-1.13: Diabetes Care: Foot exam
        - Our goal is to increase this rate to at least 96.4% of diabetic patients receiving a foot exam (or a minimum of 1% improvement over baseline)
- DY5:
    - IT-1.13: Diabetes Care: Foot exam
        - Our goal is to increase this rate to at least 96.8% of diabetic patients receiving a foot exam (or a minimum of 1.8% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

Our metrics and milestones are designed to increase improvement in chronic disease management participation for the target population in Carrollton and are based off historical performance of a similar Baylor Clinic. Actual performance and improvement will not be determined until DY4, when the clinic is operational.

An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and

other complex issues. This is better utilization and management of resources through early identification and prevention of serious diabetes foot related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation.[408]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.
For this particular project, we also accounted for the fact that Category 3 outcomes will not begin until DY4 and because this clinic will be a new endeavor, the clinical impact may not be fully realized until beyond DY5.

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Percent of Opportunities Achieved

Unique RHP Outcome Identification Number: 195018001.3.11

Performing Provider Name/TPI: Trinity MC, LLC d/b/a Baylor Medical Center at Carrollton/ 195018001

Outcome Measure Description

The disparity group for this metric is the underserved/uninsured population in Denton County that has uncontrolled Asthma.

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of asthma opportunities completed/fulfilled
- Denominator: Asthma appropriate opportunities x number of asthma patients

By the end of the waiver, our goal is to have achieved a 30.0% (or 10% improvement over baseline) percent of opportunities achieved for the Baylor Health Care System Asthma Percent of Opportunity Achieved (POA).

At Baylor Health Care System, we have a standard Asthma POA which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate POA by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population.

POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period.

For an illustrative example: For Asthma- there are 4 potential opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy

for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

We do not have a baseline for these metrics and have relied on historical performance and improvement opportunities of other Baylor Clinics on other Baylor campuses in their preliminary years of operations to shape our outcomes.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will engage in project planning- we will engage stakeholders, identify current capacity and needed resources. We will determine timelines and document implementation plans
- DY3:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Develop and Test Data Systems
        - We will continue to engage in project planning and operationalize the clinic through hiring staff, securing capital expenditures, setting up data collection processes, etc.

Outcome Improvement Targets for each year

- DY4:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 25% (or 5% improvement over baseline)
- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 30% (or 10% total improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Pulmonologists should handle more complex cases but also use this opportunity to help educate the underserved population (especially Hispanics and African Americans) about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

We plan on measuring the improvement in Asthma for Baylor Clinic patients. At Baylor Health Care System, we have a standard Asthma Percent of Opportunities Achieved which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We feel that this measure is a comprehensive way to measure the patients with Asthma in the Baylor Clinic and manage their condition holistically.

Asthma affects about 19.6% of the Dallas County population and had approximately 1158 cases of hospitalization in 2010.[409] According to the Office of Minority Health, African Americans were 30% more likely to have Asthma than non-Hispanic whites and were three times more likely to die from an Asthma related issue than non-Hispanic whites. Hispanics are 30% more likely to visit the hospital for Asthma than non-Hispanic whites.[410]

A study by Meng, Leung, et. al found that patients with Asthma that saw a specialist had higher rates of compliance because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients leading to better quality outcomes and long(er) term control[411]. Making the pulmonologist a part of our Asthma patients' care team will help to avoid exacerbations, prevent complications and reduce hospitalizations.

Many of the underserved patients in the region require specialty care related to chronic diseases. Lack of timely access to needed care often results in clinical exacerbations and worsening of their health conditions. This can be avoided or lessened through improved access. A study conducted in 2010 by Bellinger, et al. confirmed that minority and underserved

[409] Healthy People North Texas: http://www.healthyntexas.org

populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.[412]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS, 2012,NQF 0018) **(Standalone)**

Unique RHP Outcome Identification Number: 121790303.3.1

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-1.7: Controlling high blood pressure *(Standalone measure)*

- Numerator: The number of patients in the denominator whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year
- Denominator: Patients 18 to 85 years of age as of December 31 of the measurement year with a diagnosis of hypertension

As one of our primary care metrics we chose blood pressure. As high blood pressure is a prerequisite to many other chronic illnesses and serious medical conditions, getting BP under control with proper PCP supervision, medications and regular visits can help patients' quality of life and overall health.

By the end of the waiver, our goal is to have > 54.8% (or a total of 7.5% improvement over baseline)of patients who are patients of the Baylor Clinics at Baylor Medical Center at Garland to have good blood pressure control (< 140/80 mmHg). This is an improvement of 7.5% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. Baylor currently tracks BP control and uses a threshold of <130/80 mmHg for patients that have hypertension. Based on our current data, 47.3% of patients with hypertension have controlled BP (130/80 mmHg)

Improvement Milestones

- DY3:
  - IT-1.7: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (140/80 mmHg) to 49.9% (or 2.6% improvement over established baseline)
- DY4:
  - IT-1.7: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone). Our goal is increase the % of patients that have BP control (140/80 mmHg) to 52.4% (or 5.1% improvement over established baseline)
- DY5:
  - IT-1.7: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone). Our goal is increase the % of patients that have BP control (140/80 mmHg) to 54.8% (or 7.5% improvement over established baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED visits.[413] A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population, who make up 22.5% of the RHP 9 population[414] and 14.5% of the Garland population.[415] Blood pressure is a standard metric that all Baylor Clinics monitor and regulate. Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education

about their illness in this clinic PCMH setting. Our metrics and milestones are designed to increase improvement in BP control for the target population.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

1) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times

Unique RHP Outcome Identification Number: 121790303.3.2

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; *(Standalone measure)*
(2) how well their doctors communicate; *(Standalone measure)*
(3) patient's rating of doctor access to specialist; *(Standalone measure)*
(4) patient's involvement in shared decision making, and *(Standalone measure)*
(5) patient's overall health status/functional status. *(Standalone measure)*

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring is to improve the satisfaction scores in regards to clinic wait times. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic

By the end of the waiver, our goal is to have the patients at Baylor Clinics on the Baylor Medical Center at Garland campus to attain a patient satisfaction score of 88.7% on the survey question related to wait time to appointment satisfaction. This falls under metric (1)- patients are getting timely care, appointments and information of 3.6.1, option (1). Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Although the Baylor Clinic at Baylor Medical Center at Garland is at a 86th percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 86.8% is equivalent to a 72 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Process Milestones:

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. Currently, the Baylor Clinics at Baylor Medical Center at Garland are at 86.8% satisfaction with clinic wait times

Improvement Milestones:

- DY3:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to wait times to 87.5% (or 0.7% improvement over baseline)
- DY4:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to wait times to 88.1% (or1.3% improvement over baseline)
- DY5:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to wait times to 88.7% (or 1.9% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[416]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an

[416] Drain, M., & Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

1) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around improving clinic wait times for patients

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

2) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls

Unique RHP Outcome Identification Number : 121790303.3.3

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; *(Standalone measure)*
(2) how well their doctors communicate; ***(Standalone measure)***
(3) patient's rating of doctor access to specialist; *(Standalone measure)*
(4) patient's involvement in shared decision making, and *(Standalone measure)*
(5) patient's overall health status/functional status. *(Standalone measure)*

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring improvement in the responsiveness to patient phone calls in a timely manner.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor Medical Center at Garland obtain a patient satisfaction score of 91.7% on the survey question related to patient phone calls being returned in a timely fashion. This falls under metric (2) Patients are getting timely care, appointments and information of 3.6.1, option (2). Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Although the Baylor Clinic at Baylor Medical Center at Garland is at a 90th percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 90.3% is equivalent to a 83 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. Currently, the Baylor Clinics at Baylor Medical Center at Garland are at 90.3% satisfaction with patients receiving a response to their phone calls in a timely manner

Improvement Milestones

- DY3:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 90.8% (or minimum of 0.5% improvement over baseline)
- DY4:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 91.3% (or minimum of 1% improvement over baseline)
- DY5:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 91.7% (or minimum of 1.4% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their

disease[417]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

2) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around response times to patient phone calls

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.1 Breast Cancer Screening (Non-Standalone)

Unique RHP Outcome Identification Number: 121790303.3.4

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-12.1: Breast Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.
- Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded

By the end of the waiver, our goal is to have > 46.7% of women ages 40-69 (or 8.9% improvement over baseline) who are patients of the Baylor Clinics at Baylor Medical Center at Garland to have a breast cancer screening. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones:

DY2:

[P-1]: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

We will confirm and establish our baseline. The Baylor Clinic at Baylor Medical Center at Garland is at a 37.8% screening rate for women between 40-69 years old

Improvement Milestones

DY3:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 40.9% (or 3.1% improvement over baseline)

DY4:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 43.9% (or 6.1% improvement over baseline)

DY5:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 46.7% (or 8.9% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, 23.7/100,000 women die from breast cancer, with a higher rate of 37/100,000 for African American women.[418] According to the Healthy North Texas community dashboard, 76.1% of women in the Dallas-Plano-Irving areas received a mammogram, leaving opportunities to increase this rate for the underserved population. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.

Title of Outcome Measure (Improvement Target): IT-12.5 Other USPSTF-endorsed screening outcome measures (Non-Standalone): Influenza Vaccination Rate

Unique RHP Outcome Identification Number: 121790303.3.5

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-12.5: Other USPSTF-endorsed screening outcome measures

As part of primary care, the influenza vaccine is a simple, cost effective way for patients to protect themselves from the flue and other potential clinical exacerbations.

By the end of the waiver, our goal is to have > 66.6% (or 5.5% improvement over baseline) of patients of Baylor Clinic patients over the age of 18 receive an influenza vaccination. This is an improvement of 5.5% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

We will confirm and establish our baseline. The Baylor Clinics at Baylor Medical Center at Garland are at a 61.1% rate for patients over the age of 18 that have received influenza vaccine in past 12 months

Improvement Milestones

DY3:

IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)

Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 63.0% (or 1.9% improvement over baseline)

DY4:

IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)

Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 64.9% (or 3.8% improvement

DY5:

IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)

Our goal is increase the % of >18 years old that have had an influenza vaccination in the past 12 months to 66.6% (or 5.5% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months.[419] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Metrics

Unique RHP Outcome Identification Number: 121790303.3.6

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of asthma opportunities completed/fulfilled
- Denominator: Asthma appropriate opportunities x number of asthma patients

The disparity group for this metric is the underserved/uninsured population in Dallas County that has uncontrolled Asthma.

By the end of the waiver, our goal is to have achieved a 76.9% (or 3.9% improvement over baseline) percent of opportunities achieved for the Baylor Health Care System Asthma Percent of Opportunity Achieved (POA. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

At Baylor Health Care System, we have a standard Asthma POA which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate POA by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population.

POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period.

For an illustrative example: For Asthma- there are 4 opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10%

improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 73% POA was achieved for Asthma patients

Improvement Milestones

- DY3:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 74.4% (or 1.4% improvement over baseline)
- DY4:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 75.6% (or 2.5% improvement over baseline)
- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 76.9% (or 3.9% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Pulmonologists should handle more complex cases but also use this opportunity to help educate the underserved population (especially Hispanics and African Americans) about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

We plan on measuring the improvement in Asthma for Baylor Clinic patients. At Baylor Health Care System, we have a standard Asthma Percent of Opportunities Achieved which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We feel that this measure is a comprehensive

way to measure the patients with Asthma in the Baylor Clinic and manage their condition holistically.

Asthma affects about 19.6% of the Dallas County population and had approximately 1158 cases of hospitalization in 2010.[420] According to the Office of Minority Health, African Americans were 30% more likely to have Asthma than non-Hispanic whites and were three times more likely to die from an Asthma related issue than non-Hispanic whites. African Americans make up 14.5 % of the Garland population.[421] Hispanics are 30% more likely to visit the hospital for Asthma than non-Hispanic whites.[422] Hispanics comprise 37.8% of the Garland population.[423]

A study by Meng, Leung, et. al found that patients with Asthma that saw a specialist had higher rates of compliance because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients leading to better quality outcomes and long(er) term control[424]. Making the pulmonologist a part of our Asthma patients' care team will help to avoid exacerbations, prevent complications and reduce hospitalizations.

Many of the underserved patients in the region require specialty care related to chronic diseases. Lack of timely access to this needed care, often results in clinical exacerbations and worsening of their health conditions that can be avoided or lessened through improved access. A study conducted in 2010 by Bellinger, et. al confirmed that minority and underserved populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.[425]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add outcome amounts over DYs 2-5):* $ 178,038			

Title of Outcome Measure (Improvement Target): IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 121790303.3.7

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-12.2: Cervical Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.
- Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

As part of preventive care and screenings, cervical cancer screening is a standard practice that PCP/PCMHs provide for their patients. Education and regular exams can be the difference between early detection and death. By the end of the waiver, our goal is to have > 59.1% (or 6.8% improvement over baseline) of patients who are Baylor Clinic at Baylor Medical Center at Garland be screened for Cervical Cancer. This is a 6.8% improvement over baseline.
Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 52.3% of patients at the Baylor Clinic at Baylor Medical Center at Garland have had a Cervical Cancer screening

Outcome Improvement Milestones

- DY3:
  - IT-12.2: Cervical Cancer Screening
    - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 54.7% (or 2.4% improvement over baseline)
- DY4:
  - IT-12.2: Cervical Cancer Screening
    - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 57.0% (or 5.3% improvement over baseline)

- DY5:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 59.1% (or 6.8% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that OB/GYNs should handle more complex cases but also use this opportunity to help educate underserved women in Garland about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period

In Dallas County approximately the incidence rate of cervical cancer is 9.7 per 100,000.[426] According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women.[427] In Garland, the African American population comprises 14.5% of the population, and Hispanics comprise 37.8%.[428] There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a PCP/PCMH setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 121790303.3.8

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description

IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)

- Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
- Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

By the end of the waiver, our goal is to have > 43.0% (or 9.5% improvement over baseline) of patients who are Baylor Clinic patients at Baylor Medical Center at Garland be screened for Colorectal Cancer. This is an improvement of 9.5% over baseline. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that only 33.5% of patients at Baylor Clinic at Baylor Medical Center at Garland have had a Colorectal Cancer Screening

Improvement Milestones

- DY3:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 36.8% (or 3.3% improvement over baseline)
- DY4:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 40.0% (or 6.5% improvement over baseline)
- DY5:

- IT-12.3 Colorectal Cancer Screening
  - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 43.0% (or 9.5% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Gastroenterologists should handle more complex cases but also use this opportunity to help educate underserved adults about the importance of screenings and prevention. The Baylor Clinic is currently only at a 33% completion rate and will need the help of their specialist partners to meet these goals.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period

In Dallas County less than 60% of individuals 50 and over have had a sigmoidoscopy or colonoscopy examination. The colorectal cancer incidence rate is 43.3 cases per 100,000 people. 60% of deaths due to colorectal cancer can be avoided.[429] There is a definite need for these services in Dallas County and the Baylor Clinic plans to provide these screenings to a greater number of people. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.[430] In Garland, African Americans comprise 14.5% of the population and Hispanics, 37.8%.[431] There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes Care: HbA1c poor control (> 9.0%)- NQF 0059 (Standalone measure)

Unique RHP Outcome Identification Number: 121790303.3.9

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-1.10 Diabetes care: *HbA1c poor control (>9.0%) (Standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have < 10.9% (or minimum reduction of 1.8% over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. The additional qualifiers for this metric are the following: 1) a patient has been engaged in chronic care management for at least 6 months, 2) Two HbA1c measures will be taken per patient and the most recent HbA1c score will be used for reporting.

One of the outcome measures we have chosen for our chronic care management program is HbA1c performance, as determined by a reduction in poor control, defined as the percent of the population with HbA1c > 9.0%. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

P-2: Establish Baseline Rate

We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 12.7% of patients at the Baylor Clinic at Baylor Medical Center at Garland have an HbA1c > 9.0% Improvement Milestones

Outcome Improvement Targets for each year

DY3:

IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
Our goal is to reduce the HbA1c > 9.0% rate to ≤ 12.1% (or 0.6% reduction over baseline)

DY4:

IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
Our goal is to reduce the HbA1c > 9.0% rate to ≤ 11.5% (or 1.2% reduction over baseline)

DY5:

IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
Our end goal is to have the HbA1c > 9.0% rate be ≤ 10.9% (or 1.8% reduction over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes.[432] Traditionally, the underserved population in Garland does not have access to the necessary medications and supplies to manage their diabetes thus many patients go undiagnosed or have poor glucose control. Lack of proper education coupled with a lack of primary care attention often leads to more severe complications and poor health outcomes for those with diabetes. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions.

Bodenheimer, et. al, found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients.[433] A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[434]. Focusing efforts on improving glycemic control should result in reduced co-morbid conditions and improved complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

Title of Outcome Measure (Improvement Target): IT-1.11 Diabetes Care: BP control (<140/80 mmHg) NQF 0061 (Standalone measure)

Unique RHP Outcome Identification Number: 121790303.3.10

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-1.11 Diabetes care: *BP control (<140/80mm Hg)- (Standalone measure)*

- Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have > 54.9% (or 7.5% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) under BP control (< 140/80 mmHg). This is a 7.5% improvement over baseline. This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program for at least 6 months. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish Baseline Rates
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 47.4% of patients with diabetes at the Baylor Clinic at Baylor Medical Center at Garland have BP less than 130/80 mmHg. At Baylor Medical Center at Garland Medical Center, we have been historically defining uncontrolled BP > 130/80 mmHg, we will have to adjust our tracking for this project.

Outcome Improvement Targets for each year

DY3:

IT-1.11: Diabetes Care: BP control (<140/80 mmHg)

Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 50.0% (or 2.6% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

DY4:

IT-1.11: Diabetes Care: BP control (<140/80 mmHg)

Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 52.5% (or 5.1% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

DY5:

IT-1.11: Diabetes Care: BP control (<140/80 mmHg)

Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 54.9% (or 7.5% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

We will have to review our baseline numbers in DY2. Historically, in our E.H.R we have been tracking BP control as < 130/80 mmHg. In order to meet the requirements of this project, we will have to re-analyze the numbers and re-establish our new baseline.

As part of the standard of care for diabetes management, optimal blood pressure control is an included component of this protocol. At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[435]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome

[435] Cushman WC, Evans, GW, et. al Effects of intensive blood pressure control in type 2 diabetes mellitus. N Engl J Med. 2010. Apr 29; 362(17): 1575-85

,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.13 Diabetes Care: Diabetes care: Foot exam- NQF 0056

Unique RHP Outcome Identification Number: 121790303.3.11

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-1.13 Diabetes care *Foot exam- (Non- standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

By the end of the waiver, our goal is to have > 96.8% (or a minimum of 1.2% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) receive a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year(s). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

P-2: Establish Baseline Rates

We will confirm and establish our baseline. A preliminary E.H.R data analysis shows 95.6% of diabetic patients that are seen by a diabetes educator at the Baylor Clinic at Baylor Medical Center at Garland receive a foot exam

Outcome Improvement Targets for each year

DY3:

IT-1.13: Diabetes Care: Foot exam

Our goal is to increase this rate to at least 96.0% (or a minimum of 0.4% improvement over baseline) of diabetic patients receiving a foot exam

DY4:

IT-1.13: Diabetes Care: Foot exam

Our goal is to increase this rate to at least 96.4% (or a minimum of 0.8% improvement over baseline) of diabetic patients receiving a foot exam

DY5:

IT-1.13: Diabetes Care: Foot exam

Our goal is to increase this rate to at least 96.8% (or a minimum of 1.2% improvement over baseline) of diabetic patients receiving a foot exam

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues. This is better utilization and management of resources through early identification and prevention of serious diabetes foot related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation.[436]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in Identified Disparity Group. Clinical indicator to be improved and disparity group to be determined by provider.

Unique RHP Outcome Identification Number: 121790303.3.12

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
- Denominator: Total number of patients with a Behavioral Health intervention/
- encounter

One of the outcome measures we have chosen for our behavioral health program is to improve Baylor's standard diabetes Percent of Opportunities Achieved (POA) which consists of HbA1c, LDL, BP control for patients who have engaged in our behavioral health program. POA is similar in nature to an improvement bundle, but differs slightly in the way it is calculated. Here, we define the disparate population as the underserved individuals in Dallas County (Garland) that have both a diagnosis of diabetes and a behavioral health issue.

By the end of the waiver, our goal is to have > 15% of patients who have had a behavioral health intervention/encounter to have improvement in our Diabetes POA (HbA1c, LDL, BP, etc) that have uncontrolled values for these measures and have an identified behavioral health issue.

- HbA1c < 8%
- LDL < 100
- BP < 130/80 mmHg

Baylor's standard diabetes POA is measured by using percent of opportunities achieved (POA). We plan on measuring the improvement in Diabetes for Baylor Clinic patients that receive behavioral health treatment. The Diabetes POA which consists of: LDL, BP and HbA1c control is measured yearly for our diabetic patients. The POA is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their diabetes patients than in the prior reporting period.

For an illustrative example: For Diabetes- there are 3 opportunities (i.e. metrics) per patient (1) A1c < 8, 2) LDL < 100, 3) BP < 130/80 mmHg). The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 77% achievement. We define this outcome in the following way:

Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter

Denominator: Total number of patients with a Behavioral Health intervention/ encounter

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3-2: Establish Baseline Rates
        - We will establish a baseline of current status of the Diabetes POA for patients that have a reported behavioral health issue
- DY3:
    - P-3-2: Establish Baseline Rates
        - We will compare the DY2 baseline rate to results in DY3 to measure change refine data collection processes if necessary

Outcome Improvement Targets for each year

- DY3:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
        - We will improve the Diabetes POA for 5% of patients who have had at least one behavioral health intervention/encounter in one year
- DY4:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
        - We will improve the Diabetes POA for 10% of patients who have had at least one behavioral health intervention/encounter in one year
- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients
        - We will improve the Diabetes POA for 15% of patients who have had at least one behavioral health intervention/encounter in one year

Rationale

Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to recognize and increase awareness of patients who have co-occurring behavioral health and diabetes health issues. By recognizing this, we believe we can positively impact diabetes outcomes by addressing underlying behavioral health issues that patients may have.

In DY2, we will collect our baseline information about the status of the Diabetes Metrics (HbA1c, LDL, BP) for patients who have a documented behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.
In Region 9, there is a 36% increase in average charges per encounter for those individuals with a co-occurring behavioral health issue and chronic disease. 100% of the frequent flyers had a co-occurring mental illness and cost the Region over $26 million dollars.[437]

A recent study conducted in early 2012, by Jeffery Johnson, et. al showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression. Depression is associated with poorer self care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases[438].

Title of Outcome Measure (Improvement Target): IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. (**Non-standalone measure**)

Unique RHP Outcome Identification Number: 121790303.3.13

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. *(Non-standalone measure)*

- Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
- Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

One of the outcome measures we have chosen for our behavioral health program is to increase the number of patients in the underserved population who have improved utilization rates for receiving behavioral health treatments/interventions. The subset of the target population that suffers from mental health issues is prevalent in the region. Only 19.8% of underserved patients receive behavioral treatment in the same setting as their primary care[439]. The disparate population that we will be focusing on is the underserved/uninsured patients in Dallas County (Garland) with behavioral health needs.

By the end of the waiver, our goal is to have > 20% of patients who are eligible to participate in the behavioral health program, engage in the program.

We define this outcome in the following way:

Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure is different than the Improvement Milestone we proposed in our

[439] RHP 9 Community Health Needs Assessment

Category 2 Project Table because Outcome Measure 11.3 focuses on utilization of the behavioral health service, entailing that an "engaged" patient is one that has had at least two behavioral health encounters/interventions in the past 12 months. The Improvement Milestone in the project table is a volume metric focused on enrolling the patient in a Behavioral Health program. This Outcome Measure takes this one step further by requiring at least two visits in the past 12 months.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will establish a baseline of how many patients have a behavioral health issue (substance abuse, anxiety, depression, other) based on our E.H.R, self-reported or clinician reported status.
- DY3:
  - P-2: Establish Baseline Rates
    - We will compare our DY2 baseline analysis to DY3 to determine if any improvements need to be made to the data collection process and to capture any variances between the two data sets

Outcome Improvement Targets for each year

- DY3:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 10%
- DY4:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 15%
- DY5:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 20%

Rationale

Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to demonstrate increased access and utilization of the behavioral health program we are proposing.

In DY2, we will collect our baseline information about the number of patients who have a behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-5.1 Improved Cost Savings: Demonstrate cost savings in care delivery (Non-**Standalone measure**)

Unique RHP Outcome Identification Number: 121790303.3.14

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Measure Description

IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (*Standalone measure for Project 2.5 only. For all other projects –Non- standalone measure)*

- Type of analysis to be determine by provider from the following list: Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis

By the end of the waiver, our goal is to have > 30% cost savings in health care services utilization (through fewer ED visits and less overall utilization) for patients who have engaged in our care navigation program and have a confirmed appointment with a PCP/PCMH.

One of the outcome measures we have chosen for our care navigation program is to improve cost savings in the healthcare delivery system for those patients that have been served by the care navigation program.

Process Milestones

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

P-2: Establish Baseline Rates

In DY2 we will establish a baseline of average cost savings incurred by patients who have been seen by the care navigation program while in the ED and have a confirmed appointment with a PCP/PCMH. We will compare pre and post utilization patterns of enrolled patients to determine the total cost savings incurred (inpatient and outpatient) per patient. For example, if prior to being seen by our care navigation program, a patient's total cost utilization was $10,000 we anticipate that after being connected to the appropriate resource and being seen for an appointment that over the course of 1 year, total costs would decrease by 20% (DY4) to $8,000.

Outcome Improvement Targets for each year

DY3:

IT-5.2: Improved Cost Savings

We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 15% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year

DY4:

IT-5.2: Improved Cost Savings

We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 20% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year

DY5:

IT-5.2: Improved Cost Savings

We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 25% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year

Rationale

In DY2, we plan to do some in depth utilization analysis to determine a baseline of what the cost utilization patterns are for patients seen at Baylor Medical Center at Garland. This, based on our historical experience with similar programs on other campuses, we anticipate a 15%, 20% and 25% cost savings over the subsequent years in total cost of care savings.

The reason we chose this metric is because financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[440]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region.

[440] Texas Medical Association: http://www.texmed.org

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization (**Standalone measure**)

Unique RHP Outcome Identification Number: 121790303.3.15

Performing Provider Name/TPI: Baylor Medical Center of Garland/121790303

Outcome Description

IT-9.2 ED appropriate utilization *(Standalone measure)*

- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-N/A
- Reduce Emergency Department visits for target conditions
    - Congestive Heart Failure
    - Diabetes
    - End Stage Renal Disease
    - Cardiovascular Disease/Hypertension
    - Behavioral Health/Substance Abuse
    - Chronic Obstructive Pulmonary Disease
    - Asthma

By the end of the waiver, our goal is to have > 35% reduction in inappropriate ED utilization for all causes and > 20% reduction in inappropriate ED utilization for targeted conditions: CHF, Diabetes, ESRD, CVD/Hypertension, Behavioral Health/Substance Abuse, COPD and Asthma

One of the outcome measures we have chosen for our care navigation program is to reduce ED utilization. The protocol mentions three parts to this metric:

1) Reduce all ED visits (including ACSC)
2) Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-*we will not be measuring this outcome as we do not see pediatric patients at Baylor University Medical Center*
3) Reduce ED visits for target conditions
    a. CHF
    b. Diabetes
    c. ESRD
    d. CVD/Hypertension
    e. Behavioral Health/Substance Abuse
    f. COPD
    g. Asthma

Process Milestones

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

P-3: Establish Baseline Rates

We will establish a baseline for the aforementioned components of the improvement metric (less #2- pediatric ED visits) and determine the full opportunity for improvement

DY3:

P-3 Establish Baseline Rates

We will conduct a comparison between DY2 and DY3 to determine the change in rates for ED utilization and utilization of targeted conditions and determine any seasonality or variations in data collection/trends

Improvement Milestones

DY3:

IT-9.2: ED Appropriate Utilization

We aim to reduce all ED visits by 25% and ED visits for targeted conditions by 10%

DY4:

IT-9.2: ED Appropriate Utilization

We aim to reduce all ED visits by 30% and ED visits for targeted conditions by 15%

DY5:

IT-9.2: ED Appropriate Utilization

We aim to reduce all ED visits by 35% and ED visits for targeted conditions by 20%

Rationale

Baylor Medical Center at Garland sees very few children, thus metric 2 is not applicable to this project. We do not see enough pediatric patients to make a material impact on the ED utilization rate for this population. Historically, we have not tracked the ED utilization for targeted conditions (i.e. CHF, Diabetes, etc), for this type of project thus we do not have a baseline measurement for these specific diseases. We plan to measure these in DY2 and DY3 and target a modest improvement of ED utilization in the subsequent years.

According to the Community Health Needs Assessment of Region 9, 68% of ED visits were preventable/treatable in an outpatient setting[441]. The stakeholder survey conducted amongst

[441] RHP 9 Community Health Needs Assessment

performing providers also indicated that there is a significant overuse of emergency department services due to patients' inability to access primary care. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues[442]. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life
Unique RHP Outcome Identification Number: 121790303.3.16
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-10.1: Quality of Life *(Standalone measure)*

Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Quality of Life tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. We do not currently utilize Quality of Life surveys. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that that Quality of Life indicators such as depression and cognition exams improve over time with home visits.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.
- DY4:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for

patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.

- DY5:
  - IT-1.10: Quality of Life (Standalone)
    - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[443] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living
Unique RHP Outcome Identification Number: 121790303.3.17
Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-10.2: Activities of Daily Living *(Standalone measure)*

Demonstrate improvement in ADL scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Activities of Daily Living tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that ADL improvement in the elderly population improves where patients go from partial dependence to independence.

Outcome Improvement Targets for each year

- DY3:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.
- DY4:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living

assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.

- DY5:
  - IT-10.2: Activities of Daily Living *(Standalone measure)*
    - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[444] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or barriers that patients may be experiencing.[445] We may need to consider using the Lawton IADL scale for this population as it involves more complex activities such as: shopping, laundry, responsibility for own medications, etc.[446] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Title of Outcome Measure (Improvement Target): IT-1.2 Annual monitoring for patients on persistent medication– angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)
Unique RHP Outcome Identification Number: 121790303.3.18

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-1.2: Annual monitoring for patients on persistent medications angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)
Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.
Percentage of members 18 years of age and older who received at least 180 treatment days of ACE inhibitors or ARBs during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on an ACE/ARB

inhibitor. We do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to anti-hypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[447] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or

[447] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.4 Annual monitoring for patients on persistent medications diuretic *(Non- standalone measure)*

Unique RHP Outcome Identification Number: 121790303.3.19

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-1.4: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) diuretic *(Non- standalone measure)*
Percentage of members 18 years of age and older who received at least 180 treatment days of a diuretic during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on a diuretic. We do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[448]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Title of Outcome Measure (Improvement Target): IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant *(Non- standalone measure)*

Unique RHP Outcome Identification Number: 121790303.3.20

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-1.5: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) anticonvulsant *(Non- standalone measure)*
Percentage of members 18 years of age and older who received at least 180 treatment days for an anticonvulsant during the measurement year and had at least one drug serum concentration level monitoring test for the prescribed drug in the measurement year.

Since we do not have a baseline for patients receiving a serum concentration test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% of patients on an anticonvulsant are receiving a serum concentration test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 5% of patients in Baylor Clinics are on an anticonvulsant. We do not have any data on how many of those patients received a serum test in the past year.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[449] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add outcome amounts over DYs 2-5):* $55,319

Title of Outcome Measure (Improvement Target): IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant *(Non- standalone measure)*
Unique RHP Outcome Identification Number: 121776204.3.20

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-1.5: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) anticonvulsant *(Non- standalone measure)*
Percentage of members 18 years of age and older who received at least 180 treatment days for an anticonvulsant during the measurement year and had at least one drug serum concentration level monitoring test for the prescribed drug in the measurement year.

Since we do not have a baseline for patients receiving a serum concentration test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% of patients on an anticonvulsant are receiving a serum concentration test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 5% of patients in Baylor Clinics are on an anticonvulsant. We do not have any data on how many of those patients received a serum test in the past year.

Outcome Improvement Targets for each year

- DY3:

- IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum concentration test in the past year to 2% or 5% depending on baseline established in DY2

- DY4:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 4%, 5% or 10% depending on baseline in DY2

- DY5:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[450] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.19 Antidepressant Medication Management *(Standalone measure)*
Unique RHP Outcome Identification Number: 121790303.3.21

Performing Provider Name/TPI: Baylor Medical Center at Garland/121790303

Outcome Description:
IT-1.19: Antidepressant Medication Management - NQF 0105237 *(Standalone measure)*

Numerator:

A) Effective Acute Phase Treatment: At least 84 days (12 weeks) of continuous treatment with antidepressant medication during the 114-day period following the IPSD (inclusive). The continuous treatment allows gaps in medication treatment up to a total of 30 days during the 114-day period. Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, there may be no more than 30 gap days. Count any combination of gaps (e.g., two washout gaps of 15 days each, or two washout gaps of 10 days each and one treatment gap of 10 days).

B) Effective Continuation Phase Treatment: At least 180 days (6 months) of continuous treatment with antidepressant medication (Table AMM-D) during the 231-day period following the IPSD (inclusive). Continuous treatment allows gaps in medication treatment up to a total of 51 days during the 231-day period.Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, gap days may total no more than 51. Count any combination of gaps (e.g., two washout gaps, each 25 days or two washout gaps of 10 days each and one treatment gap of 10 days).

Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year.
***Note** because this project will occur in an ambulatory setting, we will need to modify the denominator to more accurately measure the impact of this outcome. Instead of members discharged from an acute inpatient setting with a mental health diagnosis (as many of these patients may not come to a Baylor Clinic), we propose changing the denominator to all patients at a Baylor Clinic on the Baylor Medical Center at Garland campus with an identified mental health issue and on a psychiatric medication.

We do not have an established baseline of tracking patients who received Acute Phase/Continuation phase treatment with antidepressants. Based on the baseline analysis in DY2, we may have to reevaluate or modify this outcome.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish baseline rates
    - We will establish our baseline rate. Based on clinician input, we believe about 20% of patients in Baylor Clinics are on an antidepressant. We do not have any data on how many of those patients received acute/continuous phase treatment.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 5%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 3%
- DY4:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 10%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 5%
- DY5:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 15%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 7%

Rationale

Approximately 20% of Baylor Clinic patients on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the region. The top 10 utilizers in the region had BH related issues.[451] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug

[451] RHP 9 Community Health Needs Assessment

adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[452]" Our project supports this methodology.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS, 2012, NQF 0018) (Standalone)

Unique RHP Outcome Identification Number: 121776204.3.1

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-1.7: Controlling high blood pressure *(Standalone measure)*

- Numerator: The number of patients in the denominator whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year
- Denominator: Patients 18 to 85 years of age as of December 31 of the measurement year with a diagnosis of hypertension

As one of our primary care metrics we chose blood pressure. As high blood pressure is a prerequisite to many other chronic illnesses and serious medical conditions, getting BP under control with proper PCP supervision, medications and regular visits can help patients' quality of life and overall health.

By the end of the waiver, our goal is to have > 75.5% (or a total of 7.5% improvement over baseline) of patients who are patients of the Baylor Clinics at Baylor Medical Center at Irving to have good blood pressure control (< 140/80 mmHg). This is an improvement of 7.5% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. Baylor currently tracks BP control and uses a threshold of <130/80 mmHg for patients that have hypertension. Based on our current data, 71.4% of patients with hypertension have controlled BP (130/80 mmHg

Improvement Milestones

- DY3:
    - [IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
        - Our goal is increase the % of patients that have BP control (140/80 mmHg) to 72.8% (or 1.4% improvement over established baseline)
- DY4:
    - IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
        - Our goal is increase the % of patients that have BP control (140/80 mmHg) to 74.2% (or 2.8% improvement over baseline)
- DY5:
    - [IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
        - Our goal is increase the % of patients that have BP control (140/80 mmHg) to 75.5% (or 4.1% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED visits.[453] A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population, who make up 22.5% of the RHP 9 population[454] and 12.3% of the Irving population.[455] Blood pressure is a standard metric that all Baylor Clinics monitor and regulate. Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education about their illness in this clinic PCMH setting. Our metrics and milestones are designed to increase improvement in BP control for the target population.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (Standalone measure)

1) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Clinic Wait Times

Unique RHP Outcome Identification Number: 121776204.3.2

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; ***(Standalone measure)***
(2) how well their doctors communicate; ***(Standalone measure)***
(3) patient's rating of doctor access to specialist; ***(Standalone measure)***
(4) patient's involvement in shared decision making, and ***(Standalone measure)***
(5) patient's overall health status/functional status. ***(Standalone measure)***

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring is to improve the satisfaction scores in regards to clinic wait times.

By the end of the waiver, our goal is to have the patients at Baylor Clinics on the Baylor Medical Center at Irving campus to attain a patient satisfaction score of 84.8% (or total 2.5% improvement over baseline) on the survey question related to wait time to appointment satisfaction. This falls under metric (1)- patients are getting timely care, appointments and information of 3.6.1, option (1). Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Although the Baylor Clinic at Baylor Medical Center at Irving is at a 82nd percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 82.3% is equivalent to only a 43 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Process Milestones:

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. Currently, the Baylor Clinics at Baylor Medical Center at Irving are at 82.3% satisfaction with clinic wait times

Improvement Milestones:

- DY3:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to wait times to 83.2% (or 0.9% improvement over baseline)
- DY4:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to wait times to 84.0% (or 1.7% improvement over baseline)
- DY5:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - our goal is increase the % of patient satisfaction related to wait times to 84.8% (or 2.5% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[456]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to

[456] Drain, M., & Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

1) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around improving clinic wait times for patients

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

2) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls

Unique RHP Outcome Identification Number: 121776204.3.3

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; ***(Standalone measure)***
(2) how well their doctors communicate; ***(Standalone measure)***
(3) patient's rating of doctor access to specialist; ***(Standalone measure)***
(4) patient's involvement in shared decision making, and ***(Standalone measure)***
(5) patient's overall health status/functional status. ***(Standalone measure)***

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring improvement in the responsiveness to patient phone calls in a timely manner.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor Medical Center at Irving obtain a patient satisfaction score of 89.7% (or a total of 1.7% improvement over baseline) on the survey question related to patient phone calls being returned in a timely fashion. This falls under metric (2) Patients are getting timely care, appointments and information of 3.6.1, option (2). Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Although the Baylor Clinic at Baylor Medical Center at Irving is at a 88th percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 88.0% is equivalent to a 69 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. Currently, the Baylor Clinics at Baylor Medical Center at Irving are at 88.0% satisfaction with patients receiving a response to their phone calls in a timely manner

Improvement Milestones

- DY3:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 88.6% (or minimum of 0.6% improvement over baseline)
- DY4:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 89.2% (or minimum of 1.2% improvement over baseline)
- DY5:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 89.7% (or a minimum of 1.7% improvement over baseline)

Although the Baylor Clinic at Baylor Medical Center at Irving is at a 88th %ile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[457]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

2) *Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around response times to patient phone calls*

Outcome Measure Valuation:

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.1 Breast Cancer Screening (Non-Standalone)

Unique RHP Outcome Identification Number: 121776204.3.4

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-12.1: Breast Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.
- Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded

By the end of the waiver, our goal is to have > 50.7% (or total of 8.2% improvement over baseline) of women ages 40-69 who are patients of the Baylor Clinics at Baylor Medical Center at Irving to have a breast cancer screening. This is an improvement of 8.2% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones:

DY2:

P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

We will confirm and establish our baseline. The Baylor Clinic at Baylor Medical Center at Irving is at a 42.5% screening rate for women between 40-69 years old

Improvement Milestones

DY3:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 45.4% (or 2.9% improvement over baseline)

DY4:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 48.1% (or 5.6% improvement over baseline)

DY5:

[IT-12.1]: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

Our goal is increase the % of patients have had a breast cancer screen to at least 50.7% (or 8.2% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, 23.7/100,000 women die from breast cancer, with a higher rate of 37/100,000 for African American women.[458] According to the Healthy North Texas community dashboard, 76.1% of women in the Dallas-Plano-Irving areas received a mammogram, leaving opportunities to increase this rate for the underserved population. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.

Title of Outcome Measure (Improvement Target): IT-12.5 Other USPSTF-endorsed screening outcome measures (Non-Standalone): Influenza Vaccination Rate

Unique RHP Outcome Identification Number: 121776204.3.5

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-12.5: Other USPSTF-endorsed screening outcome measures

As part of primary care, the influenza vaccine is a simple, cost effective way for patients to protect themselves from the flue and other potential clinical exacerbations.

By the end of the waiver, our goal is to have > 66.0% (or 5.7% improvement over baseline) of patients of Baylor Clinic patients over the age of 18 receive an influenza vaccination. This is an improvement of 5.7% over baseline. . Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. The Baylor Clinics at Baylor Medical Center at Irving are at a 60.3% rate for patients over the age of 18 that have received an influenza vaccine in the past 12 months

Improvement Milestones

- DY3:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 62.3% (or 2% improvement over baseline)
- DY4:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 64.2% (or 3.9% improvement over baseline)

- DY5:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)

        - Our goal is increase the % of >18 years old that have had an influenza vaccination in the past 12 months to 66.0% (or 5.7% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months.[459] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in identified disparity group. Improvement in Asthma Metrics

Unique RHP Outcome Identification Number: 121776204.3.6

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

The disparity group for this metric is the underserved/uninsured population in Dallas County that has uncontrolled Asthma.

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of asthma opportunities completed/fulfilled
- Denominator: Asthma appropriate opportunities x number of asthma patients

By the end of the waiver, our goal is to have achieved a 30.4% (or 11.6% improvement over baseline) percent of opportunities achieved for the Baylor Health Care System Asthma Percent of Opportunity Achieved (POA). This is an aggressive 11.6% improvement target over baseline.

At Baylor Health Care System, we have a standard Asthma POA which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate POA by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population.

POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period.

For an illustrative example: For Asthma- there are 4 potential opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To

achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.
Our milestones include the following:

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 18.8% POA was achieved for Asthma patients

Outcome Improvement Targets for each year

- DY3:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 22.9% (or 4.1% improvement over baseline)
- DY4:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 26.7% (or 7.9% improvement over baseline)
- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 30.4% (or 11.6% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Pulmonologists should handle more complex cases but also use this opportunity to help educate the underserved population (especially Hispanics and African Americans) about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

We plan on measuring the improvement in Asthma for Baylor Clinic patients that receive care from a specialist. At Baylor Health Care System, we have a standard Asthma Percent of

Opportunities Achieved which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We feel that this measure is a comprehensive way to measure the patients with Asthma in the Baylor Clinic and manage their condition holistically.

Asthma affects about 19.6% of the Dallas County population and had approximately 1158 cases of hospitalization in 2010[460]. According to the Office of Minority Health, African Americans were 30% more likely to have Asthma than non-Hispanic whites and were three times more likely to die from an Asthma related issue than non-Hispanic whites. African Americans make up 12.3% of the Irving population.[461] Hispanics are 30% more likely to visit the hospital for Asthma than non-Hispanic whites.[462] Hispanics comprise 41.1% of the Irving population.[463]

A study by Meng, Leung, et. al found that patients with Asthma that saw a specialist had higher rates of compliance because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients leading to better quality outcomes and long(er) term control[464]. Making the pulmonologist a part of our Asthma patients' care team will help to avoid exacerbations, prevent complications and reduce hospitalizations.
Many of the underserved patients in the region require specialty care related to chronic diseases. Lack of timely access to this needed care, often results in clinical exacerbations and worsening of their health conditions that can be avoided or lessened through improved access. A study conducted in 2010 by Bellinger, et. al confirmed that minority and underserved populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.[465]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or

Title of Outcome Measure (Improvement Target): IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 121776204.3.7

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-12.2: Cervical Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.
- Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

As part of preventive care and screenings, cervical cancer screening is a standard practice that PCP/PCMHs provide for their patients. Education and regular exams can be the difference between early detection and death. By the end of the waiver, our goal is to have > 73.3% (or 4.4% improvement over baseline) of patients who are Baylor Clinic at Baylor University Medical Center be screened for Cervical Cancer. This is a 4.4% improvement over baseline. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 72.2% of patients at the Baylor Clinic at Baylor Medical Center at Irving have had a Cervical Cancer screening

Outcome Improvement Targets for each year

- DY3:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 73.6% (or 1.4% improvement over baseline)
- DY4:
    - IT-12.2: Cervical Cancer Screening

        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 74.9% (or 2.7% improvement over baseline)
- DY5:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 76.2% (or 4% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that OB/GYNs should handle more complex cases but also use this opportunity to help educate underserved women in Irving about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period

In Dallas County approximately the incidence rate of cervical cancer is 9.7 per 100,000.[466] According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women.[467] In Irving, the African American population comprises 12.3% of the population, and Hispanics comprise 41.1%.[468] There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a PCP/PCMH setting.

Outcome Measure Valuation

Title of Outcome Measure (Improvement Target): IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 121776204.3.8

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description

IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)

- Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
- Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

By the end of the waiver, our goal is to have > 48.3% (or a total of 8.6% improvement over baseline) of patients who are Baylor Clinic patients at Baylor Medical Center at Irving be screened for Colorectal Cancer. This is an improvement of 8.6% over baseline.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that only 39.7% of patients at the Baylor Clinic at Baylor Medical Center at Irving have had a Colorectal Cancer Screening

Outcome Improvement Targets for each year

- DY3:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 42.7% (or 3% improvement over baseline)
- DY4:
  - IT-12.3 Colorectal Cancer Screening

        - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 45.6% (or 5.9% improvement over baseline)

- DY5:
    - IT-12.3 Colorectal Cancer Screening
        - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 48.3% (or 8.6% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Gastroenterologists should handle more complex cases but also use this opportunity to help educate underserved adults about the importance of screenings and prevention. The Baylor Clinic is currently only at a 39% completion rate and will need the help of their specialist partners to meet these goals.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period

In Dallas County less than 60% of individuals 50 and over have had a sigmoidoscopy or colonoscopy examination. The colorectal cancer incidence rate is 43.3 cases per 100,000 people. 60% of deaths due to colorectal cancer can be avoided.[469] There is a definite need for these services in Dallas County and the Baylor Clinic plans to provide these screenings to a greater number of people. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.[470] In Irving, African Americans comprise 12.3% of the population and Hispanics, 41.1%.[471] There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for

Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes Care: HbA1c poor control (> 9.0%)- NQF 0059 (Standalone measure)

Unique RHP Outcome Identification Number: 121776204.3.9

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-1.10 Diabetes care: *HbA1c poor control (>9.0%) (Standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have < 8.8% (or a minimum reduction of 1.5% over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. The additional qualifiers for this metric are the following: 1) a patient has been engaged in chronic care management for at least 6 months, 2) Two HbA1c measures will be taken per patient and the most recent HbA1c score will be used for reporting.

One of the outcome measures we have chosen for our chronic care management program is HbA1c performance, as determined by a reduction in poor control, defined as the percent of the population with HbA1c > 9.0%. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish Baseline Rates
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 10.3% of patients at the Baylor Clinic at Baylor Medical Center at Irving have an HbA1c > 9.0%

Outcome Improvement Targets for each year

- DY3:
  - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
    - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 9.8% (or 0.5% reduction over baseline)
- DY4:
  - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
    - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 9.3% (or 1% reduction over baseline)
- DY5:
  - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
    - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 8.8% (or 1.5% reduction over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes.[472] Traditionally, the underserved population in Irving does not have access to the necessary medications and supplies to manage their diabetes thus many patients go undiagnosed or have poor glucose control. Lack of proper education coupled with a lack of primary care attention often leads to more severe complications and poor health outcomes for those with diabetes. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions.

Bodenheimer, et. al, found that patient self management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients.[473] A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs[474]. Focusing efforts on improving glycemic control should result in reduced co-morbid conditions and improved complication rates for these

[472] RHP 9 Community Health Needs Assessment

patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.11 Diabetes Care: BP control (<140/80 mmHg) NQF 0061 (Standalone measure)

Unique RHP Outcome Identification Number: 121776204.3.10

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-1.11 Diabetes care: *BP control (<140/80mm Hg)- (Standalone measure)*

- Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have > 64.8% (or 5.9% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) under BP control (< 140/80 mmHg). This is a 5.9% improvement over baseline. This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program for at least 6 months.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish Baseline Rates
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 58.9% of patients with diabetes at the Baylor Clinic at Baylor Medical Center at Irving have BP less than 130/80 mmHg. At Baylor Medical Center at Irving Medical Center, we have been historically defining uncontrolled BP > 130/80 mmHg, we will have to adjust our tracking for this project.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.11: Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 61.0% (or 2.1% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program
- DY4:

- IT-1.11: Diabetes Care: BP control (<140/80 mmHg)
    - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 62.9% (or 4% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

- DY5:
    - IT-1.11: Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is have at least 64.8% (or 5.9% improvement over baseline) of patients in good BP control (<140/80 mmHg)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

We will have to review our baseline numbers in DY2. Historically, in our E.H.R we have been tracking BP control as < 130/80 mmHg. In order to meet the requirements of this project, we will have to re-analyze the numbers and re-establish our new baseline.

As part of the standard of care for diabetes management, optimal blood pressure control is an included component of this protocol. At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[475]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic-based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to

[475] Cushman WC, Evans, GW, et. al Effects of intensive blood pressure control in type 2 diabetes mellitus. N Engl J Med. 2010. Apr 29; 362(17): 1575-85

determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.13 Diabetes Care: Diabetes care: Foot exam- NQF 0056

Unique RHP Outcome Identification Number: 121776204.3.11

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-1.13 Diabetes care *Foot exam- (Non- standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

By the end of the waiver, our goal is to have > 80.6% (or 7.2% improvement over baseline) patients 18-75 years old with diabetes (type 1 or type 2) receive a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year(s). This is an improvement of 7.2% over baseline. These improvements are for patients who are Baylor Clinic patients and have engaged in the chronic care management program.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows 73.4% of diabetic patients that are seen by a diabetes educator at the Baylor Clinic at Baylor Medical Center at Irving receive a foot exam
    -

Outcome Improvement Targets for each year

- DY3:
  - IT-1.13: Diabetes Care: Foot exam
    - Our goal is to increase this rate to at least 76.1% of diabetic patients receiving a foot exam (or 2.7% improvement over baseline)
- DY4:
  - IT-1.13: Diabetes Care: Foot exam
    - Our goal is to increase this rate to at least 78.5% of diabetic patients receiving a foot exam (or 5.1% improvement over baseline)

- DY5:
    - IT-1.13: Diabetes Care: Foot exam
        - Our goal is to increase this rate to at least 80.6% of diabetic patients receiving a foot exam (or 7.2% improvement over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues. This is better utilization and management of resources through early identification and prevention of serious diabetes foot related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation[476].

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in Identified Disparity Group. Clinical indicator to be improved and disparity group to be determined by provider.

Unique RHP Outcome Identification Number: 121776204.3.12

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
- Denominator: Total number of patients with a Behavioral Health intervention/
- encounter

One of the outcome measures we have chosen for our behavioral health program is to improve Baylor's standard diabetes Percent of Opportunities Achieved (POA) which consists of HbA1c, LDL, BP control for patients who have engaged in our behavioral health program. POA is similar in nature to an improvement bundle, but differs slightly in the way it is calculated. Here, we define the disparate population as the underserved individuals in Dallas County (Irving) that have both a diagnosis of diabetes and a behavioral health issue.

By the end of the waiver, our goal is to have > 15% of patients who have had a behavioral health intervention/encounter to have improvement in our Diabetes POA (HbA1c, LDL, BP, etc) that have uncontrolled values for these measures and have an identified behavioral health issue.

- HbA1c < 8%
- LDL < 100
- BP < 130/80 mmHg

Baylor's standard diabetes POA is measured by using percent of opportunities achieved (POA). We plan on measuring the improvement in Diabetes for Baylor Clinic patients that receive behavioral health treatment. The Diabetes POA which consists of: LDL, BP and HbA1c control is measured yearly for our diabetic patients. The POA is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60%

within a population means the clinic was successful in achieving 10% more processes/targets for their diabetes patients than in the prior reporting period.

For an illustrative example: For Diabetes- there are 3 opportunities (i.e. metrics) per patient (1) A1c < 8, 2) LDL < 100, 3) BP < 130/80 mmHg). The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 77% achievement.

We define this outcome in the following way:

Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter

Denominator: Total number of patients with a Behavioral Health intervention/ encounter

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will establish a baseline of current status of the Diabetes POA for patients that have a reported behavioral health issue
- DY3:
  - P-2: Establish Baseline Rates
    - We will compare the DY2 baseline rate to results in DY3 to measure change refine data collection processes if necessary

Outcome Improvement Targets for each year

- DY3:
  - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
    - We will improve the Diabetes POA for 5% of patients who have had at least one behavioral health intervention/encounter in one year
- DY4:
  - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
    - We will improve the Diabetes POA for 10% of patients who have had at least one behavioral health intervention/encounter in one year
- DY5:

- IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients
  - We will improve the Diabetes POA for 15% of patients who have had at least one behavioral health intervention/encounter in one year

Rationale

Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to recognize and increase awareness of patients who have co-occurring behavioral health and diabetes health issues. By recognizing this, we believe we can positively impact diabetes outcomes by addressing underlying behavioral health issues that patients may have.

In DY2, we will collect our baseline information about the status of the Diabetes Metrics (HbA1c, LDL, BP) for patients who have a documented behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.

In Region 9, there is a 36% increase in average charges per encounter for those individuals with a co-occurring behavioral health issue and chronic disease. 100% of the frequent flyers had a co-occurring mental illness and cost the Region over $26 million dollars.[477]

A recent study conducted in early 2012, by Jeffery Johnson, et. al showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression. Depression is associated with poorer self care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health

[477] RHP 9 Community Health Needs Assessment

issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases[478].

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. (**Non-standalone measure**)

Unique RHP Outcome Identification Number: 121776204.3.13

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. *(Non-standalone measure)*

- Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
- Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

One of the outcome measures we have chosen for our behavioral health program is to increase the number of patients in the underserved population who have improved utilization rates for receiving behavioral health treatments/interventions. The subset of the target population that suffers from mental health issues is prevalent in the region. Only 19.8% of underserved patients receive behavioral treatment in the same setting as their primary care[479]. The disparate population that we will be focusing on is the underserved/uninsured patients in Dallas County (Irving) with behavioral health needs.

By the end of the waiver, our goal is to have > 20% of patients who are eligible to participate in the behavioral health program, engage in the program.

We define this outcome in the following way:

- Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
- Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure is different than the Improvement Milestone we proposed in our Category 2 Project Table because Outcome Measure 11.3 focuses on utilization of the

[479] RHP 9 Community Health Needs Assessment

behavioral health service, entailing that an "engaged" patient is one that has had at least two behavioral health encounters/interventions in the past 12 months. The Improvement Milestone in the project table is a volume metric focused on enrolling the patient in a Behavioral Health program. This Outcome Measure takes this one step further by requiring at least two visits in the past 12 months.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will establish a baseline of how many patients have a behavioral health issue (substance abuse, anxiety, depression, other) based on our E.H.R, self-reported or clinician reported status.
- DY3:
  - P-2: Establish Baseline Rates
    - We will compare our DY2 baseline analysis to DY3 to determine if any improvements need to be made to the data collection process and to capture any variances between the two data sets

Outcome Improvement Targets for each year

- DY3:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 10%
- DY4:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 15%
- DY5:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 20%

Rationale

Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to demonstrate increased access and utilization of the behavioral health program we are proposing.

In DY2, we will collect our baseline information about the number of patients who have a behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-5.1 Improved Cost Savings: Demonstrate cost savings in care delivery (Non-**Standalone measure**)

Unique RHP Outcome Identification Number: 121776204.3.14

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (*Standalone measure for Project 2.5 only. For all other projects –Non- standalone measure)*

- Type of analysis to be determine by provider from the following list: Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis

By the end of the waiver, our goal is to have > 30% cost savings in health care services utilization (through fewer ED visits and less overall utilization) for patients who have engaged in our care navigation program and have a confirmed appointment with a PCP/PCMH.

One of the outcome measures we have chosen for our care navigation program is to improve cost savings in the healthcare delivery system for those patients that have been served by the care navigation program.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - In DY2 we will establish a baseline of average cost savings incurred by patients who have been seen by the care navigation program while in the ED and have a confirmed appointment with a PCP/PCMH. We will compare pre and post utilization patterns of enrolled patients to determine the total cost savings incurred (inpatient and outpatient) per patient. For example, if prior to being seen by our care navigation program, a patient's total cost utilization was $10,000 we anticipate that after being connected to the appropriate resource and being seen for an appointment that over the course of 1 year, total costs would decrease by 20% (DY4) to $8,000.

Outcome Improvement Targets for each year

- DY3:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 15% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- DY4:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 20% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- DY5:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 25% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year

Rationale

In DY2, we plan to do some in depth utilization analysis to determine a baseline of what the cost utilization patterns are for patients seen at Baylor Medical Center at Irving. This, based on our historical experience with similar programs on other campuses, we anticipate a 15%, 20% and 25% cost savings over the subsequent years in total cost of care savings.

The reason we chose this metric is because financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[480]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region.

Outcome Measure Valuation

[480] Texas Medical Association: http://www.texmed.org

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization

Unique RHP Outcome Identification Number: 121776204.3.15

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Measure Description

IT-9.2 ED appropriate utilization *(Standalone measure)*

- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-N/A
- Reduce Emergency Department visits for target conditions
    - Congestive Heart Failure
    - Diabetes
    - End Stage Renal Disease
    - Cardiovascular Disease/Hypertension
    - Behavioral Health/Substance Abuse
    - Chronic Obstructive Pulmonary Disease
    - Asthma

By the end of the waiver, our goal is to have > 35% reduction in inappropriate ED utilization for all causes and > 20% reduction in inappropriate ED utilization for targeted conditions: CHF, Diabetes, ESRD, CVD/Hypertension, Behavioral Health/Substance Abuse, COPD and Asthma

One of the outcome measures we have chosen for our care navigation program is to reduce ED utilization. The protocol mentions three parts to this metric:

4) Reduce all ED visits (including ACSC)
5) Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-*we will not be measuring this outcome as we do not see pediatric patients at Baylor University Medical Center*
6) Reduce ED visits for target conditions
    a. CHF
    b. Diabetes
    c. ESRD
    d. CVD/Hypertension
    e. Behavioral Health/Substance Abuse
    f. COPD
    g. Asthma

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-3: Establish Baseline Rates
        - We will establish a baseline for the aforementioned components of the improvement metric (less #2- pediatric ED visits) and determine the full opportunity for improvement
- DY3:
    - P-3 Establish Baseline Rates
        - We will conduct a comparison between DY2 and DY3 to determine the change in rates for ED utilization and utilization of targeted conditions and determine any seasonality or variations in data collection/trends

Outcome Improvement Targets for each year

- DY3:
    - IT-9.2: ED Appropriate Utilization
        - We aim to reduce all ED visits by 25% and ED visits for targeted conditions by 10%
- DY4:
    - IT-9.2: ED Appropriate Utilization
        - We aim to reduce all ED visits by 30% and ED visits for targeted conditions by 15%
- DY5:
    - IT-9.2: ED Appropriate Utilization
        - We aim to reduce all ED visits by 35% and ED visits for targeted conditions by 20%

Rationale

Baylor Medical Center at Irving sees very few children, thus metric 2 is not applicable to this project. We do not see enough pediatric patients to make a material impact on the ED utilization rate for this population. Historically, we have not tracked the ED utilization for targeted conditions (i.e. CHF, Diabetes, etc), for this type of project thus we do not have a baseline measurement for these specific diseases. We plan to measure these in DY2 and DY3 and target a modest improvement of ED utilization in the subsequent years.

According to the Community Health Needs Assessment of Region 9, 68% of ED visits were preventable/treatable in an outpatient setting[481]. The stakeholder survey conducted amongst performing providers also indicated that there is a significant overuse of emergency department services due to patients' inability to access primary care. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues[482]. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP Outcome Identification Number: 121776204.3.16

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-10.1: Quality of Life *(Standalone measure)*
Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Quality of Life tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. We do not currently utilize Quality of Life surveys. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that that Quality of Life indicators such as depression and cognition exams improve over time with home visits.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.
- DY4:
    - IT-1.10: Quality of Life (Standalone)

        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.
- DY5:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[483] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure Valuation

Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living
Unique RHP Outcome Identification Number: 121776204.3.17
Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-10.2: Activities of Daily Living *(Standalone measure)*
Demonstrate improvement in ADL scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Activities of Daily Living tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that ADL improvement in the elderly population improves where patients go from partial dependence to independence.

Outcome Improvement Targets for each year

- DY3:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.
- DY4:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient

Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.

- DY5:
  - IT-10.2: Activities of Daily Living *(Standalone measure)*
    - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[484] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or barriers that patients may be experiencing.[485] We may need to consider using the Lawton IADL scale for this population as it involves more complex activities such as: shopping, laundry, responsibility for own medications, etc.[486] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.2 Annual monitoring for patients on persistent medication– angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)

Unique RHP Outcome Identification Number: 121776204.3.18

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-1.2: Annual monitoring for patients on persistent medications angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)
Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.
Percentage of members 18 years of age and older who received at least 180 treatment days of ACE inhibitors or ARBs during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on an ACE/ARB

inhibitor. We do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to anti-hypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[487] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or

Title of Outcome Measure (Improvement Target): IT-1.4 Annual monitoring for patients on persistent medications diuretic *(Non- standalone measure)*
Unique RHP Outcome Identification Number: 121776204.3.19

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-1.4: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) diuretic *(Non- standalone measure)*
Percentage of members 18 years of age and older who received at least 180 treatment days of a diuretic during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on a diuretic. We do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
    - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
    - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[488]

Title of Outcome Measure (Improvement Target): IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant *(Non- standalone measure)*
Unique RHP Outcome Identification Number: 121776204.3.20

Performing Provider Name/TPI: Baylor Medical Center at Irving/121776204

Outcome Description:
IT-1.5: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) anticonvulsant *(Non- standalone measure)*
Percentage of members 18 years of age and older who received at least 180 treatment days for an anticonvulsant during the measurement year and had at least one drug serum concentration level monitoring test for the prescribed drug in the measurement year.

Since we do not have a baseline for patients receiving a serum concentration test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% of patients on an anticonvulsant are receiving a serum concentration test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 5% of patients in Baylor Clinics are on an anticonvulsant. We do not have any data on how many of those patients received a serum test in the past year.

Outcome Improvement Targets for each year

- DY3:

    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
    - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
        - Our goal is increase the % of patients that have had a serum concentration test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[489] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Numerator:

A) Effective Acute Phase Treatment: At least 84 days (12 weeks) of continuous treatment with antidepressant medication during the 114-day period following the IPSD (inclusive). The continuous treatment allows gaps in medication treatment up to a total of 30 days during the 114-day period. Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, there may be no more than 30 gap days. Count any combination of gaps (e.g., two washout gaps of 15 days each, or two washout gaps of 10 days each and one treatment gap of 10 days).

B) Effective Continuation Phase Treatment: At least 180 days (6 months) of continuous treatment with antidepressant medication (Table AMM-D) during the 231-day period following the IPSD (inclusive). Continuous treatment allows gaps in medication treatment up to a total of 51 days during the 231-day period.Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, gap days may total no more than 51. Count any combination of gaps (e.g., two washout gaps, each 25 days or two washout gaps of 10 days each and one treatment gap of 10 days).

Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year.
***Note** because this project will occur in an ambulatory setting, we will need to modify the denominator to more accurately measure the impact of this outcome. Instead of members discharged from an acute inpatient setting with a mental health diagnosis (as many of these patients may not come to a Baylor Clinic), we propose changing the denominator to all patients at a Baylor Clinic on the Baylor Medical Center at Irving campus with an identified mental health issue and on a psychiatric medication.

We do not have an established baseline of tracking patients who received Acute Phase/Continuation phase treatment with antidepressants. Based on the baseline analysis in DY2, we may have to reevaluate or modify this outcome.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish baseline rates
    - We will establish our baseline rate. Based on clinician input, we believe about 20% of patients in Baylor Clinics are on an antidepressant. We do not have any data on how many of those patients received acute/continuous phase treatment.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 5%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 3%
- DY4:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 10%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 5%
- DY5:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 15%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 7%

Rationale

Approximately 20% of Baylor Clinic patients on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the region. The top 10 utilizers in the region had BH related issues.[490] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug

[490] RHP 9 Community Health Needs Assessment

adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[491]" Our project supports this methodology.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.7 Controlling High Blood Pressure (NCQA-HEDIS, 2012, NQF 0018) **(Standalone)**

Unique RHP Outcome Identification Number: 139485012.3.1

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-1.7: Controlling high blood pressure *(Standalone measure)*

- Numerator: The number of patients in the denominator whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year
- Denominator: Patients 18 to 85 years of age as of December 31 of the measurement year with a diagnosis of hypertension

As one of our primary care metrics we chose blood pressure. As high blood pressure is a prerequisite to many other chronic illnesses and serious medical conditions, getting BP under control with proper PCP supervision, medications and regular visits can help patients' quality of life and overall health.

By the end of the waiver, our goal is to have > 59.0% (or 6.8% total improvement over established baseline) of patients who are Baylor Clinic at Baylor University Medical Center have good blood pressure control (< 140/80 mmHg). This is a projected 6.8% improvement over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic.

Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. Baylor currently tracks BP control and uses a threshold of < 130/80 mmHg for patients that have hypertension. Based on our current data, 52.2% of patients with hypertension have controlled BP (130/80 mmHg)

Outcome Improvement Targets for each year

- DY3:
  - [IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (< 140/80 mmHg) to 54.6% (or 2.4% improvement over baseline established in DY2)
- DY4:
  - [IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (< 140/80 mmHg) to 56.9% (or 4.7% improvement over baseline established in DY2)
- DY5:
  - [IT-1.7]: Controlling High Blood Pressure (NCQA-HEDIS 2012, NQF 0018) (Standalone)
    - Our goal is increase the % of patients that have BP control (< 140/80 mmHg) to 59.0% or 6.8% improvement over baseline established in DY2)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 9, Hypertension was identified as one of the top 5 most prevalent diseases in the area for ED visits.[492] A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African American population, who make up 22.5% of the RHP 9 population[493]. Blood pressure is a standard metric that all Baylor Clinics monitor and regulate. Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle

[492] RHP 9 Community Health Needs Assessment
[493] http://health.nytimes.com/health/guides/disease/hypertension/complications.html

management techniques and education about their illness in this clinic PCMH setting. Our metrics and milestones are designed to increase improvement in BP control for the target population.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

1) Patients are getting timely care, appointments and information (Standalone measure) : Measurement of Satisfaction Related to Clinic Wait Times

Unique RHP Outcome Identification Number: 139485012.3.2

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; ***(Standalone measure)***
(2) how well their doctors communicate; ***(Standalone measure)***
(3) patient's rating of doctor access to specialist; ***(Standalone measure)***
(4) patient's involvement in shared decision making, and ***(Standalone measure)***
(5) patient's overall health status/functional status. ***(Standalone measure)***

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring is to improve the satisfaction scores in regards to clinic wait times. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor University Medical Center obtain a patient satisfaction score of 86.1% (or at least a total of 2.3% improvement over established baseline) on the survey question related to wait time to appointment satisfaction. This falls under metric (1)- patients are getting timely care, appointments and information of 3.6.1, option (1). Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Although the Baylor Clinic at Baylor University Medical Center is at a 83rd percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 83.8% is equivalent to a 52 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. Currently, the Baylor Clinic at Baylor University Medical Center is at 83.8% satisfaction with clinic wait times

Outcome Improvement Targets for each year

- DY3:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to wait times to 84.6% (or 0.8% improvement over DY2 baseline)
- DY4:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to wait times to 85.4% (or 1.6% improvement over DY2 baseline)
- DY5:
    - IT-6.1: Percent improvement of patient satisfaction scores
        - Our goal is increase the % of patient satisfaction related to wait times to 86.1% (or 2.3% improvement over DY2 baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[494]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to

[494] Drain, M., & Kaldenberg, D. O. (1999). Building patient loyalty and trust: The role of patient satisfaction. *Group Practice Journal*, 48(9),32-35.

patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

1) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around improving clinic wait times for patients

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (**Standalone measure)**

2) Patients are getting timely care, appointments and information (Standalone measure): Measurement of Satisfaction Related to Response Time to Patient Phone Calls

Unique RHP Outcome Identification Number: 139485012.3.3

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; ***(Standalone measure)***
(2) how well their doctors communicate; ***(Standalone measure)***
(3) patient's rating of doctor access to specialist; ***(Standalone measure)***
(4) patient's involvement in shared decision making, and ***(Standalone measure)***
(5) patient's overall health status/functional status. ***(Standalone measure)***

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients' in their own care. For this metric we will be measuring improvement in the responsiveness to patient phone calls in a timely manner.

By the end of the waiver, our goal is to have the Baylor Clinic at Baylor University Medical Center obtain a patient satisfaction score of 87.3% (or a minimum of 2.1% total improvement over established baseline) on the survey question related to patient phone calls being returned in a timely fashion. This falls under metric (2) Patients are getting timely care, appointments and information of 3.6.1, option (2). Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic

Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- We will confirm and establish our baseline. Currently, the Baylor Clinic at Baylor University Medical Center is at 85.2% satisfaction with patients receiving a response to their phone calls in a timely manner

Outcome Improvement Targets for each year

- DY3:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 85.9% (or 0.7% improvement over DY2 baseline)
- DY4:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 86.6% (or 1.4% improvement over DY2 baseline)
- DY5:
  - IT-6.1: Percent improvement of patient satisfaction scores
    - Our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 87.3% (or 2.1% improvement over DY2 baseline)

Although the Baylor Clinic at Baylor University Medical Center is at a 85th percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 85.2% is equivalent to a 62 percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients' ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider.

Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease[495]. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however there is opportunity for improvement. This outcome has an impact on the region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

2) Patients are getting timely care, appointments and information (Standalone measure): We will measure this particular metric through monitoring and improving the survey question around response times to patient phone calls

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.1 Breast Cancer Screening (Non-Standalone)

Unique RHP Outcome Identification Number: 139485012.3.4

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-12.1: Breast Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.
- Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded

By the end of the waiver, our goal is to have > 64.6% (or a minimum of 5.9% total improvement over established baseline) of women ages 40-69 who are patients of the Baylor Clinic at Baylor University Medical Center to have a breast cancer screening. This is a 5.9% improvement over the waiver period. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic.

Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. The Baylor Clinic at Baylor University Medical Center is at a 58.7% screening rate for women between 40-69

Outcome Improvement Targets for each year

- DY3:
    - IT-12.1: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)
        - Our goal is increase the % of patients have had a breast cancer screen to at least 60.8% (or 2.1% improvement over DY2 baseline)
- DY4:
    - IT-12.1: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)

        - Our goal is increase the % of patients have had a breast cancer screen to at least 62.7% (or 4.0% improvement over DY2 baseline)
        -
- DY5:
    - IT-12.1: Breast Cancer Screening (HEDIS 2012) (Non-Standalone)
        - Our goal is increase the % of patients have had a breast cancer screen to at least 64.6% (or 5.9% improvement over DY2)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, 23.7/100,000 women die from breast cancer, with a higher rate of 37/100,000 for African American women.[496] There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.5 Other USPSTF-endorsed screening outcome measures (Non-Standalone): Influenza Vaccination Rate

Unique RHP Outcome Identification Number: 139485012.3.5

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description

IT-12.5: Other USPSTF-endorsed screening outcome measures

As part of primary care, the influenza vaccine is a simple, cost effective way for patients to protect themselves from the flue and other potential clinical exacerbations.

By the end of the waiver, our goal is to have > 59.3% (or a minimum of 6.8% total improvement over established baseline) of Baylor Clinic patients over the age of 18 receive an influenza vaccination. This is an improvement of 6.8% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.Improvement will be measured primarily on new patients to the Baylor Clinic

Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. The Baylor Clinic at Baylor University Medical Center is at a 52.5% rate for patients over the age of 18 that have received an influenza vaccine in the past 12 months

Outcome Improvement Targets for each year

- DY3:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 54.9% (or 2.4% improvement over DY2 baseline)
- DY4:

- IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
    - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 57.1% (or 4.6% improvement over DY2 baseline)

- DY5:
    - IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate) (Non-Standalone)
        - Our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 59.3% (or 6.8% improvement over DY2 baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Dallas County, only 65% of individuals over the age of 18 received an influenza vaccination in the past 12 months.[497] The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Percent of Opportunities Achieved

Unique RHP Outcome Identification Number: 139485012.3.6

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

The disparity group for this metric is the underserved/uninsured population in Dallas County that has uncontrolled Asthma.

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of asthma opportunities completed/fulfilled
- Denominator: Asthma appropriate opportunities x number of asthma patients

By the end of the waiver, our goal is to have achieved a 40.0% (or 10% improvement over baseline) percent of opportunities achieved for the Baylor Health Care System Asthma Percent of Opportunity Achieved (POA). This is an aggressive 10% improvement target over baseline. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

At Baylor Health Care System, we have a standard Asthma POA which consists of: documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We measure this yearly for our Asthma patients and calculate POA by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population.

POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period.

For an illustrative example: For Asthma- there are 4 potential opportunities (i.e. metrics) per patient (1) documentation of Action/Mgmt Plan, 2) Severity Assessment, 3) Controller Therapy for those who are eligible, and 4) Spirometry within last two years). The denominator would be # of patients x 4. So, for example, if there are 10 patients x 4 opportunities each = 40

opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 30% POA was achieved for Asthma patients

Outcome Improvement Targets for each year

- DY3:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 33.5% (or 3.5% improvement over baseline)
- DY4:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 36.8% (or 6.8% improvement over baseline)
- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Asthma Percent of Opportunities Achieved)
        - Our goal is to increase the POA % for Asthma patients to 40.0% (or 10% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Pulmonologists should handle more complex cases but also use this opportunity to help educate the underserved population (especially Hispanics and African Americans) about the importance of screenings/prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

We plan on measuring the improvement in Asthma for Baylor Clinic patients. At Baylor Health Care System, we have a standard Asthma Percent of Opportunities Achieved which consists of:

documentation of Action/Mgmt Plan, Severity Assessment, Controller Therapy for those who are eligible, and Spirometry within last two years. We feel that this measure is a comprehensive way to measure the patients with Asthma in the Baylor Clinic and manage their condition holistically.

Asthma affects about 19.6% of the Dallas County population and had approximately 1158 cases of hospitalization in 2010.[498] According to the Office of Minority Health, African Americans were 30% more likely to have Asthma than non-Hispanic whites and were three times more likely to die from an Asthma related issue than non-Hispanic whites. Hispanics are 30% more likely to visit the hospital for Asthma than non-Hispanic whites.[499]

A study by Meng, Leung, et. al found that patients with Asthma that saw a specialist had higher rates of compliance because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients leading to better quality outcomes and long(er) term control[500]. Making the pulmonologist a part of our Asthma patients' care team will help to avoid exacerbations, prevent complications and reduce hospitalizations.

Many of the underserved patients in the region require specialty care related to chronic diseases. Lack of timely access to needed care often results in clinical exacerbations and worsening of their health conditions. This can be avoided or lessened through improved access. A study conducted in 2010 by Bellinger, et al. confirmed that minority and underserved populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.[501]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 139485012.3.7

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-12.2: Cervical Cancer Screening (HEDIS 2012) *(Non-standalone measure)*

- Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.
- Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

As part of preventive care and screenings, cervical cancer screening is a standard practice that PCP/PCMHs provide for their patients. Education and regular exams can be the difference between early detection and death. By the end of the waiver, our goal is to have > 73.3% (or 4.4% improvement over baseline) of patients who are Baylor Clinic at Baylor University Medical Center be screened for Cervical Cancer. This is a 4.4% improvement over baseline. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 68.9% of patients at the Baylor Clinic at Baylor University Medical Center have had a Cervical Cancer screening

Outcome Improvement Targets for each year

- DY3:
  - IT-12.2: Cervical Cancer Screening
    - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 70.5% (or 1.6% improvement over baseline)
- DY4:
  - IT-12.2: Cervical Cancer Screening

        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 71.9% (or 3% improvement over baseline)
- DY5:
    - IT-12.2: Cervical Cancer Screening
        - Our goal is increase the % of patients that have received a Cervical Cancer screening to at least 73.3% (or 4.4% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that OB/GYNs should handle more complex cases but also use this opportunity to help educate underserved women about the importance of screenings and prevention.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period. In Dallas County approximately the incidence rate of cervical cancer is 9.7 per 100,000.[502] According to the National Cancer Institute, African American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women[503]. There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a PCP/PCMH setting.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome ,involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-Standalone Measure)

Unique RHP Outcome Identification Number: 139485012.3.8

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)

- Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years

- Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

By the end of the waiver, our goal is to have > 56.3% (or 7.3% improvement over baseline) of patients who are Baylor Clinic patients at Baylor University Medical Center be screened for Colorectal Cancer. This is an improvement of 7.3% over baseline. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that only 49.0% of patients at the Baylor Clinic at Baylor University Medical Center had a Colorectal Cancer Screening

Outcome Improvement Targets for each year

- DY3:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 51.6% (or 2.6% improvement over baseline)
- DY4:

- IT-12.3 Colorectal Cancer Screening
  - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 54.0% (or 5.0% improvement over baseline)

- DY5:
  - IT-12.3 Colorectal Cancer Screening
    - Our goal is increase the % of patients that have received a Colorectal Cancer screening to at least 56.3% (or 7.3% improvement over baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Gastroenterologists should handle more complex cases but also use this opportunity to help educate underserved adults about the importance of screenings and prevention. The Baylor Clinic is currently only at a 49% completion rate and will need the help of their specialist partners to meet these goals.

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Metrics selected were based on historical data from similar programs with specialty care providers that showed material improvement in a 2-3 year time period.

In Dallas County less than 60% of individuals 50 and over have had a sigmoidoscopy or colonoscopy examination. The colorectal cancer incidence rate is 43.3 cases per 100,000 people. 60% of deaths due to colorectal cancer can be avoided.[504] There is a definite need for these services in Dallas County and the Baylor Clinic plans to provide these screenings to a greater number of people. According to the Centers for Disease Control and Prevention, Hispanics and African Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.[505] There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Dallas County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome

[504] Healthy People North Texas: http://www.healthyntexas.org
[505] Centers for Disease Control and Prevention: http://www.cdc.gov

involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes Care: HbA1c poor control (> 9.0%)- NQF 0059 (Standalone measure)

Unique RHP Outcome Identification Number: 139485012.3.9

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-1.10 Diabetes care: *HbA1c poor control (>9.0%) (Standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have < 14.9% (or minimum of 2.5% reduction over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. The additional qualifiers for this metric are the following: 1) a patient has been engaged in chronic care management for at least 6 months, 2) Two HbA1c measures will be taken per patient and the most recent HbA1c score will be used for reporting.

One of the outcome measures we have chosen for our chronic care management program is HbA1c performance, as determined by a reduction in poor control, defined as the percent of the population with HbA1c > 9.0%. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish Baseline Rates
        - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 17.4% of patients at the Baylor Clinic at Baylor University Medical Center have an HbA1c > 9.0%

Outcome Improvement Targets for each year

- DY3:
    - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)

        - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 16.5% (or minimum of 0.9% reduction over baseline)
- DY4:
    - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
        - Our goal is to reduce the HbA1c > 9.0% rate to ≤ 15.7% (or minimum of 1.7% reduction over baseline)
- DY5:
    - IT-1.10: Diabetes Care: HbA1c poor control (> 9.0%)
        - Our end goal is to have the HbA1c > 9.0% rate be ≤ 14.9% (or minimum of 2.5% reduction over baseline)

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

In Dallas County, more than 11.4% of the population has a diagnosis of Diabetes.[506] Traditionally, the underserved population does not have access to the necessary medications and supplies to manage their diabetes thus many patients go undiagnosed or have poor glucose control. Lack of proper education coupled with a lack of primary care attention often leads to more severe complications and poor health outcomes for those with diabetes. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions.

Bodenheimer, et. al, found that patient self management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients.[507] A recent of edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs.[508] Focusing efforts on improving glycemic control should result in reduced co-morbid conditions and improved complication rates for these patients. We expect that at least 5-7% of patients that are seen regularly in a Baylor Clinic will have improved HbA1c levels.

Title of Outcome Measure (Improvement Target): IT-1.11 Diabetes Care: BP control (<140/80 mmHg) NQF 0061 (Standalone measure)

Unique RHP Outcome Identification Number: 139485012.3.10

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-1.11 Diabetes care: *BP control (<140/80mm Hg)- (Standalone measure)*

- Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the waiver, our goal is to have > 49.4% (or 7.2% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) under BP control (< 140/80 mmHg). This is a 7.2% improvement over baseline. This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program for at least 6 months. Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 49.4% of patients with diabetes at the Baylor Clinic at Baylor University Medical Center have BP less than 130/80 mmHg. At Baylor University Medical Center Medical Center, we have been historically defining uncontrolled BP > 130/80 mmHg, we will have to adjust our tracking for this project.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.11: Diabetes Care: BP control (<140/80 mmHg)

        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 51.9% (or 2.5% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program
- DY4:
    - IT-1.11: Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 54.3% (or 4.9% improvement over baseline) (or of patients at the Baylor Clinic who have engaged in the chronic care management program
- DY5:
    - IT-1.11: Diabetes Care: BP control (<140/80 mmHg)
        - Our goal is increase the % of patients in good BP control (<140/80 mmHg) to 56.6% (or 7.2% improvement over baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

We will have to review our baseline numbers in DY2. Historically, in our E.H.R we have been tracking BP control as < 130/80 mmHg. In order to meet the requirements of this project, we will have to re-analyze the numbers and re-establish our new baseline.
As part of the standard of care for diabetes management, optimal blood pressure control is an included component of this protocol. At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other co-morbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et. al showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients[509]. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic-based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

Outcome Measure Valuation

[509] Cushman WC, Evans, GW, et. al Effects of intensive blood pressure control in type 2 diabetes mellitus. N Engl J Med. 2010. Apr 29; 362(17): 1575-85

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.13 Diabetes Care: Diabetes care: Foot exam- NQF 0056

Unique RHP Outcome Identification Number: 139485012.3.11

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-1.13 Diabetes care *Foot exam- (Non- standalone measure)*

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

By the end of the waiver, our goal is to have > 90.4% (or 3.6% improvement over baseline) of patients 18-75 years old with diabetes (type 1 or type 2) receive a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year(s). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will confirm and establish our baseline. A preliminary E.H.R data analysis shows 86.8% of diabetic patients that are seen by a diabetes educator at the Baylor Clinic at Baylor University Medical Center receive a foot exam

Outcome Improvement Targets for each year

- DY3:
  - IT-1.13: Diabetes Care: Foot exam
    - Our goal is to increase this rate to at least 88.1% (or 1.3% improvement over baseline) of diabetic patients receiving a foot exam
- DY4:
  - IT-1.13: Diabetes Care: Foot exam

        - Our goal is to increase this rate to at least 89.3% (or 2.5% improvement over baseline) of diabetic patients receiving a foot exam

    - IT-1.13: Diabetes Care: Foot exam
        - Our goal is to increase this rate to at least 90.4% (or 3.6% improvement over baseline) of diabetic patients receiving a foot exam

Rationale

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical data from similar programs that showed material improvement in a 2-3 year time period.

An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues. This is better utilization and management of resources through early identification and prevention of serious diabetes foot related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation.[510]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in Clinical Indicator in Identified Disparity Group. Clinical indicator to be improved and disparity group to be determined by provider.

Unique RHP Outcome Identification Number: 139485012.3.12

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
- Denominator: Total number of patients with a Behavioral Health intervention/ encounter

One of the outcome measures we have chosen for our behavioral health program is to improve Baylor's standard diabetes Percent of Opportunities Achieved (POA) which consists of HbA1c, LDL, BP control for patients who have engaged in our behavioral health program. POA is similar in nature to an improvement bundle, but differs slightly in the way it is calculated. Here, we define the disparate population as the underserved individuals in Dallas County that have both a diagnosis of diabetes and a behavioral health issue.

By the end of the waiver, our goal is to have > 15% of patients who have had a behavioral health intervention/encounter to have improvement in our Diabetes POA (HbA1c, LDL, BP, etc) that have uncontrolled values for these measures and have an identified behavioral health issue.

- HbA1c < 8%
- LDL < 100
- BP < 130/80 mmHg

Baylor's standard diabetes POA (HbA1c, LDL, BP) is measured by using percent of opportunities achieved (POA). We plan on measuring the improvement in Diabetes for Baylor Clinic patients that receive behavioral health treatment. The Diabetes POA which consists of: LDL, BP and HbA1c control is measured yearly for our diabetic patients. The POA is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population.

POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from "bundle" performance which is usually an all-or-none metric calculating the percentage of patients who've achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means

the clinic was successful in achieving 10% more processes/targets for their diabetes patients than in the prior reporting period.

For an illustrative example: For Diabetes- there are 3 opportunities (i.e. metrics) per patient (1) A1c < 8, 2) LDL < 100, 3) BP < 130/80 mmHg). The denominator would be # of patients x 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 77% achievement.

We define this outcome in the following way:
Numerator: Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
Denominator: Total number of patients with a Behavioral Health intervention/ encounter

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will establish a baseline of current status of the Diabetes POA for patients that have a reported behavioral health issue
- DY3:
  - P-2: Establish Baseline Rates
    - We will compare the DY2 baseline rate to results in DY3 to measure change refine data collection processes if necessary

Outcome Improvement Targets for each year

- DY3:
  - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
    - We will improve the Diabetes POA for 5% of patients who have had at least one behavioral health intervention/encounter in one year
- DY4:
  - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients)
    - We will improve the Diabetes POA for 10% of patients who have had at least one behavioral health intervention/encounter in one year

- DY5:
    - IT-11.1 Improvement in Clinical Indicator in identified disparity group (Diabetes Percent of Opportunities Achieved in Behavioral Health patients
        - We will improve the Diabetes POA for 15% of patients who have had at least one behavioral health intervention/encounter in one year

Rationale

Category 3 metrics for this project were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to recognize and increase awareness of patients who have co-occurring behavioral health and diabetes health issues. By recognizing this, we believe we can positively impact diabetes outcomes by addressing underlying behavioral health issues that patients may have.

In DY2, we will collect our baseline information about the status of the Diabetes POA (HbA1c, LDL, BP) for patients who have a documented behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.
In Region 9, there is a 36% increase in average charges per encounter for those individuals with a co-occurring behavioral health issue and chronic disease. 100% of the frequent flyers had a co-occurring mental illness and cost the Region over $26 million dollars.[511]

A recent study conducted in early 2012, by Jeffery Johnson, et. al showed a direct correlation between diabetes and depression. They cited that depression is the most common co-morbid condition present in 15-30% of patients with Type 2 diabetes and less than 50% are recognized as having depression. Depression is associated with poorer self care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health

[511] RHP 9 Community Health Needs Assessment

issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.[512]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. (**Non-standalone measure**)

Unique RHP Outcome Identification Number: 139485012.3.13

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. *(Non-standalone measure)*

- Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
- Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

One of the outcome measures we have chosen for our behavioral health program is to increase the number of patients in the underserved population who have improved utilization rates for receiving behavioral health treatments/interventions. The subset of the target population that suffers from mental health issues is prevalent in the region. Only 19.8% of underserved patients receive behavioral treatment in the same setting as their primary care.[513] The disparate population that we will be focusing on is the underserved/uninsured patients in Dallas County with behavioral health needs.

By the end of the waiver, our goal is to have > 20% of patients who are eligible to participate in the behavioral health program, engage in the program.

We define this outcome in the following way:

Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

The idea of this metric is that by engaging patients in behavioral health treatment/ interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least two behavioral health interventions/encounters in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self- identified need or 3) provider/clinician identification of patient need for behavioral health counseling. This Outcome Measure is different than the Improvement Milestone we proposed

[513] RHP 9 Community Health Needs Assessment

in our Category 2 Project Table because Outcome Measure 11.3 focuses on utilization of the behavioral health service, entailing that an "engaged" patient is one that has had at least two behavioral health encounters/interventions in the past 12 months. The Improvement Milestone in the project table is a volume metric focused on enrolling the patient in a Behavioral Health program. This Outcome Measure takes this one step further by requiring at least two visits in the past 12 months.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish Baseline Rates
    - We will establish a baseline of how many patients have a behavioral health issue (substance abuse, anxiety, depression, other) based on our E.H.R, self-reported or clinician reported status.
- DY3:
  - P-2: Establish Baseline Rates
    - We will compare our DY2 baseline analysis to DY3 to determine if any improvements need to be made to the data collection process and to capture any variances between the two data sets

Outcome Improvement Targets for each year

- DY3:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 10%
- DY4:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 15%
- DY5:
  - IT-11.3: Improve utilization rates of clinical preventive services
    - We will improve behavioral health treatment rates by 20%

Rationale

Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting.

Our main goal by selecting this outcome was to demonstrate increased access and utilization of the behavioral health program we are proposing.
In DY2, we will collect our baseline information about the number of patients who have a behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will be reporting for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. Title of Outcome Measure (Improvement Target): IT-5.1 Improved Cost Savings: Demonstrate cost savings in care delivery (Non-Standalone measure)

Unique RHP Outcome Identification Number: 139485012.3.14

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (*Standalone measure for Project 2.5 only. For all other projects –Non- standalone measure)*

- Type of analysis to be determine by provider from the following list: Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis

By the end of the waiver, our goal is to have > 30% cost savings in health care services utilization (through fewer ED visits and less overall utilization) for patients who have engaged in our care navigation program and have a confirmed appointment with a PCP/PCMH.

One of the outcome measures we have chosen for our care navigation program is to improve cost savings in the healthcare delivery system for those patients that have been served by the care navigation program.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish Baseline Rates
        - In DY2 we will establish a baseline of average cost savings incurred by patients who have been seen by the care navigation program while in the ED and have a confirmed appointment with a PCP/PCMH. We will compare pre and post utilization patterns of enrolled patients to determine the total cost savings incurred (inpatient and outpatient) per patient. For example, if prior to being seen by our care navigation program, a patient's total cost utilization was $10,000 we anticipate that after being connected to the appropriate resource and being seen for an appointment that over the course of 1 year, total costs would decrease by 20% (DY4) to $8,000.

Outcome Improvement Targets for each year

- DY3:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 15% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- DY4:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 20% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- DY5:
    - IT-5.2: Improved Cost Savings
        - We aim to improve cost savings for those patients that have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 25% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year

Rationale

In DY2, we plan to do some in depth utilization analysis to determine a baseline of what the cost utilization patterns are for patients seen at Baylor University Medical Center. This, based on our historical experience with similar programs on other campuses, we anticipate a 15%, 20% and 25% cost savings over the subsequent years in total cost of care savings.

The reason we chose this metric is because financial constraints are a main concern for the Region in being able to provide high quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor's office for $56.21 (including lab and x-ray) costs $193.92 in the Emergency room[514]. This cost differential multiplied by the 443,000 uninsured in Dallas County creates a significant cost to the county and Region.

Outcome Measure Valuation

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization (**Standalone measure**)

Unique RHP Outcome Identification Number: 139485012.3.15

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Measure Description

IT-9.2 ED appropriate utilization *(Standalone measure)*

- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-N/A
- Reduce Emergency Department visits for target conditions
    - Congestive Heart Failure
    - Diabetes
    - End Stage Renal Disease
    - Cardiovascular Disease/Hypertension
    - Behavioral Health/Substance Abuse
    - Chronic Obstructive Pulmonary Disease
    - Asthma

By the end of the waiver, our goal is to have > 35% reduction in inappropriate ED utilization for all causes and > 20% reduction in inappropriate ED utilization for targeted conditions: CHF, Diabetes, ESRD, CVD/Hypertension, Behavioral Health/Substance Abuse, COPD and Asthma

One of the outcome measures we have chosen for our care navigation program is to reduce ED utilization. The protocol mentions three parts to this metric:

7) Reduce all ED visits (including ACSC)
8) Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-*we will not be measuring this outcome as we do not see pediatric patients at Baylor University Medical Center*
9) Reduce ED visits for target conditions
    a. CHF
    b. Diabetes
    c. ESRD
    d. CVD/Hypertension
    e. Behavioral Health/Substance Abuse
    f. COPD

g. Asthma

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-3: Establish Baseline Rates
    - We will establish a baseline for the aforementioned components of the improvement metric (less #2- pediatric ED visits) and determine the full opportunity for improvement
- DY3:
  - P-3 Establish Baseline Rates
    - We will conduct a comparison between DY2 and DY3 to determine the change in rates for ED utilization and utilization of targeted conditions and determine any seasonality or variations in data collection/trends

Outcome Improvement Targets for each year

- DY3:
  - IT-9.2: ED Appropriate Utilization
    - We aim to reduce all ED visits by 25% and ED visits for targeted conditions by 10%
- DY4:
  - IT-9.2: ED Appropriate Utilization
    - We aim to reduce all ED visits by 30% and ED visits for targeted conditions by 15%
- DY5:
  - IT-9.2: ED Appropriate Utilization
    - We aim to reduce all ED visits by 35% and ED visits for targeted conditions by 20%

Rationale

Baylor University Medical Center sees very few children, thus metric 2 is not applicable to this project. We do not see enough pediatric patients to make a material impact on the ED utilization rate for this population. Historically, we have not tracked the ED utilization for targeted conditions (i.e. CHF, Diabetes, etc), for this type of project thus we do not have a

baseline measurement for these specific diseases. We plan to measure these in DY2 and DY3 and target a modest improvement of ED utilization in the subsequent years.

According to the Community Health Needs Assessment of Region 9, 68% of ED visits were preventable/ treatable in an outpatient setting[515]. The stakeholder survey conducted amongst performing providers also indicated that there is a significant overuse of emergency department services due to patients' inability to access primary care. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Dallas County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as "hot spotting" indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues[516]. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP Outcome Identification Number: 139485012.3.16

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-10.1: Quality of Life *(Standalone measure)*

Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Quality of Life tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. We do not currently utilize Quality of Life surveys. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that that Quality of Life indicators such as depression and cognition exams improve over time with home visits.

Outcome Improvement Targets for each year

- DY3:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.

- DY4:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.
- DY5:
    - IT-1.10: Quality of Life (Standalone)
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Quality of Life assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Quality of Life assessments such as the SF-36 or AQoL measure components such as: illness, independent living, social relationships, physical senses and psychological wellbeing and will be important to measure in the high risk and vulnerable patients we intend to serve.[517] Understanding social and physical attributes of the patient will be essential in determining their feasibility of following protocols and regimens that will optimize their healthcare. We plan on conducting a QOL assessment every 6 months on patients who have been in the program for at least 6 months. Improvement will be measured from the time the patient is enrolled to time of survey administration.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-10.2 Activities of Daily Living

Unique RHP Outcome Identification Number: 139485012.3.17

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-10.2: Activities of Daily Living *(Standalone measure)*

Demonstrate improvement in ADL scores, as measured by evidence based and validated assessment tool, for the target population.

By the end of the waiver, our goal is to improve the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
        - We will determine the Activities of Daily Living tool that will be used for this outcome
    - P-2: Establish baseline rates
        - We will confirm and establish our baseline. In a transitional care program for the elderly currently in existence at Baylor Health Care System, clinicians site that ADL improvement in the elderly population improves where patients go from partial dependence to independence.

Outcome Improvement Targets for each year

- DY3:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 3% over DY2.

- DY4:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 5% over DY2.
- DY5:
    - IT-10.2: Activities of Daily Living *(Standalone measure)*
        - Our goal is to increase the mean score (average change from patient enrollment to most recent survey) on Activities of Daily Living assessments for patients who have been in the Vulnerable Patient Network (Home Visits) program for at least 6 months at the time of survey administration by at least 7% over DY2.

Rationale

Measurement of the activities of daily living is critical because they have been found to be significant predictors of paid home care , use of hospital services, living arrangements, use of physician, insurance coverage and mortality.[518] While ADLs are typically used with the elderly population, the complexity and nature of the high risk uninsured/Medicaid patients warrants this assessment as well. Monitoring the progress or decline of factors such as bathing, feeding, continence, transferring, toileting and dressing are immediate predictors of any issues or barriers that patients may be experiencing.[519] We may need to consider using the Lawton IADL scale for this population as it involves more complex activities such as: shopping, laundry, responsibility for own medications, etc.[520] We plan on conducting the ADL assessment every 6 months and patients that have been in the program for 6 months. The improvement will be measured from the time that patients enroll in the program to survey conduction.

Outcome Measure Valuation

Title of Outcome Measure (Improvement Target): IT-1.2 Annual monitoring for patients on persistent medication– angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)

Unique RHP Outcome Identification Number: 139485012.3.18

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-1.2: Annual monitoring for patients on persistent medications angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (*Non- standalone measure*)

Demonstrate improvement in quality of life (QOL) scores, as measured by evidence based and validated assessment tool, for the target population.
Percentage of members 18 years of age and older who received at least 180 treatment days of ACE inhibitors or ARBs during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on an ACE/ARB inhibitor are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:

- P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- P-2: Establish baseline rates
  - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on an ACE/ARB inhibitor. We do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.2: Annual monitoring for patients on ACE or ARBs (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients are on an ACE/ARB medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. In a recent study in the New England Journal of Medicine, compliance to anti-hypertensives was 41%, beta blockers was 49% and statins were 55% after a patient suffered from an AMI.[521] We believe through consistent, proactive management and encouraging patient accountability for taking medications, these rates should increase.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources.

[521] Choudhry, NK, Avorn, J, et. al. Full coverage for preventive medications after myocardial infarction. N Engl J Med 2011; 365:2088-2097

Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.4 Annual monitoring for patients on persistent medications diuretic *(Non- standalone measure)*

Unique RHP Outcome Identification Number: 139485012.3.19

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:
IT-1.4: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) diuretic *(Non- standalone measure)*

Percentage of members 18 years of age and older who received at least 180 treatment days of a diuretic during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Since we do not have a baseline for patients receiving a serum potassium, serum creatinine or blood urea nitrogen test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% or more patients on a diuretic are receiving a serum potassium/creatinine or BUN test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 33% of patients in Baylor Clinics are on a diuretic. We

do not have any data on how many of those patients received a serum potassium/creatinine or BUN test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.4: Annual monitoring for patients a diuretic (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum potassium/creatinine or BUN test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Approximately 33% of Baylor Clinic patients on a diuretic medication regimen. Enforcing annual monitoring will improve quality and reconcile the patient's medication to ensure it is still appropriate. A study that observed the correlation between a diuretic regimen and cardiovascular related hospitalizations found that patients who take the appropriate dose of diuretics at the appropriate time had a decrease risk of cardiovascular and heart failure related hospitalizations. A large component of the successful adherence was attributed to patient education and engagement in the medication regimen.[522]

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to

[522] Chui, M. A., Deer, M., Bennett, S. J., Tu, W., Oury, S., Brater, D. C. and Murray, M. D. (2003), Association Between Adherence to Diuretic Therapy and Health Care Utilization in Patients with Heart Failure. Pharmacotherapy, 23: 326–332. doi: 10.1592/phco.23.3.326.32112

determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.5 Annual monitoring for patients on persistent medications-anticonvulsant *(Non- standalone measure)*

Unique RHP Outcome Identification Number: 139485012.3.20

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-1.5: Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012) anticonvulsant *(Non- standalone measure)*

Percentage of members 18 years of age and older who received at least 180 treatment days for an anticonvulsant during the measurement year and had at least one drug serum concentration level monitoring test for the prescribed drug in the measurement year.

Since we do not have a baseline for patients receiving a serum concentration test during the measurement year, we are proposing the following tiers of improvement:

- If 25-50% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 10% in DY4 and 15% in DY5 (all over DY2 baseline)
- If 50-75% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 5% in DY3, 7% in DY4 and 9% in DY5 (all over DY2 baseline)
- If 75-90% of patients on an anticonvulsant are receiving a serum concentration test within one year then our improvements will be 2% in DY3, 4% in DY4 and 6% in DY5 (all over DY2 baseline)
- If 90% of patients on an anticonvulsant are receiving a serum concentration test within one year then we will not pursue this outcome improvement and will defer to using only IT-1.19 Antidepressant Medication Management (Standalone)

Process Milestones

- DY2:
    - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
    - P-2: Establish baseline rates
        - We will establish our baseline rate. Based on clinician input, we believe about 5% of patients in Baylor Clinics are on an

anticonvulsant. We do not have any data on how many of those patients received a serum test in the past year.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum concentration test in the past year to 2% or 5% depending on baseline established in DY2
- DY4:
  - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum concentration test in the past year to 4%, 5% or 10% depending on baseline in DY2
- DY5:
  - IT-1.5: Annual monitoring for patients an anticonvulsant (Non-Standalone)
    - Our goal is increase the % of patients that have had a serum concentration test in the past year to 6%, 9% or 15% depending on the baseline in DY2

Rationale

Only about 5% of Baylor Clinic patients are on an anticonvulsant medication regimen. This may be because there are no formal behavioral health programs in the Baylor Clinic, it is possible that identification of BH issues is low and utilization of anticonvulsants would increase with an increased emphasis on identifying BH issues. A study in Psychiatric Services found that 50% of patients that were given anticonvulsant prescriptions to treat bipolar disorder were non-adherent.[523] This issue can be resolved by explaining the risks v. benefits for taking an anticonvulsant.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and

[523] Sajattovic, M, et. al. Treatment adherence with lithium and anticonvulsant medications among patients with bipolar disorder. *Psychiatric Services*. 58(6):855-63. 2007.

hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): IT-1.19 Antidepressant Medication Management *(Standalone measure)*

Unique RHP Outcome Identification Number: 139485012.3.21

Performing Provider Name/TPI: Baylor University Medical Center/139485012

Outcome Description:

IT-1.19: Antidepressant Medication Management - NQF 0105237 *(Standalone measure)*

Numerator:
A) Effective Acute Phase Treatment: At least 84 days (12 weeks) of continuous treatment with antidepressant medication during the 114-day period following the IPSD (inclusive). The continuous treatment allows gaps in medication treatment up to a total of 30 days during the 114-day period. Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, there may be no more than 30 gap days. Count any combination of gaps (e.g., two washout gaps of 15 days each, or two washout gaps of 10 days each and one treatment gap of 10 days).

B) Effective Continuation Phase Treatment: At least 180 days (6 months) of continuous treatment with antidepressant medication (Table AMM-D) during the 231-day period following the IPSD (inclusive). Continuous treatment allows gaps in medication treatment up to a total of 51 days during the 231-day period. Gaps can include either washout period gaps to change medication or treatment gaps to refill the same medication. Regardless of the number of gaps, gap days may total no more than 51. Count any combination of gaps (e.g., two washout gaps, each 25 days or two washout gaps of 10 days each and one treatment gap of 10 days).

Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year.

***Note** because this project will occur in an ambulatory setting, we will need to modify the denominator to more accurately measure the impact of this outcome. Instead of members discharged from an acute inpatient setting with a mental health diagnosis (as many of these patients may not come to a Baylor Clinic), we propose changing the denominator to all patients at a Baylor Clinic on the Baylor University Medical Center campus with an identified mental health issue and on a psychiatric medication.

We do not have an established baseline of tracking patients who received Acute Phase/Continuation phase treatment with antidepressants. Based on the baseline analysis in DY2, we may have to reevaluate or modify this outcome.

Process Milestones

- DY2:
  - P-1: Project Planning- engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
  - P-2: Establish baseline rates
    - We will establish our baseline rate. Based on clinician input, we believe about 20% of patients in Baylor Clinics are on an antidepressant. We do not have any data on how many of those patients received acute/continuous phase treatment.

Outcome Improvement Targets for each year

- DY3:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 5%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 3%
- DY4:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 10%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 5%
- DY5:
  - IT-1.19: Antidepressant Medication Management (Standalone)
    - Our goal is increase the % of patients that have are engaged in Effective Acute Phase Treatment by 15%
    - Our goal is to increase the % of patients that have engaged in Effective Continuous Phase Treatment by 7%

Rationale

Approximately 20% of Baylor Clinic patients on an antidepressant medication regimen. According to the Community Health Needs Assessment, behavioral health is a major issue in the

region. The top 10 utilizers in the region had BH related issues.[524] While antidepressants are not the solution to this problem, managing depression can have other positive ancillary effects on clinical adherence and avoidance of BH exacerbations. This outcome enforces both short and long term adherence to this drug in order to avoid adverse events for patients. An article in the Journal of Clinical Psychiatry, evidence was found "…to support collaborative care interventions in a primary care setting demonstrated significant improvements in antidepressant drug adherence during the acute and continuous phase of treatment and were associated with clinical benefit, especially in patients suffering from major depression and were prescribed adequate dosages of antidepressant medication.[525]" Our project supports this methodology.

Outcome Measure Valuation

Approach/Methodology: In one of the RHPs that Baylor Health Care System is participating in, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence based resources. Additionally, based on the weighted criteria we used to determine the funding allocation for each Category and 1 and 2 project, the same weight was used to determine the total Category 3 funding. From there, based on the complexity, difficulty of achieving a particular outcome, involvement/resources required, we individually weighed each of the outcomes for a project to determine the value for the milestones and metrics. Outcomes such as diabetes and hypertension improvement were weighted more than outcomes such as patient satisfaction or diabetic foot exams because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have.

Title of Outcome Measure (Improvement Target): ED Appropriate Utilization

Unique RHP project identification number: 138910807.3.1

Performing Provider Name/TPI: Children's Medical Center/138910807

Outcome Measure Description

Category 3 – OD-9 Preventive and Primary Care)

- IT-9.2 Reduce pediatric Emergency Department visits

Decrease inappropriate Emergency Department use by expanding access to pediatric primary care by opening additional MyChildren's primary care locations, establishing a primary care and care coordination service for children with complex chronic illness and using telemedicine in school settings to gain access to pediatric primary care and low complexity specialty pediatric services.

Process Milestones

- **DY2:**
  - **Milestone 1 P1:** Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans.
  - **Milestone 2 P2:** Establish baseline rates
  - **Milestone 3 P3:** Develop and test data systems
- **DY3:**
  - **Milestone 4 P4:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  - **Milestone 5 P5:** Disseminate findings, including lessons learned and best practices to stakeholders.

Outcome Improvement Targets for Each Year:

- **DY4:**
  - **Milestone 6 IT 9.2:** Achieve 5% reduction in Emergency Department use, for patients enrolled in MyChildren's, complex chronic service or receiving care through telemedicine services in the schools for the entire DY4 timeframe compared to DY3 Emergency Department use for the same patient cohort.
- **DY5:**

- **Milestone 7 IT 9.2:** Achieve 10% reduction in Emergency Department use, for patients enrolled in MyChildren's, complex chronic service or receiving care through telemedicine services in the schools for the entire DY4 and DY5 timeframe compared to DY3 Emergency Department use for the same patient cohort.

Rationale

Improving access to primary care by opening new pediatric primary care offices, providing a medical home for children with complex and chronic medical conditions and providing telemedicine services through school settings for primary and low complexity specialty care for children should reduce inappropriate use as well as overall use of Emergency Department services. Process and improvement milestones were selected to support the successful implementation of the project.

Project Valuation

This project was valued using the score for project 1.1 which was valued using the RHP 9 Scoring Criteria Guidance with a 1 to 9 scoring range and a weighted score based on:

	Weight	Score (1-9)	Weighted Score
Transformational Impact	20%	9	1.80
Population Served / Project Size	25%	8	2.00
Alignment with Community Needs	20%	9	1.80
Cost Avoidance	15%	8	1.20
Sustainability	15%	8	1.20
Partnership Collaboration	5%	8	0.40
	100%		8.40

Scoring Guidance:

Scoring Grid		General Scoring Frame
High	9	Exceptionally strong with essentially no weaknesses
	8	Extremely strong with negligible weaknesses
	7	Very strong with only minor weaknesses
Medium	6	Strong but with numerous minor weaknesses
	5	Strong but with at least one moderate weakness
	4	Some strengths but also some moderate weaknesses
Low	3	Some strengths but with at least one major weakness
	2	A few strengths and a few major weaknesses
	1	Very few strengths and numerous major weaknesses

Minor Weakness: Easily addressable weakness, does not substantially lessen impact

Moderate Weakness: Lessens impact

Major Weakness: Severely limits impact

Each point on the scale was given a value of $1,609,640 based on expected savings, improved outcomes and improved satisfaction with the healthcare system of the life of the project and beyond the life of the project as all patients are pediatric with expected impact to continue into adulthood. The overall project value was then divided between Category 1, 2 and 3 based on HHSC guidelines with Category 4 being allotted the maximum 15% in later years by reporting on the optional Domain 6.
